Blind. gin; because by these instruments he may be made more easily acquainted with the extent of musical scales, with the powers of harmony, with the relations of which it is constituted, and of course with the theory of his art. It would be not only unnecessary, but impracticable, to carry him deep into the theory, before he has attained some facility in the practice. Let, therefore, his head and his hands (if we may use the expression), be taught to go *pari passu*. Let the one be instructed in the simplest elements, and the others conducted in the easiest operations, first: contemplation and exercise will produce light in the one and promptitude in the other. But as his capacity of speculation and powers of action become more and more mature, discoveries more abstract and retired, talks more arduous and difficult, may be assigned him. He should be taught the names and gradations of the diatonic scale, the nature and use of time, the diversity of its modes whether simple or mixed. He should be taught the quantity or value of notes, not only with respect to their pitch, but to their duration. Yet, let him be instructed not to consider these durations as absolutely fixed, but variable according to the velocity of the movements in which they are placed. Thus we reckon a semibreve equal to 4 vibrations of a pendulum; a minim to 2; a crotchet to 1, &c. But if the number of aliquot parts, into which a semibreve is divided, be great, and consequently the value of each particular part small, the minim, crotchet, quaver, &c. will increase in their intrinsic durations, though they must always preserve the same proportions relatively one to another. He should never be habituated to take a piece of music, either from the sound of a voice or an instrument. His companion ought to read the music by the names and values of its characters, with the same exactness as the words in any other language. When he becomes a considerable adept in the art, tangible signs may be invented, by which he may not only be enabled to read, but even to set, music for himself. Such exercises will render him infinitely more accurate, both in his principles and practice, than he would otherwise be.

There is a hint of such tangible signs given in Tanfure's musical grammar, p. 93, and which, though (like the rest of the book) obscure and indigested, may be improved and applied with advantage.

For the sake of those in whose hands it may not be, we quote the passage at length.

"As it is the pleasure of the Almighty, that some persons are destitute of *eye-sight*; in like manner it is his infinite goodness to make them a double amends another way, by giving them a greater share of memory, &c. whereby they become very dexterous in playing on musical instruments, mathematics, &c. as we may observe by Dr Stanley organist of St Andrew's Holburn in London, the blind professor of mathematics in the university of Cambridge, and many others too tedious here to mention, who were born *blind*, and never saw the least glance of light; yet God gave them such a light in *knowledge*, that they became the wonder of all such as had the benefit of seeing, &c.

"And as *blind persons*, at first, cannot possibly have so clear an idea of *notes* and *musical characters* as they that

55
Scheme of musical notation.

nd. that see them, until they are taught by a master or tutor; I have (for the good-will I bear to such unfortunate persons) contrived the following table; that, by *feeling*, they may understand notes, and learn any tune that shall be set them, in their master's absence. Blind

A New Music-TABLE for such as are BLIND.

EXPLANATION.

“ Let A—B be a smooth board, 3 or 4 feet long, 1 inch thick, and 9 inches wide, with 5 square ledges glued thereon, each being half an inch asunder, half an inch wide, and half an inch high; which rising ledges represent our 5 lines of music, and their spaces: and the two outward lines, being made a little lower, may serve as leger lines, on occasion. The cyphers represent so many holes bored into every line and space, half an inch asunder; wherein *pegs* of different shapes are to be set, to represent the several sorts of notes and characters of the tune: which pegs the blind person may know by feeling, as well as he does his keys of the organ or harpsichord: so that, by keeping his fingers on the 5 lines, he feels the several pegs as they come on, and are set to represent the several sorts of notes, on both line and space; whilst his right hand strikes the respective key, &c. he first knowing the names of all his keys, his lines, spaces, and the mark of every peg. Let each peg be about half an inch high, when set in very fast. [N. B. The blind person must first be taught the names of the above lines and spaces in both the treble and bass clefs; and that he must feel his treble with his right hand, and his bass with the left hand: each being contrary, as you may see by the letters of the above table, A and B; and must learn each part separate.]

“ Of pegs, he must have a great number of every sort, to set his tune with, which he may mark as follows:

- For a *Semibreve*, 4 top-notches.
- Minim*, 2 top-notches.
- Crotchet*, 1 top-notch.
- Quaver*, one corner cut off.
- Semiquaver*, 2 corners cut off.
- Demisemiquaver*, all 4 corners cut off.
- Rest*, a notch in the corner.
- A Flat*, 1 notch on the side.
- Sharp*, 2 notches on the side.
- Point*, 3 notches on the side.
- Bar*, a flat thin top.
- Repeat*, a sharp-pointed top, &c. &c. &c.

“ But it is best for every performer to make and mark his own pegs; and deliver them one

by one as they are called for by the person that sets his *tune*.”

Thus far our author. We have already complained, that Tansur's Musical Notation is imperfect; and perhaps every table or instrument of the same kind may be liable to the same censure, as not being comprehensive of all the characters in the written language of music, so that the blind reader may find no deficiency in acquiring any lesson: yet as the cushion of Mr Cheefe appears to have more powers than any other instrument for the same purpose that has hitherto occurred to our observation, though attended with many formidable objections, we here insert it. It may possibly, however, be best for every blind adept in the musical art, after being sufficiently instructed in its theoretical and practical principles, to invent for himself a table, by which may be expressed all the various phenomena of music, in which, by varying the forms and positions of his pegs, he may habitually associate them with sounds, durations, rests, intervals, chords, cadences, da capos, repeats, and all the various graces which give animation and expression to musical sounds: for thus, being the immediate creatures of his own imagination, they will more easily become familiar to his memory, and be more strongly and readily associated with the phenomena which they are intended to signify, than if he had assumed the inventions of any other.

Mr Cheefe's description of his machine for teaching music to people deprived of sight, and to enable them to preserve their compositions, in the act of copying, without the assistance of a copyist. — “ That part of the machine which represents the book, or paper, is a small cushion stuffed, on a little frame; along which, is sewed a number of pack thread strings at equal distances from each other; these represent the lines in a music book: the five which compose the stave, are made of large twine; and those which represent the leger or occasional lines, drawn through the heads of the notes, where the music exceeds the compass of the established stave, are made of small twine, and are on this machine of the same length as the others. 56
PL XXVIII,
fig. 9.

“ If the practitioner only wishes to write harpsichord music, the cushion may be what length he pleases, and about five or six inches wide: the strings must be sewed in the following order; beginning with the first

Blind. or lowest, near the edge of the cushion; four small ones, which correspond with the notes in the base of the instrument ff, rr, cc, ee: Next five large ones, for the staff which correspond with the lines in the book, or notes in the instrument, g, b, d, f, r; one small one, which represents the occasional line between the base and treble, or middle c; five large ones for the treble staff, which make the notes e, g, b, d, f; three small ones, which represent the ledger lines when the music goes in alt. These provide for the note a in alt, c in alt, and e in alt; in the space above which, next the edge of the cushion, the f in alt is wrote, when it is wanting, which completes the compass of the instrument.

“Those who only sing or play on single instruments, such as violins, &c. should have their cushions not above half the width of those before-mentioned, upon which there should be but one staff, and that in the following order:—Two small lines at bottom, five large ones in the middle, and three small ones at top. Neither of the outside lines of these small cushions should be sewed close to the edge, as there are notes supposed above and below. At either end of these small cushions, there should be a small wire staple, in order that any number of them may be combined together at pleasure, by running a rod through the staples: this will enable the practitioner to write what musicians call SCORE, in any number of parts he pleases; and by this means a thorough knowledge of the great works of Handel, and all other classical authors, may be acquired as well without sight as with it.

“The characters used to write on this machine are pins; some with two, three, or more heads; others bent in different forms—some, the heads taken off and the top beat flat; some of these are split; others the heads taken off, and placed near the middle. The bars are pieces of wire crooked at each end; a double bar is made by placing two single ones close together; a double sharp and double flat in the same manner.

“The characters are kept in a box in the same style as the printer keeps his types; each different compartment of which must be marked with a character in writing, signifying what each, contained in the several compartments, is intended to represent. That the master may be acquainted with them, the student must be taught to distinguish each of the characters contained in the box by the feel, as well as the names of each line and space upon the cushion. When he can do this readily, some music should be read to him, which it will be well for him to copy on the cushion: and when that is filled, let it be laid on the desk of the harpichord before him; and then by feeling over a passage or sentence at a time, and afterwards playing it, his playing always commencing with the beginning of the piece, or at some particular part of it, this will soon enable him to recollect the whole, when the hands are taken off the cushion, to play what has been last felt. One of those characters, called a direct, must be placed against the note to be next felt: This will enable the student to go on again, after playing, without any difficulty. The person who reads the music, must be instructed not to call the lines or spaces by the letters which distinguish them, lest confusion may ensue, every eighth being the same; but must read in the following manner: first the name of the character must be mentioned, whether minim, crotchet, or quaver,

Blind. &c. then the line or space; as for example, minim on the first line, crotchet on the first space, quaver on the second, &c. &c. When the music exceeds the compass of the staff, it must be particularly mentioned whether above or below, first calling the character, then the ledger line or space.

“The technical term at the beginning of each piece, is better remembered than wrote down on the machine: The accidental terms, which are best marked by placing some character, not much used, either above or below the note on which it happens, the ingenious mind will find out a method of doing for itself.

“This machine will not only teach music; but, calling the characters letters, any one will be enabled to spell, read, or write down his sentiments on any subject, and even convey them to his friend without the assistance of a secretary. Arithmetic may be also taught upon this machine; as by calling the dot 1, and the pause 10, a complete set of figures will be formed.

“*Explanation of the figures.* A, B, C, D, the form of the cushion, which in its full size is about three feet long, and five inches and three quarters wide, having thereon a representation of musical notes, shown by different pins stuck on it. The lines a, b, c, d, e, are of large packthread; and the lines, f, g, h, are of small twine.

“Pins, N^o 1. A semibreve. 2. A semibreve rest. 3. A minim. 4. A minim rest. 5. Dots. 6. A crotchet. 7. A crotchet rest. 8. A quaver. 9. A quaver rest. 10. A sharp. 11. A semiquaver. 12. A semiquaver rest. 13. A demiquaver. 14. A demiquaver rest. 15. A flat. 16. A demisemiquaver. 17. A demisemiquaver rest. 18. A femidemiquaver. 19. A femidemiquaver rest. 20. A natural. 21. Bars. 22. A direct. 23. A tye. 24. Bass. 25. Tenor cleff. 26. Treble cleff. 27. A repeat. 28. Pause. 29. This character placed on any line or space, signifies as many notes on that line or space as there are doubles on the pins; if turned upwards, it implies the same number ascending; if downward, that number descending. 30. A beat or inverted shake. 31. A shake; and where there is a dot placed over it, signifies a turned shake. Two dots placed over each other, above the notes, without this character, signify a turn only. 32. This character is used over the note to signify *forte*; and if a dot is placed above it, *fortissimo*: if the dot is placed above the note and below the character, it implies *resonante*; if the character is placed below the note, it signifies *piano*; and if a dot is placed under it, *pianissimo*; but if the dot is above the character, and below the note, it signifies *diminuendo*. In concertos, the inventor uses the same character placed above the note in the same manner, with two dots over it to signify *toote*; and below the notes, with two dots under it to signify *solo*: in vocal music, the same character above the notes, with three dots over it, signifies *symphony*; and below the notes, with three dots under it, signifies *song*.”

It is certain, that when playing concertos, or, if you please, when performing in *score*, the blind must depend upon memory, and upon memory alone: but happily their retentive powers are remarkably strong; and there are few pieces in music which will be found either too intricate to be acquired, or too long to be remembered, by a person deprived of sight. Mr Stanley, the gentleman

gentleman formerly mentioned by Tanfure, performs what is still more astonishing. If our information, which we cannot doubt, be true, he accompanies any lesson with a thorough bass, though he never has heard it before. We have never yet heard of any person, though blessed with the full use of sight, and with all the advantages accruing from it, who could thus anticipate harmony before the chords were founded, and accompany it in a manner suitable to its nature.

When he becomes a more profound theorist, if he has adopted the notion that music and geometry are congenial and inseparable (which, however, in our judgment is frivolous), he may peruse M. de M.'s Essay on Music, and Treydel's Theory and Practice of Music. But if he chooses to hear the same principles delivered without that unnecessary parade and ostentation of profundity, let him be instructed by D'Alembert (see the article Music in this Dictionary); by Rameau, in his principles of composition; and by Rousseau's Musical Dictionary (the substance of which is engrossed in the present Work, either under the respective detached articles, or in the notes added to the article Music). It is true, that the forms and proportions of instruments, the thickness, length, and tension of musical strings, may be mathematically adjusted; their relations one to another may be determined by the coincidence of their vibrations, or by the number and velocity of these vibrations when dissonant; but experience and a good ear are amply sufficient for these purposes. Yet, if the necessity of geometry in music should still remain an indelible article in his creed, he may peruse Dr Smith's Philosophical Principles of Harmony. There has also lately been published an explication of Tartini's theory, intitled, *The Principles and Power of Harmony*; which, after he has made considerable progress, may be read to him with sensible improvement.

c pu-
THUS we have endeavoured to form an estimate of the inconveniences suffered, and the advantages possessed, by the blind; we have attempted to show, of what kind of culture their remaining faculties are susceptible, and what appeared to us the easiest and properest means of their improvement. We have illustrated not only its possibility, but its certainty, by incontestable facts, which demonstrate, even in the eyes of scepticism and incredulity, to what degrees of eminence, both in the mechanical and liberal arts, the blind may be carried. It now remains to demand a categorical answer from society, Whether it is more humane and dignified, that such unhappy persons should be suffered to languish out their lives in torpid and miserable obscurity, wretched in themselves and burdensome to others; or to cultivate and improve their powers in such a manner, as that they may be qualified for internal enjoyment and public utility? Surely there is not a human being, who does not disgrace the works of God, that can be at any loss in answering this question. Have we not then a right to call the world to an account? have we not a right to demand, why rational beings susceptible of felicity in themselves, and capable of transfusing happiness through the societies with whom they are connected, should be abandoned to a state of insignificance and misery? Is it possible that men who are every moment subjected to the same contingencies with which they behold their fellow-creatures afflicted, should not

with all their souls endeavour to alleviate the misfortunes of their suffering brethren? Is the native and hereditary portion of human woe so light and supportable in itself, that we should neglect and despise those to whom it is embittered by accidental circumstances of horror and distress? You who are parents, who feel the strong and powerful pleadings of nature, do not, by a brutal negligence and insensibility, render the existence which you have given a curse to its possessors. Do not give them reason to upbraid your memory; and to answer those who ask what patrimony you have left them, that their sole inheritance was ignorance, incapacity, and indigence. You men of wealth and eminence, you whom Providence has rendered conspicuous on the theatre of nature, to whom it has given the noblest opportunities of participating the divine beatitude by the exercise of universal benevolence and genuine patriotism; yours is the glorious province of bringing neglected merit from obscurity, of healing the wounds inflicted by adverse fortune, and of cultivating these talents which may be excited for your own advantage and the honour of your species. Thus you shall rise in the heraldry of heaven, and your names diffuse a lustre through the extent of space and the archives of eternity. Otherwise the temporary glare and parade of your situation can produce nothing else but a despicable mimicry of real and intrinsic greatness, and are no more than a splendid mask to cover what in itself is infamous or detestable.

By way of appendix to the preceding article, we shall add one or two very singular histories, with which it is hoped our readers will not be displeased.

An account of some remarkable particulars that happened to a lady after having had the constant kind of small-pox. “ In the course of this disease, during which the lady was attended by the late Sir Hans Sloane, several threatening symptoms appeared, which however were at length overcome; and the patient being thought out of danger, took several doses of such purgative medicines as are usually administered in the decline of the disease, without any bad consequence.

“ But in the evening of the day on which she had taken the last dose that was intended to be given her on that occasion, she was suddenly seized with pains and convulsions in the bowels; the pain and other symptoms became gradually less violent as the force of the medicine abated, and by such remedies as were thought best adapted to the case, they seemed at length to be entirely subdued.

“ They were, however, subdued only in appearance; for at eleven o'clock of the forenoon of the next day they returned with great violence, and continued some hours; when they went off, they left the muscles of the lower jaw so much relaxed, that it fell down, and the chin was supported on the breast. The strength of the patient was so much exhausted during this paroxysm, that she lay near two hours with no other signs of life than a very feeble respiration, which was often so difficult to be discerned, that those about her concluded she was dead.

“ From this time the fits returned periodically every day, at about the same hour. At first they seemed to affect her nearly in the same degree; but at length all

Blind.

the symptoms were aggravated, the convulsions became more general, and her arms were sometimes convulsed alternately; it also frequently happened, that the arm which was last convulsed remained extended and inflexible some hours after the struggles were over. Her neck was often twisted with such violence, that the face looked directly backwards, and the back part of the head was over the breast; the muscles of the countenance were also so contracted and writhed by the spasms, that the features were totally changed, and it was impossible to find any resemblance of her natural aspect by which she could be known. Her feet were not less distorted than her head; for they were twisted almost to dislocation at the instep, so that she could not walk but upon her ancles.

“To remove or mitigate these deplorable symptoms, many remedies were tried; and, among others, the cold bath: but either by the natural effect of the bath, or by some mismanagement in the bathing, the unhappy patient first became blind, and soon afterwards deaf and dumb. It is not easy to conceive what could increase the misery of deafness, dumbness, blindness, and frequent paroxysms of excruciating pain: yet a very considerable aggravation was added; for the loss of her sight, her hearing, and her speech, was followed by such a stricture of the muscles of her throat, that she could not swallow any kind of aliment either solid or liquid. It might reasonably be supposed that this circumstance, though it added to the degree of her misery, would have shortened its duration: yet in this condition she continued near three quarters of a year: and during that time was supported in a very uncommon manner, by chewing her food only; which having turned often, and kept long in her mouth, she was obliged at last to spit it out. Liquors were likewise gurgled about in her mouth for some time; and then returned in the same manner, no part of them having passed the throat by an act of deglutition: so that whatever was conveyed into the stomach, either of the juices of the solid food, or of liquids, was either gradually imbibed by the sponginess of the parts, which they moistened, or trickled down in a very small quantity along the sides of the vessels.

“But there were other peculiarities in the case of this lady, yet more extraordinary. During the privation of her *sight* and *hearing*, her *touch* and her *smell* became so exquisite, that she could distinguish the different colours of silk and flowers, and was sensible when any stranger was in the room with her.

“After she became blind, and deaf, and dumb, it was not easy to contrive any method by which a question could be asked her, and an answer received. This however was at last effected, by talking with the fingers, at which she was uncommonly ready. But those who conversed with her in this manner, were obliged to express themselves by touching her hand and fingers instead of their own.

“A lady who was nearly related to her, having an apron on, that was embroidered with silk of different colours, asked her, in the manner which has been described, if she could tell what colour it was? and after applying her fingers attentively to the figures of the embroidery, she replied, that it was red, and blue, and green; which was true. The same lady having a pink coloured ribbon on her head, and being willing still fur-

Blind.

ther to satisfy her curiosity and her doubts, asked what colour that was? her cousin, after feeling some time, answered that it was pink colour: this answer was yet more astonishing, because it showed not only a power of distinguishing different colours, but different kinds of the same colour; the ribbon was not only discovered to be red, but the red was discovered to be of the pale kind called a *pink*.

“This unhappy lady, conscious of her own uncommon infirmities, was extremely unwilling to be seen by strangers, and therefore generally retired to her chamber, where none but those of the family were likely to come. The same relation, who had by the experiment of the apron and ribbon discovered the exquisite sensibility of her *touch*, was soon after convinced by an accident, that her power of *smelling* was acute and refined in the same astonishing degree.

“Being one day visiting the family, she went up to her cousin's chamber, and after making herself known, she intreated her to go down, and sit with her among the rest of the family, assuring her, that there was no other person present: to this she at length consented, and went down to the parlour door; but the moment the door was opened, she turned back, and retired to her own chamber much displeas'd; alleging, that there were strangers in the room, and that an attempt had been made to deceive her: it happened indeed that there were strangers in the room; but they had come in while the lady was above stairs, so that she did not know they were there. When she had satisfied her cousin of this particular, she was pacified; and being afterwards asked how she knew there were strangers in the room, she answered, by the smell.

“But though she could by this sense distinguish in general between persons with whom she was well acquainted and strangers, yet she could not so easily distinguish one of her acquaintance from another without other assistance. She generally distinguished her friends by feeling their hands; and when they came in, they used to present their hands to her, as a mean of making themselves known: the make and warmth of the hand produced in general the differences that she distinguished; but sometimes she used to span the wrist, and measure the fingers. A lady, with whom she was very well acquainted, coming in one very hot day, after having walked a mile, presented her hand as usual; she felt it longer than ordinary, and seemed to doubt whose it was; but after spanning the wrist, and measuring the fingers, she said, ‘It is Mrs M. but she is warmer to-day than ever I felt her before.’

“To amuse herself in the mournful and perpetual solitude and darkness to which her disorder had reduced her, she used to work much at her needle; and it is remarkable, that her needle-work was uncommonly neat and exact: among many other pieces of her work that are preserved in the family, is a pin-cushion, which can scarce be equalled. She used also sometimes to write; and her writing was yet more extraordinary than her needle-work: it was executed with the same regularity and exactness; the character was very pretty, the lines were all even, and the letters placed at equal distances from each other: but the most astonishing particular of all, with respect to her writing, is, that she could by some means discover when a letter had by some mistake been omitted, and would place it over that part

of the word where it should have been inserted, with a caret under it. It was her custom to sit up in bed at any hour of the night, either to write or to work, when her pain or any other cause kept her awake.

"These circumstances were so very extraordinary, that it was long doubted whether she had not some faint remains both of hearing and sight, and many experiments were made to ascertain the matter; some of these experiments she accidentally discovered, and the discovery always threw her into violent convulsions. The thought of being suspected of insincerity, or supposed capable of acting so wicked a part as to feign infirmities that were not inflicted, was an addition to her misery which she could not bear, and which never failed to produce an agony of mind not less visible than those of her body. A clergyman who found her one evening at work by a table with a candle upon it, put his hat between her eyes and the candle, in such a manner that it was impossible she could receive any benefit from the light of it if she had not been blind. She continued still at her work, with great tranquillity; till, putting up her hand suddenly to rub her forehead, she struck it against the hat, and discovered what was doing; upon which she was thrown into violent convulsions, and was not without great difficulty recovered. The family were by these experiments, and by several accidental circumstances, fully convinced that she was totally deaf and blind; particularly by sitting unconcerned at her work, during a dreadful storm of thunder and lightning, though she was then facing the window, and always used to be much terrified in such circumstances. But Sir Hans Sloane, her physician, being still doubtful of the truth of facts, which were scarce less than miraculous, he was permitted to satisfy himself by such experiments and observations as he thought proper; the issue of which was, that he pronounced her to be absolutely deaf and blind.

"She was at length sent to Bath, where she was in some measure relieved; her convulsions being less frequent, and her pains less acute: but she never recovered her speech, her sight, or her hearing in the least degree.

"Many of the letters dated at Bath, in some of which there are instances of interlineations with a caret, the writer of this narrative hath seen, and they are now in the custody of the widow of one of her brothers, who, with many other persons, can support the facts here related, however wonderful, with such evidence as it would not only be injustice, but folly, to disbelieve."

An account of a French lady, blind from her infancy, who can read, write, and play at cards, &c.— "A young gentlewoman of a good family in France, now in her 18th year †, lost her sight when only two years old, her mother having been advised to lay some pigeons blood on her eyes, to preserve them in the small-pox; whereas, so far from answering the end, it eat into them. Nature, however, may be said to have compensated for the unhappy mistake, by beauty of person, sweetness of temper, vivacity of genius, quickness of conception, and many talents which certainly much alleviate her misfortune.

"She plays at cards with the same readiness as others of the party. She first prepares the packs allotted to her, by pricking them in several parts; yet so imper-

ceptibly, that the closest inspection can scarce discern her indexes. She sorts the suits, and arranges the cards in their proper sequence, with the same precision, and nearly the same facility, as they who have their sight. All she requires of those who ply with her, is to name every card as it is played; and she retains so exactly, that she frequently performs some notable strokes, such as show a great combination and strong memory.

"The most wonderful circumstance is, that she should have learned to read and write; but even this is readily believed on knowing her method. In writing to her, no ink is used, but the letters are pricked down on the paper; and by the delicacy of her touch, feeling each letter she follows them successively, and reads every word with her finger ends. She herself in writing makes use of a pencil, as she could not know when her pen was dry; her guide on the paper is a small thin ruler and of the breadth of her writing. On finishing a letter, she wets it, so as to fix the traces of her pencil, that they are not obscured or effaced; then proceeds to fold and seal it, and write the direction: all by her own address, and without the assistance of any other person. Her writing is very straight, well cut, and the spelling no less correct. To reach this singular mechanism, the indefatigable cares of her affectionate mother were long employed, who accustomed her daughter to feel letters cut in cards or pale-board, brought her to distinguish an A from a B, and thus the whole alphabet, and afterwards to spell words; then, by the remembrance of the shape of the letters, to delineate them on paper; and, lastly, to arrange them so as to form words and sentences.

"She has learned to play on the guitar, and has even contrived a way of pricking down the tunes as an assistance to her memory. So delicate are her organs, that in singing a tune, though new to her, she is able to name the notes.

"In figured dances she acquits herself extremely well, and in a minuet with inimitable ease and gracefulness. As for the works of her sex, she has a masterly hand; she sews and hems perfectly well; and in all her works she threads the needles for herself however small.

"By the watch her touch never fails telling her exactly the hour and minute."

From this account, however, it would appear, that except reading and writing, the French lady has nothing to boast of in which she is not excelled by Mr Stanley already mentioned, if we may credit all that is reported of him. The works peculiar to her sex are gained mechanically; but the *distinguishing colours*, telling the precise time by a watch, naming the notes in music, and many other things depending upon the ear and touch, are said to be so familiar to him, that his friends cease to think them extraordinary. Attainments still more wonderful are ascribed to him; as, the naming the number of persons in a room on entering it; the directing his voice to each person in particular, even to strangers when they have once spoken; the missing any person absent, and telling who that person is; and, lastly, his being able to form just conceptions of youth, beauty, symmetry, and shape.

Blind
||
Blindness.

Pore-BlIND, or *Pur-blind*. A person who is very short sighted is said to be *pur-blind*.

Moon-BlIND, denotes horses that lose their sight at certain times of the moon. See FARRIERY.

BlIND-Harry. See HENRY the Minstrel.

BlIND-Worm. See ANGIUS.

BLINDE, among mineralists, a species of lead-ore, by our miners called mock-ore, mock-lead, and wild lead, &c. The German mineralists call it *blinde*, whence our denomination *blinde*. It answers to what in Agricola is called *Galena inanis*.

It usually lies immediately over the veins of lead-ore, in the mines which produce it, for it is not found in all. When the miners see this, they know the vein of ore is very near.

BLINDS, or BLINDES, in the art of war, a fort of defence commonly made of uziers, or branches interwoven, and laid across between two rows of stakes, about the height of a man, and four or five feet asunder, used particularly at the heads of trenches, when they are extended in front towards the glacis; serving to shelter the workmen, and prevent their being overlooked by the enemy.

BLINDING, a species of corporal punishment anciently inflicted on thieves, adulterers, perjurers, and others; and from which the ancient Christians were not exempt. Sometimes lime and vinegar, or barely scalding vinegar, was poured into the eyes till their balls were consumed; sometimes a rope was twined round the head till the eyes started out. In the middle age, they changed total blindness for a great darkness or diminution of sight; which they produced by holding a red-hot iron dish or basin before the eyes till their humours were dried and their coats shrivelled up.

The inhabitants of the city Apollonia executed it on their watch whom they found asleep.—Democritus (according to Plutarch, Cicero, and A. Gellius), put out his own eyes, that he might be less disturbed in his mental contemplations, when thus freed from the distraction of the objects of sight.

BLINDNESS, a privation of the sense of sight, arising from a total deprivation of its organs, or an involuntary obstruction of their functions. See the article BLIND.

Total BLINDNESS, is that wherein all sight or perception, even of light, is wanting, as is the case of those who are said to be *stone-blind*. A blind man, by the civil law, cannot make a testament except under certain modifications; but in every case he is disabled from being a witness to a testament, on account of his blindness.

Partial BLINDNESS, is that wherein some faint glimmering is left, as is always the case in people who have ripe cataracts, who are never so blind but they can discern day from night.

Perpetual BLINDNESS, is that which remains alike under all the diversity of seasons, times, ages, &c.

Transient BLINDNESS, is that which gives way of itself in due time, as that of whelps, which continues for several days, sometimes nine, rarely twelve, after they are littered. The Nogais Tartars, according to father Du Ban the Jesuit, who lived among them, are born blind, and open not their eyes till several days.

Periodical BLINDNESS, is that which comes and goes

by turns, according to the season of the moon, time of day, and the like.

Diurnal BLINDNESS, is called *hemeracopia*.

Nocturnal BLINDNESS, called also *nyctalopia*, that which ensues on the setting of the sun in persons who see perfectly in the day, but become quite blind as soon as night comes on. Brigg, in Phil. Trans. N^o 159. p. 560, where an instance of it is given. See a singular case of this kind related by Dr Samuel Pye, in the Medic. Observ. and Inquir. Vol. I. p. 111.

The causes of blindness are either ordinary, as a decay of the optic nerve (an instance whereof we have in the Academy of Sciences, where upon opening the eye of a person long blind, the optic nerve was found extremely shrunk and decayed, and having no medulla in it); or some external violence, vicious confirmation, growth of a cataract, *gutta serena*, small-pox, or the like. See MEDICINE-Index.

Extraordinary causes of blindness are malignant stench, poisonous juices dropped into the eye, baneful vermin, long confinement in the dark, or the like. The ducks which breed under ground, and break out into the Zirchnitzer sea in Carniola after all great storms, are blind at their first eruption; but in some time come to their sight. The author of the Embassy of D. Garcias de Sylva Figueroa into Persia tells us, that in several parts of that kingdom are found vast numbers of blind people of all ages, sexes, and conditions; by reason of a species of little flies which prick the eyes and lips, and enter the nostrils, carrying certain blindness with them when they light on the eyes.

BLINDNESS, in farriery, is a disease incident to horses, especially those of an iron-grey or dapple-grey colour, when ridden too hard or backed too young. It may be discovered by the walk or step, which in a blind horse is always uncertain and unequal, because he dares not set down his feet boldly when led in one's hand; though if the same horse be mounted by an expert horseman, and the horse of himself be mettled, the fear of the spur will make him go more freely; so that his blindness can hardly be perceived. Another mark whereby a horse may be known to have lost his sight is, that upon hearing any body enter the stable, he will prick up his ears, and move them backwards and forwards, as mistrusting every thing, and being in continual alarm by the least noise. Dr Lower first showed the cause of the ordinary blindness in horses, which is a spongy excrecence, growing in one, sometimes in two, or three places of the *uvea*, which being at length overgrown, covers the pupil when the horse is brought into the light, though in a dark stable it dilates again.

BLINKS, among ancient sportsmen, denoted boughs broken down from trees, and thrown in the way where deer are likely to pass, to hinder their running, or rather to mark which way a deer runs, in order to guide the hunter.

BLINKING OF BEER, in Lincolnshire, signifies letting the wort stand for some time in the vat, till it hath acquired some degree of acidity, in order to dispose it to fine, and be the sooner ready for drinking.

BLISSOM, among husbandmen, corruptly called *Blissom*, is the act of a ram when coupling with an ewe.

BLISTER, in medicine, a thin bladder containing a watery humour, whether occasioned by burns and the like accidents, or by vesicatories applied to different parts of the body for that purpose*.—Cantharides, or Spanish flies, applied in the form of a plaster, are chiefly used with this intention. See **CANTHARIDES**.

BLITE, in botany. See **BLITUM**.

BLITH, a town of Nottinghamshire, in England, seated in W. Long. 0. 55. N. Lat. 53. 25.

BLITUM, **BLITE**, or *Strawberry Spinach*: A genus of the digynia order, belonging to the monandria class of plants; and in the natural method ranking in the 12th order, *Holeraceæ*. The calyx is trifid; no petals; the seed is one, included in a berry-shaped calyx.

Species. 1. The capitatum, with flowers in clustered heads at the joints and crown of the stalks, is a native of Spain and Portugal, but has been long preserved in the British gardens on account of the beauty of its fruit. It is an annual plant, with leaves somewhat like those of spinach; the stalk rises two feet and an half high; the upper part of the stalk hath flowers coming out in small heads at every joint, and is terminated by a little cluster of the same: after the flowers are past, the heads swell to the size of wood strawberries, and when ripe have the same appearance, but are not eatable; they are full of a purple juice, which stains the hands of those who bruise them of a deep purple colour. 2. The virgatum, with small heads growing from the sides of the stalks, is a native of the south of France and Italy. This seldom grows more than a foot high: the leaves are smaller than the first, but of the same shape: the flowers are produced at the wings of the leaves, almost the length of the stalk; they are smaller, and not so deeply coloured as the first. 3. The tartaricum, triangular, acutely indented leaves, is a native of the country from which it takes its name. Mr Müller received the seeds from Peterburg. It rises to very near three feet high; the flowers come out from the sides of the stalks, but are smaller than those of the first, as is also the fruit.

Culture. All these plants, being annuals, must be propagated by seeds; and as they are very hardy, will succeed in the common borders. If sown in March or April, covering the seed about half an inch deep with earth, and leaving the plants five or six inches asunder. When they come up, each must be supported with a small stick, or they will be borne down by the weight of the berries.

BLOATING, a puffing up or inflation of the exterior habit of the body, lodged chiefly in the adipose cells. It is the same with what physicians call an *empysemata*.

BLOCK is used for a piece of marble as it comes out of the quarry, before it has assumed any form from the hand of a workman.

Block, in the mechanic arts, a large piece of solid wood whereon to fasten work or to fashion it; strength and stability being the requisite properties. In this sense, we say a *chopping block*; a *sugar-sifter's block*; a *smith's block*, on which his anvil is fastened; an *executioner's block*, on which the criminal's head is laid to be struck off.

Block, among cutters in wood, is a form made of pear-tree, box, or other hard and close-grained wood, free from knots, on which they cut their figures in relief with knives, chisels, &c.

Block, in falcoary, denotes the perch whereon a bird of prey is kept. This is to be covered with cloth.

Blocks, in sea-language, are pieces of wood belonging to ships, in which the shivers of pulleys are placed, and wherein the running-ropes go. Of these some are single, some double; and some have three, four, or five, shivers in them. They are named and distinguished by the ropes they carry, and the uses they serve for.

Mounting Block, an eminence usually of stone, cut in steps or notches, serving as a help to mount on horseback. These were much in use among the ancients, who were unacquainted with stirrups. The Romans erected them at proper stations along all their great roads.

Block (Daniel) portrait painter, was born at Stettin in Pomerania in 1580, and gave early proofs of a good genius; which induced his parents to place him as a disciple with Jacob Scherer, a master capable of giving him the best directions, to qualify him for proceeding successfully in his profession. He chiefly painted portraits, in which (according to Sandrart) he was very eminent, and had the honour to paint the portraits of Christian IV. King of Denmark, and of Gustavus Adolphus King of Sweden. The extraordinary merit of this master recommended him to the esteem of the Prince of Mecklenburg, who retained him in his service for 44 years; and by order of that Prince, he painted the portraits of his whole family at full length, as large as life, and in the antique habit; by which works his reputation was established effectually. By the agreeable manner of his colouring, and the easy attitudes of his figures, his paintings became so acceptable to all persons of rank, that before the decline of life, he had acquired a very large fortune; but unfortunately he lost it all, in the compass of a few hours, by the sudden eruption of a plundering party, and with great difficulty his own life was preserved. He died in 1661.

BLOCKADE, in the art of war, the blocking up a place, by posting troops at all the avenues leading to it, to keep supplies of men and provisions from getting into it; and by these means proposing to starve it out, without making any regular attacks.

To raise a blockade, is to force the troops that keep the place blocked up from their posts.

BLOCKLAND (Anthony de Montfort), history and portrait painter, was born of a noble family at Montfort in 1532. He learned the art of painting in the school of Francis Floris, whose manner he always followed; and became an artist of great distinction, by endeavouring principally to imitate the taste of the Roman school in design and composition. His genius was best adapted to grand compositions, of which he designed many; some at Delft, but more at Utrecht. His designs had grandeur, the airs of his heads were noble, and the profiles of his female figures approached near to the taste of Parrigiano. Several of his works are in so good a gullo, and particularly a Venus, and

Bloccil
||
Bloemart.

the history of Joseph and his Brethren, that they seem to have been painted by a master educated in the school of Florence. He died in 1583.

BLOCCIL, a fortress of Over-yffel in the United Provinces, seated on the river Aa, at the place where it falls into the Zuider Zee. It has a port sufficient to contain 200 vessels, and serves to defend those ships that cross the sea. It has six good bastions, and several other regular fortifications. E. Long. 6. o. N. Lat. 52. 44.

BLOEMART (Abraham), painter of landscape, cattle, history, and portrait, was born at Gorcum in 1564, according to Houbraken; but according to Sandrart, whose authority seems to claim the preference, he was born in 1567, and lived mostly at Utrecht. In his youth he applied himself diligently to design after the works of Francis Floris, and afterwards received instructions from several artists of no great repute; but the power of his own genius proved his principal director in the art of painting. He formed a manner peculiar to himself, making nature his model for many of the objects he painted, particularly his cattle, in which he excelled. He died in 1647. He left four sons who were all of them artists; but the most famous was *Cornelius*, the subject of the following article.

BLOEMART (Cornelius), the youngest son of Abraham, was born in 1603 at Utrecht. The first principles of drawing and painting he learned from his father; but his natural inclination for the art of engraving was so powerful, that he applied himself wholly to the pursuit of it. He first studied under Crispin de Pass, an engraver much more famous for the neatness than the good taste of his works. Not satisfied with what he learned from this artist, he went to Rome, in order to perfect himself from the works of the greatest masters: And in that city (where the far greater part of his engravings were made) he died in a very advanced age.—“The manner of engraving, adopted by this excellent artist, appears to me (says Mr Strutt) to be not only quite original, but the source from which we may trace that style in which the greatest and best French masters excelled; those I mean who worked with the graver only. He covered the lights upon his distances, and the other parts of his plates which required tinting, with great care. The lights, whether on the distant hills, trees, buildings, or figures, in the engravings prior to his time, had been left quite clear, and by so many white spots scattered in various parts of the same design, the harmony was destroyed, the subject confused, and the principal figures prevented from relieving with any striking effect. By this judicious improvement, Bloemart gave to his prints a more clear and finished appearance, than all the laboured neatness even of Jerom Wierix had been able to produce. He drew correctly; but from his style of engraving, which was executed entirely with the graver, the extremities of his figures are heavy, and his heads are not always equally beautiful or expressive. With respect to the mechanical part of the works, few indeed have excelled him, either in clearness or freedom of execution. His great fault, however, is want of variety. The naked parts of his figures, the draperies, and the back-ground, are equally neat, and engraved precisely in the same manner. Hence the effect is flat; and the flesh, for want of sufficient distinction, appears

cold and silvery. His works are justly held in high estimation. They are very numerous, and many of them difficult to be procured.”

BLOIS, a town of France, the capital of Blaifois, in Orleansois, is seated on the banks of the river Loire, partly on a plain, and partly on an eminence, in the midst of one of the most agreeable countries of France. The castle is the ornament of this city. At the first view, it seems to be two distinct buildings; but it is joined by a passage cut out of the rock. Joining to this, on the west-side, is the tower of *Chateau Renaud*, so called because that lordship may be discovered from hence, though 20 miles distant. At the east-end of this is another small tower, which is partly ancient and partly modern. That part of the castle which was built by the Duke of Orleans, in the room of that which he demolished in 1632, is a superb edifice, but unfinished. The court, before it, where the church of St Saviour is built, is very large, and was formerly used for tournaments. The most remarkable thing in this castle is a fine long gallery, adorned with many curious and uncommon pieces; it is in the midst of two gardens, one of which is full of fruit-trees, and the other of parterres, fountains, cascades, and marble statues brought from Italy. Beyond these, there is a large park, where there is game in abundance. On all the gates of the city there is the image of the Virgin Mary, who they believe freed them from the plague in 1631. There are several parish-churches, chapters, and religious houses for both sexes. The church of St Solenne is the cathedral, and is the handsomest in the city. The front of the Jesuits church is decorated with three orders of architecture, the Doric, Ionic, and Corinthian; but there is only the Doric on the inside. The town-house is a tolerable building, and stands in a street which terminates at the quay, where there is a public walk that has a fine prospect on the Loire, over which there is a bridge that leads to the suburbs of Vienna. There are a few houses on the bridge, and a tower at each end to guard the entrance. About three quarters of a mile from the city, the water runs down the clefts of a rock into a large aqueduct, by which it is conveyed to a reservoir near the walls, and from hence distributed by leaden pipes to the several parts of the city. The country about Blois produces corn, wine, cattle, and game of every kind, and the waters a great quantity of fish. The meadows are so rich and fertile, that the cows yield excellent milk, good in consumptive cases, and which affords the best cream in the kingdom. About a league from Blois, there are mineral springs, which have the same virtues as those of Forges. The trade of Blois is chiefly in wine and brandy; but they also make some ferges and stuffs at this place. Several kings have kept their courts at Blois; for which reason they speak the French language in perfection, and the inhabitants are accounted witty and polite. E. Long. 1. 30. N. Lat. 47. 31.

BLOMARY, or BLOOMARY, in metallurgy, the first forge through which iron passes, after it is melted out of the ore.

BLOEMEN (Peter Van), a celebrated painter, born at Antwerp, was brother to John-Francis Van Bloemen, called by the Italians *ORIZONTI*, and lived for several years at Rome along with his brother. As soon

Blois
||
Bloemart.

men, soon as he found himself competently skilled in colouring and penciling, as well as in designing, he returned to his native city, where, in the year 1699, he was appointed director of the academy. The composition of this master is rich, and his pictures are generally filled with a number of figures. His subjects are, the marchings of squadrons of cavalry, encampments, artillery, battles, Italian fairs, markets, and festivals; in which he showed great correctness in his design and in his drawing; and an elegance in the manner of dressing his figures; whom he frequently represented in oriental habits. He designed horses in an admirable style; and in his battles gave them abundance of spirit, graceful attitudes, and an expression that was full of life and nature. His landscapes are enriched with elegant architecture, with basso-relievos, and mutilated statues, in a noble taste; and rendered still more pleasing by a good tone of colour, by animals of different kinds, and excellent figures.—His best works are admired in all parts of Europe, and afford large prices: but it is to be observed, that some of his pictures seem rather to be too much laboured or stiff, and (according to the artists phrase) smell of the palette; and those are proportionably less estimable.

BLOEMEN (John Francis Van). Vid. **ORIZONTI**.

BLOEMEN (Norbert Van), brother of the preceding, was a painter of portraits and conversations; but in merit was very inferior to his brothers, although he had a good deal of employment.

BLOND (Christopher le), painter of portraits in miniature and all kinds of subjects on paper, was born in 1670. Very few circumstances relative to his education or life are mentioned by any writers till he was known at Rome in the year 1716, being at that time painter to the Count Martinetz, ambassador at the court of Rome. By the solicitation of Overbeke he was induced to go to Amsterdam, and in that city was employed to paint small portraits for bracelets, rings, and snuff-boxes; of which, although they were painted in water-colours, yet the colouring was as lively and natural as if they had been painted in oil. However, as he found his sight much impaired by the minuteness of his work, he discontinued water-colour painting, and attempted the use of oil with a reasonable degree of success. After he had resided for some years in the Low Countries, he went to England, and set up a new method of printing mezzotinto plates in colours so as to imitate the pictures of which they were copies. In this manner he executed in England several large plates, from pictures of the greatest masters, and disposed of the prints by lottery. But those who obtained the prizes (Mr Strutt says) appear not to have held them in any very great estimation. "The prints (he adds) certainly possess some merit, exclusive of their novelty; but, in general, the colours are flat and dirty; the effect is neither striking nor judiciously managed; and the drawing is frequently very incorrect, especially in the extremities of his figures." Mr Pilkington speaks of them with greater approbation. "The artist (he says) imitated his models with so much skill, such exact resemblance, such correctness of outline, such similarity of colour and expression, that at first they amazed every beholder who viewed them at a proper distance; and many of those prints are still extant, which are much esteemed by persons of good

taste." And Mr Walpole observes, that some heads, coloured progressively, according to their several gradations, bear witness to the success and beauty of his invention. He had another merit to the public, with which few inventors begin; for he communicated his secret in a thin quarto, intitled *Colritti*, or "The harmony of colouring in painting reduced to mechanical practice, under easy precept and infallible rule." His method was performed by several mezzotinto plates for one piece, each expressing different shades and parts of the piece in different colours. He was not, however, it is said, the original inventor of that manner of managing colours, but took it from Lehmman and others, who, with much greater regularity of morals, equal capacities, and more direct conduct, had before undertaken it without success. Le Blond, whose head was continually full of schemes, next set on foot a project for copying the cartoons of Raphael in tapestry, and made drawings from the pictures for that purpose. Houses were built and booms erected at the Mulberry Ground at Chelsea; but the expences being too great, or the contributions not equal to the first expectations, the scheme was suddenly defeated, and Le Blond disappeared, to the no small dissatisfaction of those who were engaged with him. From hence he went to Paris, where, Basan informs us, he was in the year 1737; and in that city he died, 1740, in an hospital. Le Blond was also author of a treatise, in French, on ideal beauty. It was published in 1732, and has since been translated into English.

BLONDEL (David), a protestant minister, distinguished by his skill in ecclesiastical and civil history, was born at Chalons sur Marne, and was admitted minister at a synod of the isle of France, in 1614. He wrote, 1. A defence of the reformed churches of France. 2. A work against the decretal epistles. 3. *De Episcopis et Presbyteris*; and other pieces. Bayle informs us that he had a very singular way of studying; he lay on the ground, and had round about him the books which he wanted for the work he was about. He died in 1655, aged 64.

BLONDÉL (Francis), regius professor of mathematics and architecture, was employed in several negotiations, arrived at the dignity of marshal de camp and counsellor of state, and had the honour of being chosen to teach the dauphin the mathematics; he was also made member of the Academy of Sciences at Paris, and director of the Academy of Architecture. He died at Paris in 1688, aged 68. He wrote, 1. Notes on the architecture of Savot. 2. A course of architecture and mathematics. 3. The art of throwing bombs. 4. A new manner of fortifying places. 5. A comparison between Pindar and Horace; and other works.

BLONDUS (Flavius), an historian born at Forli, in Italy, in 1388, was secretary to Eugenius IV. and other popes. He composed a great many books; and, among others, a History from the year 400 to 1440. He died in 1463.

BLONIEZ, a town of Poland, in the province of Warsawia. E. Long. 20. 35. N. Lat. 52. 0.

BLOOD, a red liquor circulating through the vessels of the human body and the bodies of the larger animals, which appears immediately and essentially necessary to the preservation of life.

Though there is no living creature as yet known
which

Blend
Blood.

Blood.
1
No animal without some liquid equivalent to blood.

2
Blood of different thickness in different animals.

3
That of bulls and is used as a poison.

4
Appearance of the blood when drawn from a vein.

5
Blood chemically analysed.

6
Contains an acid, according to some chemists.

7
Experiment in confirmation of this.

whose life doth not immediately depend upon the circulation of some kind of fluid through its vessels, yet unless such fluid is of a red colour, it does not obtain the name of *blood*; and therefore such creatures as have a colourless or milky liquor circulating through their vessels, are called *exsanguous animals*.

The blood has a very different degree of thickness or viscosity in different animals, and even in the same animal at different times. Though it is in all cases endowed with a considerable degree of tenacity, yet in strong animals that tenacity is remarkably greater than in weak ones; and hence the blood of bulls was made use of by the ancients as a poison, its extreme viscosity rendering it totally indigestible by the powers of the human stomach. It is well known also by physicians, that there are some states of the human body in which the blood becomes vastly tenacious, so as in a great measure to refuse any intimate connection with water; and others, in which its crasis is almost totally dissolved, so as to appear, when drawn out of the body, like a fluid and half putrid mass. See *MEDICINE-Index*.

The common appearance of the blood when drawn from a vein in the human body is well known. It first seems an homogeneous red liquor; then it consolidates into one uniform mass; in a little time, a yellowish watery liquor begins to separate from it, which is more or less in quantity according to the state in which the blood happens to be; the red mass, in the mean time, contracts greatly in its dimensions, and increases in solidity. But this increase of solidity is likewise proportional to the state of the blood at the time: in strong people, if attacked with a violent inflammatory disease, the solid part is exceedingly tough, insomuch that Dr Huxham says he has sometimes found it almost like a piece of flesh itself; whereas, in other diseases, the solid part is very soft and tender, breaking in pieces with the slightest touch. The spontaneous separation of the blood into crassamentum, serum, and coagulable lymph, hath been already taken notice of under *ANATOMY*, n^o 126.

The attention of physiologists hath been very much engaged by inquiries into the nature and composition of the blood, and accordingly it hath been examined in all possible ways. By a chemical analysis, it discovers the same principles with other animal substances; giving over in distillation a great quantity of phlegm, a volatile spirit, with much fetid oil; after which, there remains a charred matter, that, burnt in an open fire, leaves a white earth similar to calcined hartshorn. Some eminent chemists, Mr Homberg particularly, have asserted that blood contains an acid as well as an alkali, but that the former doth not arise till towards the end of the distillation: but what is very singular, and indeed must throw no small suspicion on the whole account, is, that the acid and alkali, notwithstanding their great tendency on all other occasions to unite with each other, do here remain separate, so that the liquor may be even redistilled without their forming any neutral compound. An experiment in confirmation of this is recorded in the memoirs of the Royal Academy for 1712. Six pounds of human blood distilled to dryness with a gentle heat, were reduced to a pound and an half; after which, the mass was urged with a graduated fire, till the retort at last became red hot. The produce was 17 ounces of liquor; 12 of which were a red and very empyreuma-

tic volatile spirit, the other five were oil. The caput mortuum was a light coal weighing four ounces and a half. On rectifying the volatile spirit in a small retort, about an ounce of a red fetid liquor remained, which had a very acid smell, and turned the juice of turnsole red. Mr Homberg now imagined, that the acid contained in the blood of animals could not disengage itself perfectly by these distillations without addition. He therefore determined to distil human blood with an admixture of some other substance; but as earths contain a salt, which might render the operation uncertain, he determined to use only the caput mortuum of a former distillation of the same substance. For this purpose, four pounds of the coagulum of human blood being well mixed with a large quantity of this residuum, and the whole dried in the sun, it was put into a retort, and distilled with a fire raised, towards the end of the operation, to the utmost violence. The oil being separated from the volatile spirit, the latter was rectified; and the consequence was, that there came over four pounds of a red acid liquor, that turned the tincture of turnsole very red. All the distillations of the aqueous liquors already mentioned, obtained by similar processes, being mixed together, and separated from their yet remaining oil, by careful dilution with water and filtration, they were at length distilled together; the liquor that came over was clear as water, and its first quantities contained a great deal of volatile salt, but the last two ounces were found to be as four as distilled vinegar.—The same products were obtained from the blood of carnivorous animals, as well as from that of animals feeding solely upon vegetables.

In Dr Lewis's notes on Newman's Chemistry we have the following account of the blood, and the parts into which it may be resolved. "Recent blood is equally fluid, and in taste somewhat saline. Viewed by a microscope, it appears composed of numerous red globules swimming in a transparent fluid. On standing for a little time, it separates into a thick crassamentum and fluid serum. By agitation, it continues fluid: A consistent polypous matter adheres to the sliner, which, by repeated abluion with water, becomes white.—Received from the vein in warm water, it deposits a quantity of transparent filamentous matter, the red portion continuing dissolved in the water. On evaporating the fluid, a red powdery substance is left.—It congeals by frost, and becomes fluid again by warmth; after liquefaction, it quickly putrefies.—Fluid and florid blood exposed to a temperate air, putrefies sooner than such as is more dense. Inspissated to dryness, it leaves a dark-coloured mass, amounting, at a medium, to about one-fourth of the weight of the blood, of a bitter saline taste, easily inflammable, burning with a bluish flame. The calcified blood is not soluble in acid or alkaline liquors; but gives some tincture to water and to spirit of wine, and is more powerfully acted upon by dulcified spirit of nitre. Recent blood is coagulated by the mineral acids, and by most of the combinations of them with earthy and metallic bodies. With vegetable acids, and with solutions of neutral salts, it mingles equably without coagulation. Alkalis, both fixed and volatile, render it more fluid, and preserve it from coagulating.

"The serum of blood is more saline than the crassamentum,

d. famentum, and does not so speedily putrefy. It freezes somewhat more difficultly than pure water; and its aqueous part evaporates, by a gentle warmth, somewhat more readily, leaving about one-twelfth of the weight of the serum of a solid yellowish pellucid matter. Expesed to heat a little greater than that of the human body, it coagulates into a solid mass, without any considerable evaporation. Both this coagulam and the inspissated serum are readily inflammable in the fire, not dissoluble in water, or in spirit of wine, in acid or in alkaline liquors."

But the texture of the blood discoverable by a microscope, hath engaged the attention of the learned much more than the chemical analysis ever did. Lewenhoeck was the first who discovered, or fancied he discovered, that the blood, as it exills in the body of an animal, consists of a quantity of red globular particles swimming in a large quantity of transparent liquor. Each of these globules, he imagined, was composed of six smaller ones packed together. While the six continued to adhere, their colour was red; but when separated, they became yellow, and thus formed what is called the *serum*. He even pretended to have discovered that each of the ferous globules consisted of six smaller ones, and that these when broken down constituted some more subtil and penetrating liquor than the serum, &c. This was for a long time received almost universally as an undoubted fact; and many theories were built upon it, and elaborate calculations made, of which (we hope) no account needs now be given, as the falsity of these pretended discoveries is generally allowed. Father de Torre, with microscopes which he pretended were capable of magnifying to an incredible degree, found that the red particles of the blood were of an annular figure, with a perforation in the middle; and that the ring itself was formed of several joints. Some of these extraordinary magnifiers, however, being sent over to England, those who were appointed by the Royal Society to make trial of them found them totally usefess, so that the credit of Father de Torre's discoveries must have rested principally on his own evidence. The falsity of his hypothesis, as well as that of Lewenhoeck, was detected by the late Mr Hewson, whose microscopical experiments on the blood being the latest that have appeared, we shall transcribe the following particular account of them given by himself in a letter to Dr Haygarth physician in Chelster. — "The red particles of the blood, improperly called *globules*, are flat in all animals, and of very different sizes in different animals. In man they are small, as flat as a shilling, and appear to have a dark spot in the middle. In order to see them distinctly, I dilute the blood with fresh serum. My predecessors, not having thought of this, could not see them distinctly. And Lewenhoeck in particular, imagining a round figure fittest for motion, concluded they must be round in the human body; though he and others allowed that in frogs, &c. where they viewed them distinctly from the blood being thinner, they were flat. Now I prove that they are flat in all animals. In the human blood, where these particles are small, it is difficult to determine what that black spot is which appears in the centre of each. Some have concluded that it was a perforation: but in a frog, where it is six times as large as in a man, it is easy to show that it

is not a perforation, but on the contrary is a little solid, which is contained in the middle of a vesicle. Instead, therefore, of calling this part of the blood red *globules*, I should call it red *vesicles*; for each particle is a flat vesicle, with a little solid sphere in its centre.

"I find that the blood of all animals contains vesicles of this sort. In human blood there are millions of them; and they give it the red colour. But in insects they are white, and less numerous in proportion than in man and quadrupeds. As they are flat in all animals, I suspect that shape is a circumstance of importance, but can be altered by a mixture with different fluids. And I find that it is by a determinate quantity of neutral salt contained in the serum, that this fluid is adapted to preserving these vesicles in their flat shape: for, if they be mixed with water, they become round, and dissolve perfectly; but add a little of any neutral salt to the water, and they remain in it, without any alteration in their shape, and without dissolving.

"Now, when it is considered, that the blood of all animals is filled with these particles, we must believe that they serve some very important purpose in the animal economy; and since they are so complicated in their structure, it is improbable they should be made by mechanical agitation in the lungs or blood-vessels, as has been suspected, but probably have some organs set apart for their formation. This I shall endeavour to prove, when I have explained their structure a little more particularly, and mentioned the manner in which I exhibit it. I take the blood of a toad or frog, in which they are very large; I mix it with the serum of human blood to dilute it; I find them appear all flat; so they do in the blood-vessels of this animal, as I have distinctly seen in the web between its toes, whilst the animal was alive and fixed in the microscope. Their appearance in these animals is not unlike slices of cucumber. I next mix a little of the blood with water, which immediately makes them all round, and then begins to dissolve them whilst they are round. I incline the stage of the microscope, so as to make them roll down it; and then I can distinctly see the solid in the middle fall from side to side like a pea in a bladder. A neutral salt added to them at this time brings them back to their flat shape: but if the salt be not added, the water gradually dissolves away the vesicle; and then the little sphere is left naked. Such is the composition of these particles. I have exhibited these experiments to a considerable number of my acquaintance, who all agree in their being satisfactory.

"The microscope I use is a single lens, and therefore as little likely to deceive us as a pair of spectacles, which, as is allowed by all who use them, do not distfigure objects, but only represent them larger.

"From farther experiments, I am convinced, that the use of the thymus and lymphatic glands is to make the middle solid pieces: and I can prove it in as satisfactory a manner as you can do the use of any viscus in the human body; that is, by opening these glands, and examining the fluid contained in their cells, which I find to be full of these little solids. I moreover find, that the lymphatic vessels take them up from these glands, and convey them into the blood-vessels which carry them to the spleen, in whose cells they have the vesicles

Blood. vesicles laid over them; so that the thymus and lymphatic glands make the central particles, and the spleen makes the vesicles that surround them. That this is the use of the spleen appears from examining the lymph which is returned from its lymphatic vessels; for that lymph, contrary to what is observed in other parts of the body, is extremely red.

“ But besides having these glands set apart for making the red vesicles of the blood, I find that they are also made in the lymphatic vessels in different parts of the body, whose coats have blood-vessels properly constructed for this secretion. So that the thymus and lymphatic glands are no more than appendages of the lymphatic system, for making the middle particles; and the spleen an appendage to the lymphatic vessels, for making the vesicles which contain these middle particles.

“ I conjecture that it is the coagulable lymph which is converted into this red part of the blood, from a curious fact that has long been known; namely, that the blood in the splenic vein does not coagulate when exposed to the air, as the blood of other veins does; so that it seems to be robbed of its coagulable lymph in passing through the spleen.

“ It is very remarkable, that the spleen can be cut out of an animal, and the animal do well without it. I made the experiment on a dog, and kept him a year and a half without observing his health to be in the least impaired. From this some have concluded the spleen to be an useless weight; which is absurd, when we consider that all animals with red blood have it. Therefore it is more consistent with what we know of the animal economy, to conclude, that since an animal can do well without it, there is probably some part of the body that can supply its place.

“ Insects have vesicles constructed in a similar way to ours, but differing in colour. But insects have neither spleen, thymus, nor lymphatic glands; and therefore in them probably these vesicles are entirely fabricated in the lymphatic vessels. But to us, and other of the more perfect animals, besides the lymphatic vessels, nature has given those glands, that a proper quantity of those important vesicles might be the better secured to us; just as she has given us two ears, the better to secure us hearing through life, though we can hear perfectly well with one.”

This letter, we apprehend, contains the strength of Mr Hewson's evidence for his hypothesis; on which we shall only remark, that if the red globules are prepared in the manner above mentioned, and the lymphatic vessels are excretories of those glands where the red particles are formed; then if there is any vessel where all these excretories unite, as mentioned ANATOMY, n^o 106, in that vessel the lymph ought to appear very red, on account of the accumulated quantity of red globules brought thither from all parts of the body. But no such redness seems ever to have been taken notice of by any anatomist: this therefore must be an objection to Mr Hewson's hypothesis; and such an one, perhaps, as will not be easily removed.

Many other hypotheses have been invented concerning the formation of the red blood, and various opinions delivered concerning its red colour. In a lecture delivered at Newcastle in 1773, by Dr. Wilson of that

place, he asserts “ that it is self-evidently the office of the veins to elaborate the fluids into that form and composition which we know by the name of *red blood*.” The self-evidence here, however, is by no means apparent to us; nor doth he at all point it out in an intelligible manner.—Dr Cullen, in his physiological part of The Institutions of Medicine, acknowledges that we know but little of the formation of any of the animal fluids; and concerning the microscopical observations, &c. on the blood, gives his opinion in the following words, § ccliv. “ The red globules have been considered as an oily matter, and from thence their distinct and globular appearance has been accounted for: but there is no direct proof of their oily nature; and their ready union with, and diffusibility in, water, renders it very improbable. As being microscopical objects only, they have been represented by different persons very differently. Some have thought them spherical bodies, but divisible into six parts, each of which in their separate state were also spherical; but other persons have not observed them to be thus divisible. To many observers they have appeared as perfectly spherical; while others judge them to be oblate spheroids, or lenticular. To some they have appeared as annular, and to others as containing a hollow vesicle. All this, with several other circumstances relating to them, very variously represented, show some uncertainty in microscopical observations; and it leaves me, who am not conversant in such observations, altogether uncertain with respect to the precise nature of this part of the blood. The chemical history of it is equally precarious; and therefore what has been hitherto said of the production and changes happening to these red globules, we chuse to leave untouched.—We suppose that the red globules, when viewed singly, have very little colour; and that it is only when a certain number of them are laid upon one another, that the colour appears of a bright red: but this also hath its limits; so that when the number of globules laid on one another is considerable, the colour becomes of a darker red. Upon this supposition, the colour of the mass of blood will be brighter or darker as the colouring part is more or less diffused among the other parts of the mass; and we think this appears to be truly the case from every circumstance that attends the changes which have been at any time observed in the colour of the blood.”

Concerning the uncertainty of microscopical, as well as chemical experiments, we shall not dispute; though the conclusion against them seems carried too far. But with regard to the colour of the blood, we apprehend it hath been known, almost, if not altogether, since the discovery of the circulation, that the florid or dark colour depends on the presence or absence of air, and not upon any number of globules.—Thus the blood returning from the veins is of a dark colour. Though diluted with the fresh chyle from the subclavian vein, it continues of the same dark colour till it passes thro' the lungs, upon which it instantly assumes a very florid red; but it can never be proved that the globules in the pulmonary vein are at all less numerous than in the pulmonary artery.—That this change of colour may be effected by the air through membranes much thicker than we can suppose the vessels of the lungs to be, hath been demonstrated by Dr Priestley's experiments mentioned

Blood.

tioned under the article *DEPHLOGISTICATED Air*; but whether the change is occasioned by the mere separation of phlogiston from the blood, or by the absorption of some other principle in its stead, is not yet determined, though the latter is indeed acknowledged by Dr Priestley himself to be the more probable opinion. He even supposes the redness to be owing to a portion of dephlogisticated air absorbed in the lungs; but under the above article it is shown that this fluid cannot be absorbed by any liquid without decomposition. It must therefore be the elastic principle of this air which is absorbed, while the other combined with part of the phlogiston emitted by the blood is converted into fixed air.

17. Uses of the blood in animals.

This leads us to consider the uses to which the blood is subservient in the animal œconomy, and the changes that happen to it in respiration. The uses of this fluid are so various, and of such an important nature, that some have not scrupled to affirm the blood to be actually possessed of a living principle, and that the life of the whole body is derived from it. This opinion was first broached by the celebrated Harvey, the discoverer of the circulation: but in this he was never much followed; and the hypothesis itself, indeed, has been pretty much laid aside and neglected, till of late that it was revived by Mr J. Hunter, professor of anatomy in London. This gentleman supports his opinion by the following arguments: 1. The blood unites living parts, in some circumstances, as certainly as the yet recent juices of the branch of one tree unite it with that of another. Were either of these fluids to be considered as extraneous or dead matters, he thinks they would act as stimuli, and no union would take place in the animal or vegetable kingdom. This argument, Mr Hunter imagines, is still farther established by the following experiment. Having taken off the testicle from a living cock, he introduced it into the belly of a living hen. Many weeks afterwards, upon injecting the liver of the hen, he injected the testicle of the cock; which had come in contact with the liver, and adhered to it. He alleges, that in the nature of things, there is not a more intimate connection between life and a solid, than between life and a fluid. For, although we are more accustomed to connect it with the one than the other, yet the only real difference which can be shown between a solid and a fluid is, that the particles of the one are less moveable among themselves than those of the other. Besides, we often see the same body fluid in one case and solid in another. 2. The blood becomes vascular like other living parts. Mr Hunter affirms, that, after amputations, the coagula in the extremities of arteries may be injected by injecting these arteries; and he has a preparation in which he thinks he can demonstrate vessels rising from the centre of what had been a coagulum of blood, and opening into the stream of the circulating blood. 3. Blood taken from the arm in the most intense cold which the human body can bear, raises the thermometer to the same height as blood taken in the most sultry heat. This he considers as a strong proof of the blood's being alive; as living bodies alone have the power of resisting great degrees both of heat and cold, and of maintaining in almost every situation, while in health, that temperature which we distinguish by the name of *animal heat*.

18. The vital principle brought by me to reside in the blood.

19. Mr Hunter's arguments in favour of his opinion.

4. Blood is capable of being acted upon by a stimulus. In proof of this, he observes, that it coagulates from ex-

posure, as certainly as the cavities of the abdomen and thorax inflame from the same cause. The more it is alive, that is, the more the animal is in health, it coagulates the sooner on exposure; and the more it has lost of its living principle, as in the case of violent inflammation, the less is it sensible to the fire thus produced from its being exposed, and it coagulates the later. 5. The blood preserves life in different parts of the body. When the nerves going to a part are tied or cut, the part becomes paralytic, and loses all power of motion; but it does not mortify. If the artery be cut, the part dies, and mortification ensues. What keeps it alive in the first case? Mr Hunter believes it is the living principle which alone can keep it alive; and he thinks that this phenomenon is inexplicable on any other supposition, than that life is supported by the blood. 6. Another argument he draws from a case of a fractured os humeri he had occasion to observe. A man was brought into St George's hospital for a simple fracture of the os humeri, and died about a month after the accident. As the bones had not united, Mr Hunter injected the arm after death. He found that the cavity between the extremities of the bones was filled up with blood which had coagulated. This blood was become vascular. In some places it was very much so. He does not maintain that all coagulated blood becomes vascular: and indeed the reason is obvious; for it is often thrown out and coagulated in parts where its becoming vascular could answer no end in the system, as, for example, in the cavities of aneurismal sacs. If it be supposed, that, in such cases as that just now mentioned, the vessels are not formed in the coagulum, but come from the neighbouring arteries, he thinks it equally an argument that the blood is alive; for the substance into which vessels shoot must be so. The very idea, that such a quantity of dead matter as the whole mass of blood, circulates in a living body, appears to him absurd.

The system which at present stands opposed to that of Mr Hunter, considers the brain and nervous system as the fountain of life; and that, so far from receiving its life from the blood, the nervous system is capable of instantaneously changing the crasis of the blood, or any other animal fluid; and though the nervous system cannot continue its actions for any length of time if the action of the blood-vessels is suspended, yet the heart and blood-vessels cannot act for a single moment without the influence of the nervous fluid. Hence, say they, it is plain we must suppose the nervous system, and not the blood, to contain properly the life of the animal, and consequently to be the principal vital organ. The secretion of the vital fluid from the blood by means of the brain, is, by the supporters of this hypothesis, denied. They say, that any fluid secreted from the blood must be aqueous, inelastic, and inactive; whereas the nervous fluid is full of vigour, elastic, and volatile in the highest degree. The great necessity for the circulation of the blood through all parts of the body, notwithstanding the presence of the nervous fluid in the same part, they say is, because some degree of tension is necessary to be given to the fibres, in order to fit them for the influx of the nervous fluid; and this tension they receive from the repletion of the blood-vessels, which are every where dispersed along with the nerves.

To follow this dispute through every argument that hath been, or that may be, used by both parties, would

^{21.} ^{Decisive arguments in favour of M. Hunter's opinion.} prove tedious, and to us appears in a great measure unnecessary, as the following short considerations seem to decide the matter absolutely against the patrons of the nervous system. In the first place, then, if we can prove the life of the human body to have existed in, or to have been communicated from a fluid to the nervous system, the analogical argument will be very strongly in favour of the supposition that the case is so still. Now, that the case once was so, is most evident; for the human body, as well as the body of every other living creature, in its first state, is well known to be a gelatinous mass, without muscles, nerves, or blood-vessels. Nevertheless, this gelatinous matter, even at that time, contained the nervous fluid. Of this there can be no doubt, because the nerves were formed out of it, and had their power originally from it; and what is remarkable, the brain is observed to be that part of the animal which is first formed. Of this gelatinous fluid we can give no other account, than that it was the nutritious matter from which the whole body appears to be formed. At the original formation of man, and other animals, therefore, the nutritious matter was the substratum of the whole body, consisting of muscles, nerves, blood-vessels, &c. nay more, it was the immediate efficient cause of the nervous power itself. Why should it not be so now as well as then? Again, in the formation of the embryo, we see a vital principle existing as it were at large, and forming to itself a kind of regulator to its own motions, or a habitation in which it chooses to reside, rather than to act at random in the fluid. This habitation, or regulator, was undoubtedly the nervous system, and continues so to this moment; but at the same time, it is no less evident that a nutritious fluid was the immediate origin of these same nerves, and of that very nervous fluid. Now we know, that the fluid which in the womb nourishes the bodies of all embryo animals, is necessarily equivalent to the blood which nourishes the bodies of adult ones; and consequently, as soon as the blood became the only nutritious juice of the body, at that same time the vital or nervous fluid took up its residence there, and from the blood diffused itself along the nerves, where it was regulated exactly according to the model originally formed in the embryo. Perhaps it may be said, that the vital power, when once it hath taken possession of the human or any other body, requires no addition or supply, but continues there in the same quantity from first to last. If we suppose the nervous power to be immaterial, this will indeed be the case, and there is an end of reasoning upon the subject; but if we call this power a volatile and elastic fluid, it is plain that there will be more occasion for recruits to such a power than to any other fluid of the body, as its volatility and elasticity will promote its escape in great quantities through every part of the body. It may also be objected, that it is absurd to suppose any fluid, or mechanical cause, capable of putting matter in such a form as to direct its own motions in a particular way: but even of this we have a positive proof in the case of the electric fluid. For if any quantity of this matter has a tendency to go from one place to another where it meets with difficulty, thro' the air for instance, it will throw small conducting substances before it, in order to facilitate its progress. Also, if a number of small and light conducting substances are laid between two metallic bo-

dies, so as to form a circle, for example; a shock of electricity will destroy that circle, and place the small conducting substances nearer to a straight line between the two metals, as if the fluid knew there was a shorter passage, and resolved to take that, if it should have objection to return*. Lastly, it is universally allowed, that the brain is a secretory organ, made up of an infinite number of small glands, which have no other excretories than the medullary fibres and nerves. As a considerable quantity of blood is carried to the brain, and the minute arteries end in these small glands, it follows, that the fluid, whatever it is, must come from the blood. Now, there is no gland whatever, in the human, or any other body, but will discharge the fluid it is appointed to secrete, in very considerable quantity, if its excretory is cut. Upon the cutting of a nerve, therefore, the fluid secreted by the brain ought to be discharged; but no such discharge is visible. A small quantity of glairy matter is indeed discharged from the large nerves; but this can be no other than the nutritious juice necessary for their support. This makes it plain, even to demonstration, that the fluid secreted in the brain is invisible in its nature; and as we know the nervous fluid hath its residence in the brain, it is very probable, to use no stronger expression, that it is the peculiar province of the brain to secrete this fluid from the blood, and consequently that the blood originally contains the vital principle.

After it is allowed that the blood contains the vital principle, it becomes another question not very easily solved, Whence is this vital principle derived?—For this we can only discover two sources; namely, the chyle or aliment from which the blood is prepared, and respiration. The latter hath been commonly held as the principal source of the vital principle; and, for a long time, it was generally thought that there was a kind of vivifying spirit in the air, which being absorbed by the blood at each inspiration, communicated to that fluid the quality necessary for preserving animal life. As a proof of this it was urged, that life cannot be supported without respiration, and that air which hath been often breathed ceases to be capable of supporting life; because when once it has been totally deprived of its vivifying spirit, it can communicate none to the blood in any subsequent respirations.—This doctrine, however, hath been denied, and generally thought to be exploded by modern discoveries. Dr Hales brings several experiments against it; of which the following may serve for a specimen, and which we shall give in his own words.

“ I tied a middle-sized dog alive on a table, and, having laid bare his wind pipe, I cut it asunder just below the larynx, and fixed fast to it the small end of a common fossit: the other end of the fossit had a large bladder tied to it, which contained 162 cubic inches; and to the other end of the bladder was tied the great end of another fossit whose orifice was covered with a valve which opened inwards, so as to admit any air that was blown into the bladder, but none could return that way; yet, for further security, that passage was also stopped by a spigot.

“ As soon as the first fossit was tied fast to the wind-pipe, the bladder was blown full of air through the other fossit: when the dog had breathed the air in the bladder to and fro for a minute or to, he then breathed

Blood.

22. Vivifying spirit supposed to be derived from the air.

23. This doctrine hath been denied, and generally thought to be exploded by modern discoveries. Dr Hales brings several experiments against it; of which the following may serve for a specimen, and which we shall give in his own words.

24. Dr Hales' experiment against a vivifying spirit. *Statistical Essays*, Vol. P. 255.

Blood. very fast, and showed great uneasiness, as being almost suffocated.

"Then with my hand I pressed the bladder hard, so as to drive the air into his lungs with some force; and thereby make his abdomen rise by the pressure of the diaphragm, as in natural breathings; then taking alternately my hand off the bladder, the lungs with the abdomen subsided: I continued in this manner to make the dog breathe for an hour; during which time, I was obliged to blow fresh air into the bladder every five minutes, three parts in four of that air being either absorbed by the vapours in the lungs, or escaping through the ligatures upon my pressing hard on the bladder.

"During this hour, the dog was frequently near expiring, whenever I pressed the air but weakly into his lungs; as I found by his pulse, which was very plain to be felt in the great crural artery near the groin, which place an assistant held his finger on most part of the time: but the languid pulse was accelerated so as to beat fast, soon after I dilated the lungs much by pressing hard upon the bladder; especially when the motion of the lungs was promoted by pressing alternately the abdomen and the bladder, whereby both the contraction and dilatation of the lungs was increased.

"And I could by this means rouse the languid pulse whenever I pleased, not only at the end of every five minutes, when more air was blown into the bladder from a man's lungs, but also towards the end of the five minutes, when the air was fullest of fumes.

"At the end of the hour, I intended to try whether I could have by the same means kept the dog alive some time longer, when the bladder was filled with the fumes of burning brimstone; but being obliged to cease for a little time from pressing the air into his lungs, while matters were preparing for this additional experiment, in the mean time the dog died, which might otherwise have lived longer if I had continued to force the air into the lungs.

"Now, though this experiment was so frequently disturbed, by being obliged to blow more air into the bladder 12 times during the hour; yet since he was almost suffocated in less than two minutes, by breathing of himself to and fro the first air in the bladder, he would have died in less than two minutes when one fourth of the old air remained in the bladder, immediately to taint the new air admitted from a man's lungs; so that his continuing to live through the whole hour, must be owing to the forcible dilatation of the lungs by compressing the bladder, and not to the vivifying spirit of the air."

25. Dr Priestley's opinion. Dr Priestley at first concluded from his own observations, and no doubt very justly, that air which hath been often breathed becomes pernicious by its accumulated phlogiston, stimulating the lungs, and making the animal fall into convulsions. Respiration therefore, he supposed to be a phlogistic process, in which the blood parts with its superfluous phlogiston. He did not say, that the blood receives nothing in exchange; but rather that it may receive some vitious principle, which gives it the red colour: but as to a vivifying spirit, he doth not appear to have the least idea of any such thing being received at that time. Nay, in his first volume, p. 277. he expressly adopts the other hypothesis, namely, that the vital principle is received from the chyle. "My conjecture (says he)

is, that animals have a power of converting phlogiston, from the state in which they receive it in their nutriment, into that state in which it is called the *electrical fluid*; that the brain, besides its other proper uses, is the great laboratory and repository for this purpose; that by means of the nerves this great principle, thus exalted, is directed into the muscles, and forces them to act in the same manner as they are forced into action when the electric fluid is thrown into them *ab extra*."

These theories were opposed in the former edition of this work. With regard to Dr Hales's opinion, that the want of elasticity, or pressure, is the reason why phlogisticated air cannot support animal life, we apprehended it to be totally inconclusive, because it doth not at all appear that phlogisticated air wants elasticity; on the contrary, from Dr Priestley's experiments it appears to be more elastic than common air. Besides, we know that the elasticity of every fluid must always be in proportion to the pressure upon it, as reaction is always equal to action. Supposing therefore the elasticity of any portion of air to be destroyed, the pressure of the superincumbent atmosphere will reduce it into a proportionably less bulk, and then it is equally elastic with the rest; for if it was not, it would behave it still to yield under the pressure. Hence we may see, that as the bladder made use of in Dr Hales's experiment was by no means sufficient to keep off the pressure of the external atmosphere, the death of the dog could not be fairly ascribed to want of elasticity in the tainted air. When he applied more force than the natural elasticity of the air, he kept the dog *alive*, as he calls it, for an hour; but we can by no means allow a mechanical circulation of the blood to be life, any more than we can allow a dead body to be alive on account of the motion of its arm or any other member by mechanical means. The experiment, however, is valuable, because it shows that respiration is one of the immediate mechanical agents by which the circulation of the blood is carried on; but in order to prove that the dog was really kept alive by this means, he ought to have removed from the effects of the experiment. Had Dr Hales tried a similar experiment on himself, by taking the socket in his mouth, closing his nostrils, and causing another person compress the bladder, we have not the least doubt that he would then have felt such a method of breathing not to be a way of preserving life, but of destroying it.

As to Dr Priestley's conclusions, it was argued, that ^{26.} "though he found air diminished by admitting phlo-^{27.} the dim. nu- giston to it, Dr Priestley finds the mere accession of any tion of air material substance can never diminish, but must increase, by phlogi- its bulk. The diminution, therefore, on the accession of- tion, &c. phlogiston, is an evident proof that some part of the air is actually taken away. That the phlogiston received is not incorporated with the air is likewise evident, as well as that it takes up space in the tainted air, because, by agitation in water, the phlogistic matter separates from the air, and enters into the water. The consequence of this is, that the air is still farther diminished in bulk; and what remains is pure air, fit for supporting animal life, and of being farther diminished by phlogiston as before. It appears also certain, that phlogiston is not endowed with any inherent power by which it can expand itself; otherwise it would fly off *in vacuo*, which it never is known to do. Another circumstance

Blood.
26.
Dr Hales's experiment inconclusive

Blood.

we must also attend to is, that the action of phlogiston seems to be entirely confined to a particular part of the atmosphere; namely, that which is now so well known by the name of *fixed air*. This it entirely deprives of its elastic principle, so that it is actually no longer air, but becomes a solid substance, making a part, and that no inconsiderable one, of innumerable terrestrial substances, as chalk, lime-stone, &c."

That the justness of the conclusion about to be drawn from Dr Priestley's experiments may be more apparent, the phenomena were summed up in the two following propositions. "1. Phlogiston cannot act by itself without the assistance of air. 2. The emission of phlogiston is attended with the total destruction of the elasticity of a certain quantity of fixed air, which then ceases to be fluid. Hence we affirm, that it is not the phlogistic substance which acts upon the air, but the elastic principle in the fixed air contained in the common atmosphere that acts on the phlogistic substance. This elastic principle, entering the phlogistic body, displaces a quantity of phlogiston equivalent to its own quantity, and takes its place; and hence proceeds the first diminution of the air, not from an accession of phlogiston, but from an escape of the elastic principle belonging to fixed air. The phlogiston and fixed particles of the air now hang loose like smoke or vapour, and are ready to be attracted by any thing capable of imbibing them: and hence proceeds the second diminution by agitation in water.

28. Why a phlogistic substance parts with its phlogiston.

29. Proof of a reception of the vivifying principle from the air.

"Now to apply this reasoning to the point in question: The blood is found to emit phlogiston from the lungs at every expiration; therefore we affirm it hath received a proportional quantity of elastic vapour which it had not before. Again: The air expelled from the lungs is found to contain much of the fixable part floating loose, and capable of being attracted by lime-water, &c.; therefore we say, this elastic principle hath come from that part of the atmosphere. But, to put the matter beyond doubt, the very inspection of arterial and venous blood will show, that the first hath a quantity of elastic matter in it which the last wants; and as the brain as well as all other parts of the body are supplied with arterial blood, we think it abundantly evident, that this elastic principle is absolutely and essentially necessary to life; that it is continually expended thereon; and that it may be said with the utmost propriety, that every time we draw the air into our lungs, we receive a portion of vivifying or vital spirit from it into our blood. Add to all this, that many substances which are commonly observed to phlogisticate air, appear to receive an elastic spirit by so doing. Putrefying bodies swell: they would not do so *in vacuo*; and therefore we must conclude, that they receive this elastic principle which swells them from the external air, and experience shows that it is communicated by this fixable part of the atmosphere.

"The foregoing reasoning, which to us appeared sufficiently conclusive, leads to a very important discovery in natural philosophy, *viz.* That it is to the atmosphere, and to that particular part of it which goes by the name of *fixed air*, that we are every moment indebted for that vital spirit which animates our bodies, and is the immediate bond of union betwixt our immaterial spirit and this visible world. It may be asked indeed, If fixed air is capable of supplying this spirit in

30. Objection answered.

such plenty, how comes it to be so instantaneously fatal when breathed? The reply to this, however, is obvious: it communicates too great a degree of elasticity to the blood; whence the circulation is stopped, and instant death ensues. That this is really the case, appears from the following account of the symptoms observed on the dissection of persons who have been suffocated by this kind of air.

Blood.

"1. The vessels of the brain are gorged with blood, and the ventricles of that viscus are filled sometimes with a frothy, sometimes with a bloody serosity. 2. The trunk of the pulmonary artery is much distended, and the lungs appear nearly in a natural state. 3. The right ventricle and auricle of the heart, the venæ cavæ, and jugular veins, are full of frothy blood. 4. Bloody serosity is often found in the bronchiæ. 5. The trunk of the pulmonary veins, and the left auricle, are either empty, or almost empty, of blood. 6. The blood found in the places that have been mentioned, is generally fluid, and as it were in a dissolved state. It is easily extravasated into the cellular texture, of the head particularly, because it is in this part that it abounds most. 7. The epiglottis in suffocated persons is raised, and the glottis open and free. 8. The tongue is much swelled, and can hardly be contained within the mouth. 9. The eyes protrude, and preserve their lustre to the second or third day. They are often even brighter than natural. 10. The body preserves its heat for a long time. Nay the heat is sometimes greater than it is during life, or at least constantly with health. 11. The limbs are flexible for a long time after death. 12. The face is more swelled, and often more red than usual. 13. The neck and upper extremities are sometimes so much swelled, that they appear to be inflamed. These swellings, however, do not, like œdematous ones, preserve the impressions of the finger.

31. Appearances on the dissection of those suffocated by fixed air.

"This account seemed so much in favour of what we had already advanced concerning the action of fixed air, that no observation was made upon it farther than that this elastic principle would seem also to be the cause of animal-heat; for as the blood evidently received a vast quantity of elastic fluid, it also received a much greater proportion of heat than usual."

32. Fixed air supposed the cause of animal heat.

Such was the mode of reasoning adopted at that time, derived from the discoveries which had been made in *Aerology*. Succeeding discoveries, however, have made it evident, that fixed air is not one of the natural component parts of our atmosphere, but that it consists of two different fluids; one of which is commonly called *phlogisticated*, the other *dephlogisticated*, air. It is the latter which supplies the vital principle; and the above reasoning still holds good, only substituting the words *dephlogisticated air* for *fixed air*. The poisonous quality of the latter seems also still to depend on its too easy decomposition; by which means the elastic principle is discharged into the blood in such quantity as to burst the small vessels, as has already been observed. This is shown indeed by the remedies most proper for the recovery of those who have suffered from the noxious qualities of fixed air. These consist in evacuation, and especially sprinkling the body with cold water, in order to take off the superfluous heat, and produce an universal contraction of the vessels.

33. This theory corrected.

It now remains only to give some account of the means by which the circulation of the blood is carried

on in the living body. From the time of Harvey till very lately, this was supposed to be chiefly the muscular power of the heart and arteries, which by some physiologists have been thought to be prodigiously great; and accordingly many calculations, requiring no small degree of mathematical knowledge to understand them, have been made of the forces requisite to perform this circulation. Other physiologists, however, have thought proper to take in several auxiliary helps, as the motion of the muscles, respiration, &c. and from Dr Hales's experiment abovementioned it appears that respiration hath a considerable influence in this matter. It cannot, however, be the sole cause, seeing the circulation is carried on in animals which do not respire.—In 1773, Dr Willson, in the lecture already quoted, suggested a new principle of motion, which we believe was never used before to account for the circulation of animal fluids. It is shortly this: "As the fluids of the human body do all of them suffer a continual waste, and consequently require a constant supply in proportion, we must look upon their going out of the body to be the end of their motion, and on their entering into the body to be the beginning of it; and hence we are to look for the origin of all the motion of the fluids in that part of the system where the new supplies are taken in. This is the *prima vis*, where the lacteals absorb a fluid from the digested aliment, and convey it into the blood. The power by which this is accomplished, is necessarily independent of the heart, as having not the least connection with it. It has been said to be the same with that which causes fluids rise in capillary tubes; but though very probably the powers in both cases may be the same, there is this remarkable difference between them, that in the capillary tubes the fluids only rise to a certain height, and will not rise at all unless the tubes are empty. In the lacteals they rise in vessels already full, and continue to do so. Neither is the force whereby this absorption is performed to be accounted little; seeing the supply by the chyle must constantly be equal to the waste which is continually taking place in the fluids already contained in the vessels. We see also, with what force an absorption of this kind sometimes takes place in other cases; thus ropes will absorb water with such strength as to raise immense weights fastened to them, and which no mechanical injection of water into small tubes could possibly accomplish. What is already said of the lacteals applies also to the lymphatics; and from thence we are almost tempted to conclude, that the case is the same with the sanguiferous veins also; that though there may be a continuation of some arteries into the veins corresponding with them, yet that for the most part these vessels extravasate the blood into small cavities, which is then taken up by the absorbent power of the veins, and returned to the heart.

"If, however, the vessels continued absolutely full, it would be impossible that any motion could be carried on in them; and to continue and regulate the circulation, the heart with its cavities is provided. Let us suppose, that by the abovementioned power the veins are all full, and the auricles or chambers into which the veins empty themselves are full also: where is the collected stream in the veins to go next? There is no room for more in the auricle. What must be done? The auricle contracts and empties itself. The conse-

quence is a sudden vacuum equal to what the auricle could contain; the turbid veins, urged by the absorbing power abovementioned, rush their contents into the auricle to fill up the vacuum again, and all behind moving in the venous direction advances forward with so much force, that the veins near the heart sustain a pulsation from the regurgitation of this impetuous stream, when the auricle flatts upon it to empty itself. In short, the full auricle occupies a determinate quantity of space in the breast: when it is emptied, there is a nonresisting vacuum of so much space as was full before, and thither there is a mechanical nifus from the remotest filament of a vein over the whole body, which becomes conspicuous in the torrent that rushes every other moment from the mouth of the vena cava into this vacuum."

This is a short abstract of Dr Willson's new theory of the circulation. According to him, this absorbing power of the veins is the principle agent, while the heart and arteries do no more than empty themselves of the blood with which they are filled by the veins. Even this cause, however, he says, would not be sufficient to carry on the circulation for a single moment, without the presence of another which he calls *vis*, and does not consider as absolutely unmechanical, tho' we cannot reduce it either to mechanical rules or ideas. But as we apprehend all speculations concerning such causes must be arbitrary and without foundation, we forbear to give any account of the Doctor's opinions on this subject.

It hath been a general opinion, that blood, as it exills ^{30.} in the bodies of animals, contains a considerable quantity of common air; and indeed it is certain, that blood, while in the ^{30.} bodies of animals, after it has been drawn from the veins of any animal, and afterwards placed under the receiver of an air-pump, yields a very considerable quantity of air upon exhaling the receiver: but if a portion of any blood-vessel is tied up so as to prevent the escape of its contents, and then cut out of the body and placed under a receiver, it will not swell, or show the least sign of its containing any quantity of air whatever.

Blood was formerly held in great esteem as a medicine ^{37.} for some particular diseases. Baths of the blood of ^{37.} infants have been recommended as an infallible remedy ^{37.} for the elephantiasis, &c.; and the blood of goats and some other animals was used by the Galenists, and is recommended even by Dr Mead in pleuritis: but the first abominable medicine, as well as the other, is now deservedly exploded. The principal use of blood in the arts is for making Prussian blue, or sometimes for clarifying certain liquors; it is also recommended in agriculture as an excellent manure for fruit-trees. A mixture of blood with lime makes an exceedingly strong cement; and hence it is of use in the preparation of some chemical lutes, the making floors, &c.—As a food, ^{37.} it hath been disputed whether blood really affords any ^{37.} nourishment or not. The best judges now, however, ^{37.} are generally agreed that it is very nutritious; and tho' ^{37.} out of the body, like the white of an egg, it is very insoluble, yet, like that too, *in* the body it is commonly of easy digestion. It is, however, highly alealcescent in hot climates; on which account the prohibition of it to the Hradites was very proper. Even in this country, when blood was used as food in great quantity, the scurvy was more frequent than at other times; ^{37.}

Blood.

but to a moderate use of it here no such objection takes place.

In some countries we are told, that the barbarians were accustomed to intoxicate themselves by drinking the warm blood of animals; and as it has been shown that this fluid is the immediate reservoir of the vital principle, it seems by no means improbable that it may be possessed of an inebriating quality. Some expressions in Scripture seem to countenance this hypothesis.

Religious uses of Blood. Among the ancients blood was used for the sealing and ratifying covenants and alliances, which was done by the contracting parties drinking a little of each others blood; and for appeasing the manes of the dead, in order to which blood was offered on their tombs as part of the funeral ceremony.

The blood of victims was anciently the portion of the gods; and accordingly was poured or sprinkled on the altars in oblation to them.

The priests made another use of blood, *viz.* for divination: the streaming of blood from the earth, fire, and the like, was held a prodigy or omen of evil.

The Roman priests were not unacquainted with the use of blood in miracles: they had their fluxes of blood from images, ready to serve a turn; witness that said to have streamed from the statue of Minerva at Modena, before the battle at that place. But we know not whether in this their successors have not gone beyond them. How many relations in ecclesiastical writers of Madonnas, crucifixes, and wafers, bleeding? At least the liquefaction of the blood of St Januarius at Naples, repeated annually for so many ages, seems to transcend by far all the frauds of the Grecian or Roman priesthood. But the chemists at last got into the secret; and we find M. Neumann at Berlin to have performed the miracle of the liquefaction of dried blood, with all the circumstances of the Neapolitan experiment.

Among the schoolmen we find a famous dispute, under Pope Pius II. whether the blood of Christ, which fell from him in the three days passion, retained or lost the hypostatic union; and consequently whether it was the proper object of adoration. The Dominicans maintained the former, the Franciscans the latter. It seems the dominican doctrine gained the ascendant, as being fitted to favour the profits of the monks; who becoming possessed some way or other of a few drops of this precious liquor, were secured of ample offerings from the deluded laity, who flocked to pay their homage to the sacred relic. Joseph of Arimathea is said to have first brought into Britain two silver vessels filled with the blood of Christ, which by his order was buried in his tomb. King Henry III. had a crystal, containing a portion of the same blood, sent him by the master of the temple at Jerusalem, attested with the seals of the patriarch: which treasure the king committed to the church of St Peter's Westminster, and obtained from the bishops an indulgence of six years and 116 days to all that should visit it. Mat. Paris even assures us, that the king summoning his nobles and prelates to celebrate the feast of St Edward in St Peter's church, was chiefly *pro veneratione sancti sanguinis Christi nuper adepti*, "in veneration of the holy blood of Christ lately acquired." Divers others of our monasteries were possessed of this profitable relic; as the college of Bon Hom-

Blood.

mes at Ashridge, and the abbey of Hales, to whom it was given by Henry, son of Richard duke of Cornwall, and king of the Romans. To it resorted a great concourse of people for devotion and adoration; till in 1538, as the reformation took place, it was perceived to be only honey clarified and coloured with saffron, as was shown at Paul's cross by the bishop of Rochester. The like discovery was made of the blood of Christ, found among the relics in the abbey of Fecamp in Normandy, pretended to have been preserved by Nicodemus, when he took the body from the cross, and given to that abbey by William duke of Normandy: it was buried by his son Richard, and again discovered in 1171, and attended with different miracles; but the cheat, which had been long winked at, was at length exposed, the relation of which is given by Speed.

Avenger of Blood, among the Jews, was the next of kin to the person murdered, who was to pursue the murderer.

Ecclesiastical judges retire, when judgment is to be given in *cases of blood*, by reason the church is supposed to abhor blood: it condemns no person to death; and its members become irregular, or disabled from their functions, by the effusion of blood.

Field of BLOOD, in Syriae *aceldama*, was a field purchased by the Jews with the thirty pieces of silver which had been given to Judas for betraying his Master, and which he had restored. It still serves for a burial-ground, in which all pilgrims who die in their pilgrimage at Jerusalem are interred.

Blood-Hound, in zoology, the *canis sagax* of Linnæus*, *le chien courant* of Buffon, the *scouthound* of the Scots: The hound or dog, with long, smooth, and pendulous ears.—It was a dog of great use, and in high esteem with our ancestors: its employ was to recover any game that had escaped wounded from the hunter, or been killed and stole out of the forest. It was remarkable for the acuteness of its smell, tracing the lost beast by the blood it had spilt; from whence the name is derived. This species could, with the utmost certainty, discover the thief by following his footsteps, let the distance of his flight be ever so great, and through the most secret and thickest coverts: nor would it cease its pursuit till it had taken the felon. They were likewise used by Wallace and Bruce during the civil wars. The poetical historians of the two heroes frequently relate very curious passages on this subject; of the service these dogs were of to their masters, and the escapes they had from those of the enemy. The blood-hound was in great request on the confines of England and Scotland; where the borders were continually preying on the herds and flocks of their neighbours. The true blood-hound was large, strong, muscular, broad breasted, of a stern countenance, of a deep tan-colour, and generally marked with a black spot above each eye.

BLOOD-Shotten. See OPHTHALMIA.

BLOOD Spavin. See FARRIERY, § xxxii. 2.

Spitting of BLOOD, or *Hæmoptœ.* See MEDICINE-Index.

Whole and Half BLOOD; a kinsman of the *whole blood* is he that is derived from the same couple of ancestors; whereas a person of *half blood* descends from either of them singly by a second marriage.

BLOOD

Blood of Christ, the name of a military order instituted at Mantua in 1608. The number of knights was restricted to 20, besides the grand master. Their device was, *Domine, probasti me*; or, *Nihil hoc, triste, recepto*: "Lord, thou hast proved me;" or, "Fortified by this, no evil can prevail."

Precious Blood, a denomination given to a reformed congregation of Bernardine nuns at Paris, first established under that name in 1661.

Dragon's Blood. See DRAGON.

Blood-Stone. See HEMATITES.

Blood-Vessels. See ANATOMY, n^o 123, &c. and Plate XXXIII.

Blood-Wite, in ancient law writers, signifies *blood*, and a customary amercement paid as a composition for the shedding or drawing of blood. The word is also written *blodwite*, *blodwita*, *blodwytta*, *blodwit*, *blodwit*, *bloutwit*, and *bludwite*. It is formed from the ancient Saxon *blud*, "blood," and *wite* or *wyte*, "a fine or penalty." The word also denotes an exemption from this penalty granted by the king to certain persons and communities as a special favour. King Henry II. granted to all tenants within the honour of Wallingford—*Ut quieti sint de hidagio et blodwite et bredwite*.

Blood-Vert, in botany. See REMEX.

BLOOD (Thomas), generally known by the appellation of *Colonel Blood*, was a disbanded officer of Oliver Cromwell's, famous for his daring crimes and his good fortune. He was first distinguished by engaging in a conspiracy to surprise the castle of Dublin; which was defeated by the vigilance of the Duke of Ormond, and some of his accomplices were executed. Escaping to England, he meditated revenge against Ormond; and actually seized him one night in his coach at St James's-street, where he might have finished his purpose if he had not studied refinements in his vengeance. He bound him on horseback behind one of his associates, resolving to hang him at Tyburn, with a paper pinned to his breast: but when they got into the fields, the duke, in his efforts for liberty, threw himself and the assassin, to whom he was fastened, to the ground; and while they were struggling in the mire, he was rescued by his servants; but the authors of this attempt were not then discovered. A little after, in 1671, Blood formed a design of carrying off the crown and regalia from the tower; a design, to which he was prompted, as well by the surprising boldness of the enterprise, as by the views of profit. He was very near succeeding. He had bound and wounded Edwards the keeper of the jewel-office, and had got out of the tower with his prey; but was overtaken and seized, with some of his associates. One of them was known to have been concerned in the attempt upon Ormond; and Blood was immediately concluded to be the ringleader. When questioned, he frankly avowed the enterprise; but refused to discover his accomplices. "The fear of death (he said) should never engage him either to deny a guilt or betray a friend." All these extraordinary circumstances made him the general subject of conversation; and the king was moved with an idle curiosity to see and speak with a person so noted for his courage and his crimes. Blood might now esteem himself secure of pardon; and he wanted not address to improve the opportunity. He told Charles, that he had been engaged, with others, in a design to kill him

with a carabine above Battersea, where his majesty often went to bathe: that the cause of this resolution was the severity exercised over the consciences of the godly, in restraining the liberty of their religious assemblies: that when he had taken his stand among the reeds, full of these bloody resolutions, he found his heart checked with an awe of majesty; and he not only relented himself, but diverted his associates from their purpose: that he had long ago brought himself to an entire indifference about life, which he now gave for lost; yet could he not forbear warning the king of the danger which might attend his execution: that his associates had bound themselves by the strictest oaths to revenge the death of any of their confederacy; and that no precaution nor power could secure any one from the effects of their desperate resolutions. Whether these considerations excited fear or admiration in the king, they confirmed his resolution of granting a pardon to Blood; but he thought it a requisite point of decency first to obtain the Duke of Ormond's consent. Arlington came to Ormond in the king's name, and desired that he would not prosecute Blood, for reasons which he was commanded to give him. The duke replied, that his majesty's commands were the only reason that could be given; and being sufficient, he might therefore spare the rest. Charles carried his kindness to Blood still farther: he granted him an estate of L. 500 a-year in Ireland; he encouraged his attendance about his person; he showed him great countenance; and many applied to him for promoting their pretensions at court. And while old Edwards, who had bravely ventured his life, and had been wounded, in defending the crown and regalia, was forgotten and neglected, this man, who deserved only to be flared at and detested as a monster, became a kind of favourite.—Blood enjoyed his pension about 10 years, till being charged with fixing an imputation of a scandalous nature on the Duke of Buckingham, he was thrown into prison, where he died August 24. 1680.

BLOODY, something belonging to or abounding with blood.

Bloody-Flux. See MEDICINE-Index.

Bloody-Hand, is when a trespasser is apprehended in a forest with his hands or other parts bloody; which is a circumstance of his having killed the deer, though he be not found chasing or hunting them.

Bloody-Rain. See RAIN.

Bloody-Sweat. Many instances of this are recorded, in which it has been owing to bodily disorder, or extreme mental agitation and agony. See particularly Aristotle's Hist. Animal. lib. iii. cap. 19. apud Oper. tom. i. Thuanus Hist. Temp. &c. lib. ii. apud Oper. tom. i. Melanges d'Histoire et de Littérature, &c. par M. V. Mauville, tom. iii. p. 149. Acta Physico-Med. Norimbergæ, vol. i. p. 84. and vol. viii. p. 428.

Bloody-Urine. See MEDICINE-Index.

BLOOM, a mass of iron after having undergone the first hammering called *Hemary*. It has yet to undergo many hammerings before it become iron fit for the smith's use, and be first made what they call the *an-covy*. See ANCOVY.

BLOOT (Peter), a Flemish painter, whose works are not frequently seen in these kingdoms; nor are they easily purchased in Holland, being carefully preserved in private collections, and are highly esteemed.

Blood

Blood.

Blou
Blou t.

The subjects he chose to paint were always taken from the lowest life; such as boors drinking, feasting, dancing, or quarrelling; shepherds piping, and sometimes the marriages of villagers. He was a faithful, and indeed too servile an imitator of nature; never departing from the actions, attitudes, or draperies of his models. He showed a good knowledge of the chiaro-scuro, and perspective; he had a delicate manner of penciling, and his colouring was mellow; but he had no idea of elegance: yet his pictures have in many respects great merit, and his defects seem rather imputable to the taste of his country than to his own genius; some of his works being, for the lightness of the touch, the neatness of handling, and transparency of colour, equal to the best of his time. He died in 1667.

BLOSSOM, in a general sense, denotes the flower of any plant. See the article FLOWER.

BLOSSOM, in a more proper sense, is restrained to the flowers of trees, which they put forth in the spring as the forerunners of their fruit, otherwise called their *blom*. The office of the Blossom is partly to protect, and partly to draw nourishment to, the embryo, fruit, or seed.

BLOSSOM, or *Peach coloured*, in the manege, a term applied to a horse that has his hair white, but intermixed all over with forel and bay hairs. Such horses are so insensible and hard both in the mouth and the flanks, that they are scarce valued; besides they are apt to turn blind.

BLOSSOMING OR PLANTS, the act of blowing, or putting forth flowers or blossoms, called also *blowing*. The blossoming of the Glastenbury thorn piously on Christmas-day-morning, is a vulgar error; owing to this, that the plant, besides its usual blossoming in the spring, sometimes puts forth a few white transient blossoms in the middle of winter. For the blossoming of the rose of Jericho on the same day as it is commonly held in England, or in the time of midnight mass, as it is held in France, is somewhat more than an error, being really a fraud on one side, and a superstition on the other. This rose, whose leaves are only closed and shrivelled up in winter, will, at any time, upon setting its pedicle in water, expand and blossom a-new; because the pedicle being spongy imbibes the fluid apace, and thus fills and swells out the shrivelled leaves: which property some monks have turned to good account.

BLOTELING OR BLOOTELING (Abraham), an engraver who flourished about the year 1672. He was a native of Amsterdam, and designed as well as engraved. From the style of his etchings, which have great merit, he is supposed to have frequented the school of the Visschers. He came into England about the year 1672, or 1673, at the time the French invaded Holland; but he did not reside here long. He not only etched, but also scraped, several mezzotintos, which were much esteemed. Vertue informs us, that whilst he was in England, he received 30 guineas for an etching of the duke of Norfolk. From hence he returned to Amsterdam, where, in all probability, he died. In the year 1685, he published at Amsterdam the *gems* of Leonardo Angutino, and etched the plates himself.

BLOUNT (Thomas), a learned English writer of N^o 28.

the 17th century, born at Bourdesley in Worcestershire. He had not the advantage of an university education; but, by strength of genius and great application, made a considerable progress in literature. Upon the breaking out of the popish plot in the reign of king Charles II. being much alarmed on account of his being a zealous Roman-catholic, he contracted a palsy; and died in December 1679, aged 61. He wrote, 1. The academy of eloquence, containing a complete English rhetoric. 2. Glossographica, or a dictionary interpreting such hard words, whether Hebrew, Greek, Latin, Italian, &c. that are now used in our refined English tongue, &c. 3. Bosobol; or the history of his majesty's escape after the battle of Worcester. 4. A law dictionary. 5. Animadversions upon Sir Richard Baker's chronicle. 6. *Fragmenta Antiquitatis*; and other works.

BLOUNT (Sir Henry), an English writer, born at his father's seat in Hertfordshire in 1602. After a regular education, he set out on his travels in 1634; and getting acquainted with a janizary at Venice, he accompanied him into the Turkish dominions: having been abroad two years, he returned and published a relation of his travels in the Levant, which went thro' several editions. He was knighted by Charles I. and was at the battle of Edge-hill, at which time he is supposed to have had the charge of the young princes; but, after the king's death, was employed by the parliament, and by Cromwell. Yet after the restoration of the royal family he was appointed high sheriff of the county of Hertford, and from that time lived as a private gentleman above 20 years. He published, 1. An account of his travels. 2. Six comedies written by John Lilly, under the title of *Court Comedies*. 3. The exchange walk, a satire; and 4. An epistle in praise of tobacco. He died October 9th, 1682.

BLOUNT (Sir Thomas Pope), baronet, an eminent writer, and the eldest son of the former, was born at Upper Holloway, in the county of Middlesex, September 12th, 1649. He was educated under the eye of his father; and always distinguished himself as a lover of liberty, a sincere friend to his country, and a true patron of learning. He was advanced to the degree of baronet by king Charles II. in whose reign he was elected burgess for St Alban's in two parliaments, and was knight of the shire in three parliaments after the Revolution. He wrote in Latin, 1. A critique on the most celebrated writers. 2. Essays on several subjects. 3. A natural history, extracted out of the best modern writers; and, 4. Remarks upon poetry, with characters and censures of the most considerable poets, whether ancient or modern. He died June 30th, 1697.

BLOUNT (Charles), younger brother of Sir Thomas Pope Blount, had also an excellent capacity, and was an eminent writer. His *Anima Mundi*, or *An historical narration of the opinions of the ancients, concerning man's soul after this life, according to unenlightened nature*, gave great offence, and was complained of to the bishop of London. But the work which rendered him most known, was his translation of Philostratus's *Life of Apollonius Tyanicus*, published in 1680; which was soon suppressed, as an attack on revealed religion. Another work of the same complexion he published the same year, called *Great is Diana of the*

low. the *Ephesians*, &c. in which, under colour of exposing superstition, he struck at revelation. In 1684, he printed a kind of *Introduction to Polite Literature*. In the warmth of his zeal for the Revolution, he wrote a pamphlet to prove king William and queen Mary conquerors; which was condemned to be burnt by both houses of parliament. The close of his life was very unhappy. For, after the death of his wife, he became enamoured of her sister, who was only scrupulous against their union on account of their prior connection by the marriage; on which he writ a letter on the subject, as the case of a third person, with great learning and address. But the archbishop of Canterbury and other divines deciding against him, and the lady on this growing inflexible, it threw him into a frenzy in which he shot himself, in 1693. After his death, his miscellaneous pieces were collected and published.

BLOW (Dr John), a famous musician and composer, was a native of North Collingham in the county of Nottingham; and was one of the first set of children after the restoration, being bred up under Captain Henry Cook. He was also a pupil of Hingston, and after that of Dr Christopher Gibbons. On the 16th day of March, 1673, he was sworn one of the gentlemen of the chapel in the room of Roger Hill; and in July, 1674, upon the decease of Mr Pelham Humphrey, was appointed master of the children of the chapel. In 1685, he was made one of his majesty's private music; and in 1687, was appointed almoner and master of the choristers of the cathedral church of St Paul. Blow was not a graduate of either university; but archbishop Sancroft, in virtue of his own authority in that respect, conferred on him the degree of doctor in music. Upon the decease of Purcell in 1695, he became organist of Westminster-abbey. In the year 1699, he was appointed composer to his majesty, with a salary. Blow was a composer of anthems while a chapel-boy, and on the score of his merit was distinguished by Charles II. The king admired very much a little duet of Carissimi to the words 'Dite o Ciel,' and asked of Blow if he could imitate it. Blow modestly answered he would try; and composed in the same measure, and the same key of D with a minor third, that fine song, 'Go, peijured man.' The *Orpheus Britannicus* of Purcell had been published by his widow soon after his decease; and contained in it some of that author's finest songs: the favourable reception it met with was a motive with Blow to the publication in the year 1700, of a work of the same kind, entitled *Amphion Anglicus*, containing compositions for one, two, three, and four voices, with accompaniments of instrumental music, and a thorough-bass figured for the organ, harpsichord, or theorobone. To this book are prefixed commendatory verses by sundry persons; and among them an ode, in the second stanza of which are the following lines:

- ' His *Gloria Patri* long ago reach'd Rome,
- ' Sung and rever'd too in St Peter's dome;
- ' A canon will outlive her jubilees to come.'

The canon here meant is that fine one to which the *Gloria Patri* in Dr Blow's gamut service is set. Dr Blow set to music an ode for St Cecilia's day, in 1684, the words by Mr Oldham, published together with one

of Purcell on the same occasion performed the preceding year. He also composed and published a collection of lessons for the harpsichord or spinnet, and an ode on the death of Purcell, written by Mr Dryden. There are also extant of his composition sundry hymns printed in the *Harmonia Sacra*, and a great number of catches in the latter editions of the musical companion.—This great musician died in the year 1708, and lies buried in the north aisle of Westminster-abbey. On his monument is the canon above mentioned, engraven on a book with an inscription above it.

Blow, in a general sense, denotes a stroke given either with the hand, a weapon, or instrument. In fencing, blows differ from thrusts, as the former are given by striking, the latter by pushing.

Military Blow, *alapa militaris*, that given with a sword on the neck or shoulder of a candidate for knighthood, in the ceremony of dubbing him. The custom seems to have taken its rise from the ancient ceremony of manumission. In giving the blow, the prince used the formula *Esse bonus miles*, "Be a valiant soldier;" upon which the party rose a complete knight, and qualified to bear arms in his own right.

Blow, in law. See BATTERY.

Ely-Blows, the ova of flies deposited on flesh, or other substances proper for hatching them.

Blow-Pipe, in chemistry and mineralogy, an instrument by which the blast of the breath may be directed upon the flame of a lamp or candle, in such a manner as to vitrify any small portion of mineral substance; and thus the process of assaying in the dry way may be performed in a very short time, where either want of instruments or opportunity prevent other methods from being used.

Mr Bergman observes that this instrument is extremely useful to chemists, as many experiments are daily neglected, either because they require furnaces and a huge apparatus of vessels; from the want of time to examine them in the ordinary way; or from the quantity required in the common way for examination, when the matter may be too scarce or too dear. In all these cases the blow-pipe may be advantageously used; as, 1. Most of the experiments which can be performed in the large way may also be done with the blow-pipe. 2. The experiments which in the large way require many hours, may in this method be finished in a few minutes; and, 3. The smallest particle is sufficient. The only defect is, that the proportions cannot be determined with any precision; and therefore where the experiments can be tried on a large scale, it is always to be preferred. "But the first inquiry to be made," says our author, "is, *what* a substance contains, not *how much*; and I have learned by the experience of many years, that these trials in small suggest the proper methods of instituting experiments in large. These experiments besides have some advantage over those conducted in crucibles, *viz.* we can see all the phenomena from beginning to end, which wonderfully illustrates the series of operations and their causes. Experiments made in crucibles are often fallacious, as the substance of the vessel itself is corroded. We suppose that lime or magnesia melted with fixed alkali are united with it in the way of solution;

Blow,
Blow-pipe.

The blow-pipe is useful to chemists.

In what cases it may be advantageously employed.

Blow-pipe. tion; but the globule, when well fused in the spoon, by its transparency permits us plainly to see that, except the sliceous part, it is only mechanically mixed. The most intense degree of heat may in this way be obtained in a few minutes, which can scarcely be done in a crucible in many hours."

3
When the instrument was first introduced.

4
Bergman's description of the blow-pipe.

Plate XCIX.

The blow-pipe was first introduced into the chemical apparatus about 50 years ago by the celebrated Swedish metallurgist Dr Andreas Swab, and the instrument was afterwards greatly improved by Messrs Cronstedt, Rinman, &c. and Dr Engestrom has an express treatise upon the subject. Mr Bergman proposes that the tube should be made of pure silver, to prevent it from being injured by rust; with the addition of a small quantity of platina, to give a necessary hardness. It consists of three parts, which may be occasionally joined: An handle (fig. 3.) terminating in a truncated conical apex *a a*, which may by twisting be so adapted to the aperture *b* (fig. 4.) as to shut it more closely than can be done by a screw. It was an improvement of former chemists to have a hollow ball on the tube to collect the moisture of the breath, which if suffered to accumulate would greatly diminish the intensity of the flame. Instead of this Mr Bergman made use of the little box (fig. 4.) formed of an elliptical plate, so bended through the centre that the opposite sides become parallel, and are joined round by a plate equal in breadth to *c c*. Such a box collects the moisture of the breath as well as the sphere, and is besides attended with the advantage of a compressed figure and smaller circumference. The aperture *b* is somewhat conical, and hollowed out of the solid piece; and has no margin turned inward, lest the efflux of the fluid collected after long blowing, or the cleansing of the internal parts, should in any degree be prevented. The tube (fig. 5.) is very small, and its shorter conical end *e e* exactly fitted to the aperture *f*, so that no air can escape except through the orifice *g*. Many of those tubes should be provided with orifices of different diameters, to be applied on different occasions: the orifice *g* itself ought to be smooth and circular, otherwise the cone of flame hereafter to be mentioned will be divided. The bands (*bb ii*) prevent the conical apices (*aa, ee*) from being thrust in too far, and also serve another purpose; for when these apices are, by repeated attrition, at last so much diminished as to fall out spontaneously, by filing away a little of the bands they may again be made tight. The figures represent the whole apparatus of the proper size.

Fig. 3, 5.

5
How to supply it with a constant stream of air.

The greatest difficulty attending the use of the blow-pipe is the supplying it with a constant stream of air by means of the breath; for to such as are unaccustomed to it, it appears a contradiction to think of blowing a stream of air out by the mouth, at the same time that we are drawing it in by the nostrils to supply the necessary functions of respiration. An uninterrupted stream of air, however, is absolutely necessary; and, "to succeed in this operation (says Mr Bergman) without inconvenience, some labour and practice are necessary. The whole artifice, however, consists in this, that while the air is inspired through the nostrils, that which is contained in the mouth be forced out through the tube by the compression of the cheeks. To some persons this is extremely difficult; but fre-

quent trials will establish the habit; so that a continual stream of air can be supplied for a quarter of an hour or more, without any other inconvenience than the lassitude of the lips compressing the tube. A very great and obvious improvement, however, is suggested by Dr Berkenhout, viz. to apply the tube to the wind-bag of a bagpipe; which being first blown full, may easily be kept so; and being compressed by the arm, will produce a blast either strong or weak as we have a mind. It will be a still farther improvement to supply this bag by means of a small bellows instead of blowing into it with the mouth: for thus the air will be more free from moisture, and also fitter for the support of flame, in other respects; as there is always a considerable quantity of fixed air produced at every respiration, which, according to that quantity, must unfit the air for keeping up the flame, and consequently render the heat less intense.

Blow-pipe
6
Dr Berkenhout's improvement

With regard to the flame proper to be chosen, Mr Bergman directs a slender candle, either of wax or tallow (fig. 6.), with a cotton wick (*k l*). The burned top must be cut at such a length, that the remainder may be bent a little (*lm*). The orifice (*g*) is to be held above and near to this arch, perpendicular to (*lm*), and the air equably expressed. The flame being forced to one side by the violence of the blast, exhibits two distinct figures; the internal figure (*ln*), conical, blue, and well defined; at the apex of this, *n*, the most violent heat is excited; the external flame (*lo*), brownish, vague, and indetermined; which is spoiled of its phlogiston by the surrounding atmosphere, and occasions much less heat at its extremity (*o*) than the interior flame does.

7
A candle proper for producing the flame

8
Two kinds of flame produced by the blow-pipe

Dr Black, as well as all other eminent chemists, greatly recommend the use of the blow-pipe for chemical experiments on minerals. The construction recommended by him differs not from that already described; only he says, that it may be made of tin, a cheaper material than silver; though formerly they were made of glass. The small stream of air issuing from the extremity of the tube, being more intimately mixed with the flame, and agitated with it, occasions a more complete consumption of the vapour arising from the candle, and makes it produce much more heat; so that any small body exposed to the extremity of the flame is heated to a surprising degree. Several artists who work in metals, as the goldsmiths, &c. find this instrument useful in soldering small pieces of metal together; and it is also used by the chemists in examining the effects of violent heat upon small bodies. Some of the artists who use it much, supply the stream of air with a pair of bellows placed under the table, with a pipe rising up through it, and to which the blow-pipe is fixed. In the examination of ores, the more simple instrument is preferred; and by a little practice it is easy to blow a continued stream of air with the mouth, by keeping it always full, and drawing in the air by the nostrils, which answers the same purpose as the upper part of a double bellows. Mr Cronstedt used the blow-pipe much in making the experiments on which his system of mineralogy is founded, blowing air through a bit of charcoal: and though the specimens are small, we can see the changes they undergo as well as if they were larger; and the eye can be assisted by a magnifying glass.

9
Dr Black directs concerning this instrument

10
Blow-pipe useful in soldering &c.

1 The reason of the intense heat produced by the blow-pipe is, that in the ordinary way of burning, the air acts only upon the external surface of the fuel, so that it is not so completely inflamed.

2 The blow-pipe used by Mr Cronstedt is composed of two parts; and this for the facility both of making, carrying it along, and cleansing it in the inside when necessary. The two parts are represented separate †, and of the true size; the figure of the instrument, when these are put together, may be easily conceived. The globe *a* (fig. 2.) is hollow, and made on purpose to condense the vapours, which always happen to be in the blow-pipe when it has been used some time: if this globe was not there, the vapours would go directly with the wind out into the flame, and thereby cool the assay. The hole in the small end *b*, through which the wind comes out, ought not to be larger than the size of the finest wire. This hole may now and then happen to be stopped up by something coming into it, so as to hinder the force of the wind: one ought therefore to have a piece of the finest wire, to clear it with when required; and, in order to have this wire the better at hand, it may be fastened round the blow-pipe, in such a manner as is represented in fig. 1: *c* is the wire fastened round the blow-pipe, and afterwards drawn through a small hole at *e*, made in the ring *f*, to keep it more steady. In order to determine the most convenient proportions of this instrument, several blow-pipes of different sizes, both bigger and smaller, have been tried: the former have required too much wind; and the latter, being too soon filled with the wind, have returned it back again upon the lungs: both these circumstances hindered greatly the experiments, and are perhaps even prejudicial to the health. The size here given is found to answer best; and though the hole must be as small as abovementioned, yet the sides of the pipe at the point must not be thinner, nor the point narrower, than here represented, else it will be too weak, and not give so good a flame. It is also to be observed, that the canal throughout the pipe, but particularly the hole at the small end, must be made very smooth, so that there be no inequalities in it; the wind would else be divided, and consequently the flame made double. That blow-pipe is to be reckoned the best, through which can be formed the longest and most pointed flame from off a common-sized candle. These blow-pipes are commonly made of brass or silver.

3 There are two different kinds of matter made use of for the support of those substances usually examined by the blow-pipe: the one is charcoal of bir, or beech, cut into the form of a parallelopiped; the other a silver spoon, which is better, a golden spoon, fitted with a wooden handle. The former is generally used, excepting where phlogiston is to be avoided, or the subject of examination is apt to be absorbed by the charcoal. The golden spoon should be much less than the figure (7.) as the bulk of the support prevents the heat from being raised to a proper degree. To prevent the fine light particles from being carried off by the blast, a small cavity should be hollowed out in the charcoal; in which, being partly protected by another smaller piece of charcoal, they may be exposed to the apex of the flame.

Were it possible to procure a sufficient quantity of

dephlogisticated air, experiments with the blow-pipe could be rendered still more important than they are, as we might by this means be able to fuse and vitrify substances *per se*, which we are now scarce able to do with the most powerful fluxes. The difficulty of procuring this kind of air, however, has as yet, in a great measure, excluded the use of it from chemistry, though M. le Blond, *Medecin Naturalist du Roi*, in a letter to the editor of the *Journal de Physique* for February 1787, proposes, instead of blowing through the tube, to adapt to the wide end of it a leathern bag, the size of an ox's bladder, filled with pure air. Were this bag made to communicate, by means of a pair of small bellows, with a reservoir containing a considerable quantity of this dephlogisticated air, there is no doubt that many chemical operations might by its means be very advantageously performed; and we are already assured, that, by the use of this kind of air, platinum itself may be melted. As dephlogisticated air, however, has not yet come into use, we can only expect such effects as may be produced by a violent blast of common atmospheric air; and for this purpose we must accommodate ourselves with proper fluxes. The following are recommended by Mr Bergman.

1. The phosphoric acid, or rather the microcosmic salt, as it is called, which contains that acid partly saturated with mineral, partly with volatile alkali, and loaded besides with much water and a gelatinous fat. This salt, when exposed to the flame, boils and foams violently, with a continual crackling noise, until the water and volatile alkali have flown off; afterwards it is less agitated, sending forth something like black foam arising from the burned gelatinous part: these, however, are soon dispelled, and exhibit a pellucid sphericle encompassed by a beautiful green cloud, which is occasioned by the delagation of the phosphorus arising from the extrication of the acid by means of the inflammable matter. The clear globule which remains, upon the removal of the flame, continues longer soft than that formed by borax; and therefore is more fit for the addition of the matter to be dissolved. The volatile alkali is expelled by the fire; therefore an excess of acid remains in what is left behind, which readily attracts moisture in a cool place.

2. The mineral alkali, or sal sodæ, when put upon charcoal, melts superficially, penetrates the charcoal with a crackling noise, and then disappears. In the spoon it yields a permanent and pellucid sphericle as long as it is kept fluid by the blue apex of the flame; but when the heat is diminished, it becomes opaque, and assumes a milky colour. It attacks several earthy matters, particularly those of the siliceous kind, but cannot be employed on charcoal for the reasons assigned above.

3. Crystallized borax, exposed to the flame urged by the blow-pipe or charcoal, first becomes opaque, white, and excessively swelled, with various protuberances, or branches proceeding out from it. When the water is expelled, it early collects itself into a mass, which, when well fused, yields a transparent sphericle, retaining its transparency even after cooling. If calcined borax be employed, the clear sphericle is obtained the sooner.

Having thus provided every thing necessary, the following directions are next to be attended to.

18
Directions with regard to the candle.

1. A common tallow candle, not too thick, is generally preferable to a wax candle, or to a lamp. The snuff must not be cut too short, as the wick should bend towards the object.

19
With regard to the matter exposed to the flame.

2. The weaker exterior flame must first be directed upon the object, until its effects be discovered; after which the interior flame must be applied.

3. We must observe with attention whether the matter decrepitates, splits, swells, vegetates, boils, &c.

4. The piece exposed to the flame should scarce ever exceed the size of a pepper-corn; but ought always to be large enough to be taken up by the forceps (fig. 10.) When the particle is too large, part of it must necessarily be without the focus; and thus cool both the support and the part immersed in the blue apex *z* (fig. 6.). It may, however, be broken into pieces sufficiently small by means of the hammer (fig. 8.), upon the steel plate (fig. 9.); any of the small parts being prevented from flying off by the ring *h*.

5. A small piece should be added separately to each of the fluxes: concerning which it must be observed, whether it dissolves wholly, or only in part; whether this be effected with or without effervescence, quickly or slowly; whether the mass be divided into a powder, or gradually and externally corroded; with what colour the glass is tinged; and whether it becomes opaque, or remains pellucid.

Having given these directions, our author (Mr Bergman) proceeds next to consider the subjects proper to be examined by the blow-pipe. These he divides into four classes: 1. Saline; 2. Earthy; 3. Inflammable; and, 4. Metallic.

20
Properties of salts when exposed to the action of the blow-pipe.

1. The *Salts*, though distinguished by their taste and solubility in water, differ so much in degree, that it is impossible to distinguish them absolutely from the earths by any natural boundaries. Many of them, when exposed to the flame, easily melt by the water of crystallization they contain. After this is dissipated, they split; and by a more intense heat are readily fused: others are deprived of their water without any fusion; and then melt once by a heat more or less intense, according to their nature; and some fly off with the heat.

21
Of the acid of arsenic.

Acids in general cannot bear the action of the blow-pipe, such at least as are easily kept in a fluid state. It is otherwise, however, with some of those which appear solids. The acid of arsenic upon charcoal attracts the inflammable matter, generates white arsenic, and flies off in vapours. In the spoon it melts without emitting smoke, unless it can acquire phlogiston either from the support on which it is placed, or the flame of the candle.

22
Of molybdæna.

The acid of molybdæna, according to our author, seems to be the basis of some metal, as it has a specific gravity of 3,461, possesses the property of tinging fluxes, and decomposing the phlogiticated alkali; he adds, "Is this the acid of tin?" This acid is absorbed by charcoal; and in the spoon emits a white smoke, which on touching the apex of the interior flame, assumes a beautiful blue colour, and again grows white upon exposure to the exterior flame. It tinges microcosmic salt of a fine green; borax assumes an ash-colour by reflection, but has a dark violet when we look through it. The acid of borax, commonly called *sal seductivus*, easily liquefies, in the same manner with borax itself, but does not swell so much as that salt does. It leaves a fixed pellucid glo-

23
Of borax.

bule. Acid of tartar liquefies on the first contact of the exterior flame, swells, foams, grows black, and sends forth a smoke and blue flame, leaving a spongy coal, the greatest part of which is soon converted into ashes of a calcareous nature. The combustion, however, must be slow, and the weakest part of the flame only employed, in order to observe these changes distinctly. By the contact of the exterior flame, crystallized acid of sugar is first made of an opaque white, then melts, and, lastly, flies off without leaving any residuum. Acid of phosphorus easily melts into a pellucid globule, which afterwards deliquesces in the air. Of crystallized vegetable alkali first becomes opaque, and decrepitates long and violently; then melts into a globule, which remains in the spoon; but expands on charcoal, and is absorbed with a crackling noise. The volatile alkali liquefies a little, and is then dissipated.

Several of the neutral salts flow twice, according to the quantity of water they contain in their crystals. The decrepitating salts are broken and dispersed by a sudden heat. Of this kind are vitriolated tartar, vitriolic sal ammoniac, common salt, and sal digestivus. Those which have a volatile alkali for their basis, fly off in a very short time.—By the application of the external flame, salt of amber laid on charcoal liquefies and smokes, the contact of the internal flame sets it on fire, and it continues to burn with a blue flame till it totally disappears. The same thing takes place when it is put in the spoon, excepting when it contains too great a quantity of oil, which indeed very frequently happens. In this case some traces of coal are to be met with. The spurious salt of amber presents different phenomena according to the substances made use of in adulterating it.

The detonating salts, into which the nitrous acid always enters as a component part, liquefy in the spoon, and are not decomposed on the charcoal until it takes fire: they are then decomposed with violent flame and noise, but which is different in degree according to the basis with which the nitrous acid is united. Thus the nitrous acid combined with vegetable alkali burns with a blue flame, but with the mineral and volatile alkali has a yellow one.

The carbonaceous salts yield spongy coals by the combustion of their acid, which by ignition becomes white, leaving their alkaline basis pure behind them. These are the acid of tartar, crude tartar, salt of sorrel, and tartarized mineral and vegetable alkali.

The hepatic salts, when put on charcoal, melt into a red or yellow mass, which diffuses an hepatic smell, especially when moistened by an acid. To this class belong all those fixed in the fire which contain the vitriolic acid, and which when saturated with phlogiston produces sulphur; such as vitriolated tartar and Glauber's salt.

Few of the earthy salts flow sufficiently thin to be reduced into a perfect globule; nor do they all actually enter into fusion, though the water of crystallization excites a great foam by its going off. Those which contain the vitriolic acid effervesce violently with borax and microcosmic salt, but are dissolved with difficulty by the salt of soda.

33
Earthy salts.

34
Intumescient salts.

Alum

Blow-pipe. Alum is somewhat different; for finally all ebullition ceases, and the mass remains incapable of further change by fire than to split. When hot, it is variegated with blue spots. 3. A combination of lime with acetous acid swells much like alum, but scarcely adheres to the charcoal. 4. Nitrated magnesia swells with a crackling noise, but without any detonation. 5. To this class also belongs the combination of marine acid with magnesia.

35 Gypsum eluded the utmost force of Mr Pott's furnace, but may be fused in a moment by exposing a section of the lamella to the blue flame. Though naturally pellucid, it instantly becomes opaque; and the water it contains flies off without any ebullition.

36 The following substances are soluble in borax and microcosmic salt with effervescence.

36 1. Lime, magnesia, alum, and combination of lime with acetous acid.

36 2. The metallic salts which do not decrepitate. Some of these containing either a large quantity of water in their crystals, or obstinately retaining their acid, flow in the fire, while others only foam. Most of them recover, in part at least, their metallic appearance, especially when they touch the coal, leaving at the same time a shapeless scoria. By the addition of borax, the scoriae are dissolved, and the regulus better collected; the fluxes are tinged in the same manner as by the metallic cakes.

36 3. The decrepitating metallic salts; lead combined with nitrous acid, and antimony with that of tartar.

36 4. Volatile metallic salts which have mercury for their basis. Those which contain marine acid in general fly off more quickly than those in which the metal is combined with any other menstruum.

36 5. Detonating metallic salts, as silver, mercury, lead, and bismuth united with nitrous acid.

36 6. The intumescent metallic salts, vitriolated and nitrated copper, iron and cobalt vitriolated, and nitrated zinc. These swell with noise and a certain degree of ebullition on the first contact of the flame, but afterwards remain unchanged.

36 7. The fusible metallic salts, as silver and lead combined with vitriolic acid, and zinc combined with marine acid.

36 8. Antimony combined with acid of tartar, a carbonate metallic salt.

37 9. Metallic salts communicating a certain colour to the flame. Blue vitriol, and solution of copper in nitrous acid, produce a greenness; but solution of copper in spirit of salt acts with much more efficacy. The green crystals of this salt grow red by the contact of the external flame; afterwards they liquefy and grow black, making the flame at first of a deep blue, which afterward verges to a green. The flame thus tinged expands much, and remains in that state until the whole of the salt be dissipated. This green salt, added to microcosmic salt in fusion, immediately flows a beautiful flame: the clear globule is tinged green, and does not grow opaque or brown, unless a large quantity of the microcosmic salt be added; a circumstance which takes place much sooner on adding a small quantity of borax.

38 11. *Earthy Substances.*—1. Crude calcareous earth effervesces a little with mineral alkali, and is divided in-

to small particles, but sparingly dissolved. When over-burned, it seems not to be divided or diminished. The former dissolves in borax with effervescence; but the latter scarcely produces any bubbles. The same phenomena takes place with microcosmic acid, only the effervescence is somewhat greater. A very small piece of calcareous earth is easily dissolved in borax and microcosmic salt, yielding quite pellucid spherules: but if more earth be gradually added, the flux, saturated at length, retains the dissolved matter indeed while in perfect fusion, but on removing it from the flame, the part which was taken up by the heat alone soon separates. Hence clouds first begin to appear, and at length the whole globule becomes opaque, but recovers its transparency again by fusion. If the melted pellucid globule, however, which would grow opaque by cooling, be plunged while hot into melting tallow, water, or other substances likewise hot (for cold generally cracks it), so as to grow suddenly hard, it retains its transparency; the particles being as it were fixed in that state which is necessary to transparency.

39 2. Terra ponderosa, exposed alone to the flame, becomes caustic, soluble in water, and loses its property of effervescing with acids. It effervesces a little, and is sensibly diminished by salt of soda; dissolves with a slight effervescence in borax, as well as in microcosmic salt, but effervesces somewhat more violently in the latter.

40 3. Magnesia by itself loses its aerial acid, and with it the property of effervescing with acids. In salt of soda, it is scarcely diminished, but effervesces a little. It dissolves in borax also, with a slight effervescence; and likewise in microcosmic salt, but with a greater effervescence.

41 4. Common clay contains a number of heterogeneous particles, particularly siliceous earth, of which the quantity is generally one half of the whole. When pure clay therefore is required, the earth of alum digested in an alkaline lixivium, and well washed, must be employed. This earth, on exposure to the flame, grows hard, contracts in bulk, but does not melt. It effervesces a little in sal soda, but is sparingly dissolved. In borax it dissolves with a very considerable effervescence, and with a still greater in microcosmic acid.

42 5. Siliceous earth, by itself, is not fused. In sal soda it dissolves with remarkable effervescence; and if the siliceous earth dissolved exceeds the weight of the flux, it yields a pellucid glass. This, and all the other operations with sal soda, must be performed in a spoon. In borax it dissolves slowly, without any effervescence; and in a similar manner, only still more slowly, in microcosmic acid.

43 Mr Bergman next enumerates the various earths of all different kinds which he had subjected to the blow-pipe; and of these he found that the following did not without the utmost difficulty show any signs of fusion: viz. Pure albeilos, refractory clay, pure mica, sapphire, flint, and steatite. The four last are indurated by fire. Of the same kind are the chrysolite and emerald, chalcidony, cornelian, hydrophorus, siliceous, jasper, onyx, opal, and quartz. The rest are fusible either by themselves or with the addition of proper fluxes. On these, he observes, in general, that when the effervescence is to be examined, only a very little piece of the matter is

Blow-pipe. is to be added to the flux; as the most subtil powder contains air, which being expelled by the heat, forms an appearance of effervescence. 2. The solution is often accelerated by lime, spathum ponderosum, gypsum, and other additions. 3. Gypsum alone is often an excellent flux. With an equal quantity of mineral fluor it is easily reduced to a pellucid globule, which grows white and opaque on cooling. The spathum ponderosum also unites with mineral fluor; but the mass does not become pellucid.

44
Of inflammable substances. III. Most *Inflammable Substances*, when exposed to the apex of the flame, begin to liquefy, unless they have a great quantity of earth in their composition; which, however, does not generally prevent their inflammation. When they are once inflamed, the blast ought to be stopped until they have burned away either alone or with a flux; after which the residuum is to be examined by the flame. The most remarkable appearances exhibited by inflammable substances, when examined by the blow-pipe, are the following:

45
Ambergris. 1. Ambergris burns with a white, smoky, and odoriferous flame, until it be totally consumed; but when impure, it is extinguished, leaving behind a black mass which soon grows white by ignition, and consists partly of calcareous powder. 2. Transparent amber exhibits almost the same appearance, but vanishes totally by heat in the spoon: so that in this way we can scarcely form any judgment of the residuum; which, however, is easily obtained from opaque amber.

46
Amber.

47
Asphaltum, &c. 3. Pure asphaltum burns with smoke, and is totally consumed without any residuum. 4. Mountain pitch leaves black scoriae, shining, and of a brittle nature.

48
Sulphur. 5. Bituminous schist and lithanthrax, besides their matrix, leave an oily coal, or even spongy scoriae, if the residuum liquefies at all. 6. Common sulphur readily melts alone, and grows red; after which it takes fire, and is consumed with a blue flame and a most penetrating and suffocating odour. 7. Molybdæna contains a portion of common sulphur united to a peculiar acid. It does not take fire, and suffers but little change on the charcoal; but on being exposed to the flame in the spoon, it deposits a white smoke in direction of the blast. This smoke grows blue by the contact of the interior flame, but loses its colour by the exterior one. It undergoes little change by borax or the microcosmic salt, but dissolves in salt of soda with violent effervescence. It grows red and transparent by fusion; and when cold, assumes a dilute red colour and opaque, with an hepatic smell. 8. Plumbago emits smoke on burning, but which is only perceptible the instant the flame ceases. It differs from molybdæna in not depositing any white powder, and particularly in not being taken up by salt of soda. It is not changed by borax or microcosmic salt.

49
Molybdæna.

50
Plumbago.

51
Inflammable ores. Inflammable ores take fire with difficulty; some are scarcely changed, while others are consumed or fly off, leaving the metallic calx behind.

52
Of the fluxes. The fluxes in general are tinged by phlogiston; but unless this be fixed by some metallic calx, it is easily destroyed by burning.

53
Of the perfect metals. IV. The perfect Metals lose no part of their phlogiston even in the most intense heat; and when calcined in the most way, recover their former nature by simple fusion. The imperfect metals are calcined by fire, especially by the exterior flame; and then, in order to

their being reduced, indispensably require the contact of a phlogistic substance. With respect to fusibility, the two extremes are mercury and platina; the former being scarce ever seen in a solid form, and the latter almost as difficult of fusion. The metals therefore may be ranked in this order, according to their degrees of fusibility. 1. Mercury. 2. Tin. 3. Bismuth. 4. Lead. 5. Zinc. 6. Antimony. 7. Silver. 8. Gold. 9. Arsenic. 10. Cobalt. 11. Nickel. 12. Iron. 13. Manganese. 14. Platina. The two last do not yield to the blow-pipe, and indeed forged iron does not melt without difficulty; but cast iron perfectly.

Metals in fusion affect a globular form, and easily roll off the charcoal, especially when of the size of a grain of pepper. Smaller pieces therefore ought either to be used, or they should be placed in hollows made in the charcoal. On their first melting they assume a polished surface, an appearance always retained by the perfect metals; but the imperfect are soon obscured by a pellicle formed of the calx of the metal. The colours communicated by the calces vary according to the nature of the metal from which the calx is produced. Some of the calces easily recover their metallic form by simple exposure to flame upon the charcoal; others are reduced in this way with more difficulty; and some not at all. The reduced calces of the volatile metals immediately fly off from the charcoal. In the spoon they exhibit nitrous globules; but it is very difficult to prevent them from being first dissipated by the blast.

The metals are taken up by the fluxes: but as mineral alkali yields an opaque spherule, it is not to be made use of. Globules of borax dissolve and melt any metallic calx; and unless too much loaded with it, appear pellucid and coloured. A piece of metal calcined in the flux produces the same effect, but more slowly. A portion of the calx generally recovers its metallic form, and floats on the melted matter like one or more excrescences. In proportion as the globule is more loaded it extends itself more on the charcoal, and at length cannot assume a globular form; for the metallic addition augments the attraction for phlogiston.

The calces of the perfect metals are reduced by borax in the spoon, and adhere to it at the point of contact, and there only. The microcosmic salt acts like borax, but does not reduce the metals. It attacks them more powerfully on account of its acid nature; at the same time it preserves the spherical form, and therefore is adapted in a peculiar manner to the investigation of metals.

The tinge communicated to the flux frequently varies, being different in the fused and in the cooled globule; for some of the dissolved calces, while fused, show no colour, but acquire one while cooling; but others, on the contrary, have a much more intense colour while in the state of fluidity. Should the transparency be injured by too great a concentration of colour, the globule, on compressing it with the forceps, or drawing it out into a thread, will exhibit a thin and transparent mass: but if the opacity arises from supersaturation, more flux must be added; and as the fluxes attract the metals with unequal forces, the latter precipitate one another.

Metals when mineralized by acids have the properties

Blow-pipe.

General appearance of metals before the blow-pipe.

57
Fluxes, general use of them.

58
Reduction of the calces of perfect metals.

59
Colours acquired by the fluxes.

Blow-pipe. exposing cinnabar to the fire on a polished piece of copper, the mercurial globules are fixed upon it all round.

68
Lead in its metallic state.

Lead, in its metallic state, readily melts, and continues to retain a metallic splendor for some time. By a more intense heat it boils and smokes, forming a yellow circle upon the charcoal. It communicates a yellow colour, scarce visible, to the fluxes; and when the quantity is large, the globule, on cooling, contracts more or less of a white opacity. It is not precipitated by copper when dissolved; nor do the metals precipitate it from sulphur in the same order as from the acids. When united to aerial acid, it grows red on the first touch of the flame: when the heat is increased, it melts, and is reduced to a multitude of small globules. When united with phosphoric acid, it melts and yields an opaque globule, but is not reduced. With fluxes it shows the same appearances as calx of lead. When mineralized by sulphur, lead easily liquefies, and, being gradually deprived of the volatile part, yields a distinct regulus, unless too much loaded with iron. It may be precipitated by iron and copper.

69
Mineralized by different substances.

70
Of copper.

A small piece of copper, either solid or foliated, sometimes communicates a ruby colour to fluxes, especially when assiled by tin or turbith mineral. If the copper be a little more or further calcined, it produces a green pellucid globule, the tinge of which grows weaker by cooling, and even verges towards a blue. By long fusion with borax, the colour is totally destroyed upon charcoal, but scarcely in the spoon. When once destroyed, this colour can scarcely be reproduced by nitre; but it remains fixed with microcosmic salt. If the calx or metal to be calcined be added in considerable quantity during fusion, it acquires an opaque red on cooling, though it appears green while pellucid and fused; but by a still larger quantity it contracts an opacity even while in fusion, and, upon cooling, a metallic splendor. Even when the quantity of copper is so small as scarcely to tinge the flux, a visible pellicle is precipitated upon a piece of polished iron added to it during strong fusion, and the globule in its turn takes the colour of polished iron; and in this way the smallest portions of copper may be discovered. The globule made green by copper, when fused in the spoon with a small portion of tin, yields a spherule of the latter mixed with copper, very hard and brittle: in this case the precipitated metal pervades the whole of the mass, and does not adhere to the surface. Cobalt precipitates the calx of copper dissolved in the spoon by a flux, in a metallic form, and imparts its own colour to glass, which nickel cannot do. Zinc also precipitates it separately, and rarely upon its own surface, as we can scarcely avoid melting it. When mineralized by the aerial acid, copper grows black on the first contact of the flame, and melts in the spoon; on the charcoal, the lower part, which touches the support, is reduced. With a superabundance of marine acid, it tinges the flame of a beautiful colour; but with a small quantity shows no appearance of the metal in that way. Thus the beautiful crystals of Saxony, which are cubic, and of a deep green, do not tinge the flame, though they impart a pellucid greenness to microcosmic salt. An opaque redness is easily obtained with borax; but Mr Bergman could not produce this colour with microcosmic salt. Copper

N^o 49.

Blow-pipe. simply sulphurated, when cautiously and gently roasted by the exterior flame, yields at last, by fusion, a regulus surrounded with a sulphurated crust. The mass roasted with borax separates the regulus more quickly.

If a small quantity of iron happens to be present, the piece to be examined must first be roasted; after which it must be dissolved in borax, and tin added to precipitate the copper. The regulus may also be obtained by sufficient calcination and fusion, even without any precipitant, unless the ore be very poor. When the pyrites contain copper, even in the quantity of the one-hundredth part of their weight, its presence may be detected by these experiments: Let a grain of pyrites, of the size of a flax-seed, be roasted, but not so much as to expel all the sulphur; let it then be dissolved by borax, a polished rod of iron added, and the fusion continued until the surface when cooled loses all splendor. As much borax is required as will make the whole of the size of a grain of hemp-seed. Slow fusion is injurious, and the precipitation is also retarded by too great tenuity; but this may be corrected by the addition of a little lime. Too much calcination is also inconvenient; for by this the globule forms slowly, is somewhat spread, becomes knotty when warm, corrodes the charcoal, destroys the iron, and the copper does not precipitate distinctly. This defect is corrected by a small portion of crude ore. When the globule is properly melted, according to the directions already given, it ought to be thrown into cold water immediately on stopping the blast, in order to break it suddenly. If the copper contained in it be less than one-hundredth part, one end of the wire only has a cupreous appearance, but otherwise the whole.

Dr Gahn has another method of examining the ores of copper; namely, by exposing a grain of the ore, well freed from sulphur by calcination, to the action of the flame driven suddenly upon it by intervals. At those instants a cupreous splendor appears on the surface, which otherwise is black; and this splendor is more quickly produced in proportion as the ore is poorer. The flame is tinged green by cupreous pyrites on roasting.

Forged iron is calcined, but can scarcely be melted; and liquefies on being fused. It cannot be melted by borax, though it may by microcosmic salt; and then it becomes brittle. Calcined iron becomes magnetic by being heated on the charcoal, but melts in the spoon. The fluxes become green by this metal; but in proportion as the phlogiston is more deficient they grow more of a brownish yellow. On cooling, the tinge is much weakened; and, when originally weak, vanishes entirely. By too much saturation the globe becomes black and opaque. The sulphureous pyrites may be collected into a globule by fusion, and is first surrounded by a blue flame; but as the metal is easily calcined, and changes into black scoriae, neither by itself nor with fluxes does it exhibit a regulus. It grows red on roasting.

Tin easily melts before the blow-pipe, and is calcined. The fluxes dissolve the calx sparingly; and, when saturated, contract a milky opacity. Some small particles of this metal dissolved in any flux may be distinctly precipitated upon iron. Crystallized ore of tin, urged by fire upon the charcoal, yields its metal in a reguline state.

Bismuth

71
Mineralized.

72
Gahn's method of examining the ores of copper.

73
Of iron.

74
Of tin.

75
Bismuth.
ow-pipe.
Bismuth presents nearly the same appearance as lead; the calx is reduced on the coal, and fused in the spoon. The calx, dissolved in microcosmic salt, yields a brownish yellow globule, which grows more pale upon cooling, at the same time losing some of its transparency. Too much calx renders the matter perfectly opaque. Borax produces a similar mass in the spoon; but on the coal a grey one, which can scarcely be freed from bubbles. On fusion the glass smokes and forms a cloud about it. Bismuth is easily precipitated by copper and iron.

76
Sulphurated
bismuth.
combined
with sul-
phur.
Sulphurated bismuth is easily fused, exhibiting a blue flame and sulphurous smell. Cobalt, when added, by means of the sulphur, enters the globule; but the scoria soon swells into distinct partitions; which when further urged by fire, throws out globules of bismuth. Sulphurated bismuth, by the addition of borax, may be distinctly precipitated by iron or manganese.

77
Nickel.
Regulus of nickel when melted is calcined, but more slowly than other metals. The calx imports an hyacinthine colour to fluxes, which grows yellow on cooling, and by long continued fire may be destroyed. If the calx of nickel be contaminated by ochre of iron, the latter is first dissolved. Nickel dissolved is precipitated on iron, or even on copper; an evident proof that it does not originate from either of these metals. Sulphurated nickel is nowhere found without iron and arsenic: the regulus is obtained by roasting, and fusing with borax, though it still remains mixed with some other metals.

78
Arsenic.
Regulus of arsenic takes fire by a sudden heat, and not only deposits a white smoke on charcoal, but diffuses the same all around. The calx smokes with a smell of garlic, but does not burn. The fluxes grow yellow, without growing opaque, on adding a proper quantity of calx, which is dispelled by a long continuance of the heat. This semimetal is precipitated in a metallic form by iron and copper, but not by gold. Yellow arsenic liquefies, smokes, and totally evaporates: when heated by the external flame, so as neither to liquefy nor smoke, it grows red and yellow again upon cooling. When it only begins to melt it acquires a red colour, which remains after cooling. Realgar liquefies more easily, and is besides totally dissipated.

79
Cobalt.
Regulus of cobalt melts, and may partly be depurated by borax, as the iron is first calcined and taken up. The smallest portion of the calx tinges the flux of a deep blue colour, which appears of a violet by refraction, and this colour is very fixed in the fire. Cobalt is precipitated upon iron from the blue globule, but not upon copper. When calx of iron is mixed with that of cobalt in a flux, the former is dissolved. This semimetal takes up about one third of its weight of sulphur in fusion, after which it can hardly be melted again. It is precipitated by iron, copper, and several other metals. The common ore yields an impure regulus by roasting. The green cobalt, examined by our author, tinges the microcosmic salt blue; but at the same time shows red spots indicating copper.

80
Zinc.
Zinc exposed to the blow-pipe melts, takes fire, sending forth a beautiful bluish green flame, which however is soon extinguished by a languid calx; but if the reguline nucleus included in this languid matter (commonly called flowers of zinc) be urged by the flame, it will be now and then inflamed, and as it were

explodes and flies about. With borax it froths, and at first tinges the flame. It continually diminishes, and the flux spreads upon the charcoal; but in fused microcosmic salt it not only froths, but sends forth flashes with a crackling noise. Too great heat makes it explode with the emission of ignited particles. The white calx, or flowers, exposed to the flame on charcoal, becomes yellowish, and has a kind of splendor, which vanishes when the flame ceases. It remains fixed, and cannot be melted. The fluxes are scarcely tinged; but when saturated by fusion, grow opaque and white on cooling. Clouds are formed round the globules of a nature similar to that of the metallic calx. Dissolved zinc is not precipitated by any other metal. When mineralized by aerial acid, it has the same properties as calcined zinc. In the pseudo-galenia sulphur and iron are present. These generally, on the charcoal, smelt, and tinge the flame more or less, depositing a cloud all around. Those which have no matrix are tinged by those which contain iron, and acquire by saturation a white opaque colour, verging to brown or black, according to the variety of composition.

Regulus of antimony fused and ignited on the charcoal, affords a beautiful object; for if the blast of air be suddenly stopped, a thick white smoke rises perpendicularly, while the lower part round the globule is condensed into crystalline spicula, similar to those called *Argentine flowers*. The calx tinges fluxes of an hyacinthine colour; but on fusion smokes, and is easily dissipated, especially on the charcoal, though it also deposits a cloud on it. The dissolved metal may be precipitated by iron and copper, but not by gold. Crude antimony liquefies on the charcoal, spreads, smokes, penetrates it, and at last disappears entirely except a ring which it leaves behind.

Regulus of manganese scarcely yields to the flame. The black calx tinges the fluxes of a bluish colour; borax, unless saturated, communicates more of a yellow colour. The colour may be gradually dissolved altogether by the interior flame, and again reproduced by a small particle of nitre, or the exterior flame alone. Combined with aerial acid, it is of a white colour, which changes by ignition to black. In other respects it shows the same experiments as the black calx.

BLOWING, in a general sense, denotes an agitation of the air, whether performed with a pair of bellows, the mouth, a tube, or the like. Butchers have a practice of blowing up veal, especially the loins, as soon as killed, with a pipe made of a sheep's flank, to make it look larger and fairer.

Blowing of Glass, one of the methods of forming the various kinds of works in the glass manufacture. It is performed by dipping the point of an iron blowing pipe in the melted glass, and blowing through it with the mouth, according to the circumstances of the glass to be blown. See **GLASS**.

Blowing of Tin, denotes the melting its ore, after being first burnt to destroy the mundic.

Machines for blowing the air into Furnaces. See the article **FURNACE**.

BLOWING, among gardeners, denotes the action of flowers, whereby they open and display their leaves. In which sense, blowing amounts to much the same with flowering or blossoming.

Flower,
Bluc.

The regular blowing season is in the spring; though some plants have other extraordinary times and manners of blowing, as the Glassbury thorn. Divers flowers also, as the tulip, close every evening, and blow again in the morning. Annual plants blow sooner or later as their seeds are put in the ground; whence the curious in gardening sow some every month in summer, to have a constant succession of flowers. The blowing of roses may be retarded by shearing off the buds as they put forth.

BLUBBER, denotes the fat of whales and other large sea-animals, whereof is made train-oil. It is properly the *aaps* of the animal: it lies immediately under the skin, and over the muscular flesh. In the porpoise it is firm and full of fibres, and invests the body about an inch thick. In the whale, its thickness is ordinarily six inches; but about the under lip, it is found two or three feet thick. The whole quantity yielded by one of these animals ordinarily amounts to 40 or 50, sometimes to 80 or more, hundred weight. The use of blubber to the animal seems to be partly to poise the body, and render it equiponderant to the water; partly to keep off the water at some distance from the blood, the immediate contact whereof would be apt to chill it; and partly also for the same use that clothes serve us, to keep the fish warm, by reflecting or reverberating the hot streams of the body; and so redoubling the heat; since all fat bodies are, by experience, found less sensible of the impressions of cold than lean ones. Its use in trade and manufactures is to furnish train-oil, which it does by boiling down. Formerly this was performed ashore, in the country where the whales were caught: but of late the fishers do not go ashore; they bring the blubber home stowed in casks, and boil it down here.

Sea-Blubber. See *MEDUSA*.

BLUE, one of the seven colours into which the rays of light divide themselves when refracted through a glass prism.—For an account of the particular structure of bodies by which they appear of a blue colour, see the article *CHROMATICS*.—The principal blues used in painting are Prussian blue, bice, Saunders blue, azure, or smalt, verditer, &c.: for the preparation of which, see *COLOUR-Making*.—In dyeing, the principal ingredients for giving a blue colour, are indigo and woad. See *DYEING*.

Blue Colour of the Sky. See *SKY*.

Blue Bird. See *MOTACILLA*.

Blue Fish. See *CORYTHENA*.

Blue Japan. Take gum-water, what quantity you please, and white-lead a sufficient quantity; grind them well upon a porphyry: then take singlass size what quantity you please, of the finest and best smalt a sufficient quantity; mix them well: to which add, of your white-lead, before ground, so much as may give it a sufficient body. Mix all these together to the consistence of a paint.

Blue-John, among miners, a kind of mineral which has lately been fabricated into vases and other ornamental figures. It is of the same quality with the cubical spar, with respect to its fusibility in the fire. It loses its colour, and becomes white in a moderate heat: the weight of a cubic foot of the bluest kind is 3180 ounces, and that of the least blue is 3140 ounces. This substance began first to be applied to use about 18

years ago at one of the oldest mines in Derbyshire, called *Ouin mine*, probably from its being dedicated to Odin the great god of the northern nations, at the foot of a high mountain called *Mam-Tor* in Cattleton. Here the greatest quantities are still found; the largest pieces are sold for 9l. a ton, the middle-sized for 6l. and the least for 50s.

Præpar. Blue. See *CHEMISTRY-Index*.

BLUING, the act or art of communicating a blue colour to bodies otherwise destitute thereof. Landresses blue their linen with smalt; dyers their stuffs and wools with woad or indigo.

Bluing of Metals is performed by heating them in the fire, till they assume a blue colour; particularly practised by gilders, who blue their metals before they apply the gold and silver leaf.

Bluing of Iron, a method of beautifying that metal sometimes practised; as for mourning buckles, swords, and the like. The manner is thus: Take a piece of grind-stone or whet-stone, and rub hard on the work, to take off the black scurf from it: then heat it in the fire; and as it grows hot, the colour changes by degrees, coming first to light, then to a darker gold colour, and lastly to a blue. Sometimes also they grind indigo and salad-oil together; and rub the mixture on the work with a woollen rag, while it is heating, leaving it to cool of itself. Among sculptors we also find mention of bluing a figure of bronze, by which it is meant the heating of it, to prepare it for the application of gold-leaf, because of the bluish cast it acquires in the operation.

BLUFF-HEAD, among sailors. A ship is said to be bluff-headed that has an upright stern.

BLUNDERBUSS, a short fire-arm with a wide bore, capable of holding a number of bullets at once.

BLUSHING, a suffusion or redness of the cheeks, excited by a sense of shame, on account of consciousness of some failing or imperfection.

Blushing is supposed to be produced from a kind of consent or sympathy between several parts of the body, occasioned by the same nerve being extended to them all. Thus the fifth pair of nerves being branched from the brain to the eye, ear, muscles of the lips, cheeks, palate, tongue, and nose; a thing seen or heard that is shameful, affects the cheeks with blushes, driving the blood into the minute vessels thereof, at the same time that it affects the eye and ear. For the same reason it is, as Mr Denham observes, that a favourable thing seen or smelt affects the glands and parts of the mouth: if a thing heard be pleasing, it affects the muscles of the face with laughter; if melancholy, it exerts itself on the glands of the eyes, and occasions weeping, &c. And to the same cause Dr Willis ascribes the pleasure of kissing.

BOA, or *BOAE-arum*, (anc. geog.), an island on the coast of Illyricum, over against Tragurium. A place of banishment for condemned persons; now called *Buz*, an island in the Adriatic, joined to the continent and to Tragurium, now *Tran*, by a bridge.

BOA, in zoology, a genus of serpents, belonging to the order of amphibia. The characters of this genus are, that the belly and tail are both furnished with scuta. The species are ten, *viz.* 1. The contortrix, has 150 scuta on the belly, and 40 on the tail: the head is broad, very convex, and has poison-bags in the

Bluing
||
Boa.

the mouth, but no fang, for which reason its bite is not reckoned poisonous: the body is ash-coloured, interspersed with large dusky spots; and the tail is about a third of the length of the body. This serpent is found in Carolina. 2. The canina, has 203 scuta on the belly, and 77 on the tail; it is greenish, and variegated with white belts. It is a native of America, and lodges in the hollow trunks of trees, and is about two feet long. The bite of the canina is not poisonous. 3. The hignale is of a dull yellow colour, and is found in Asia. It has 179 scuta on the belly, and 120 on the tail. 4. The constrictor, has 240 scuta on the belly, and 60 on the tail. This is an immense animal: it often exceeds 36 feet in length; the body is very thick, of a dusky white colour, and its back is interspersed with 24 large pale irregular spots; the tail is of a darker colour; and the sides are beautifully variegated with pale spots. Besides, the whole body is interspersed with small brown spots. The head is covered with small scales, and has no broad laminae betwixt the eyes, but has a black belt behind the eyes. It wants the large dog-fangs, and of course its bite is not poisonous. The tongue is fleshy, and very little forked. Above the eyes, on each side, the head rises high. The scales of this serpent are all very small, roundish, and smooth. The tail does not exceed one eighth of the whole length of the animal. The Indians, who adore this monstrous animal, use the skin for cloaths, on account of its smoothness and beauty. There are several of these skins of the above dimensions preserved, and to be seen in the different museums of Europe, particularly in the library and botanic garden of Upsal in Sweden, which has of late been greatly enriched by count Grillinborg. The flesh of this serpent is eat by the Indians and the negroes of Africa. Pilo, Margraave, and Kempfer, give the following account of its method of living and catching its prey. It frequents caves and thick forests, where it conceals itself, and suddenly darts out upon strangers, wild beasts, &c. When it chooses a tree for its watching place, it supports itself by twirling its tail round the trunk or a branch, and darts down upon sheep, goats, tigers, or any animal that comes within its reach. When it lays hold of animals, especially any of the larger kinds, it twirls itself several times round their body, and by the vail force of its circular muscles bruises and breaks all their bones. After the bones are broke, it licks the skin of the animal all over, besmearing it with a glutinous kind of saliva. This operation is intended to facilitate deglutition, and is a preparation for swallowing the whole animal. If it be a stag, or any horned animal, it begins to swallow the feet first, and gradually sucks in the body, and last of all the head. When the horns happen to be large, this serpent has been observed to go about for a long time with the horns of a stag sticking out from its mouth. As the animal digests, the horns putrify and fall off. After this serpent has swallowed a stag or a tiger, it is unable for some days to move; the hunters, who are well acquainted with this circumstance, always take this opportunity of destroying it. When irritated, it makes a loud hissing noise. This serpent is said to cover itself over with leaves in such places as stags or other animals frequent, in order to conceal itself from their sight, and that it may the more easily lay hold of them. 5. The murina, has 254

scuta on the belly, and 65 on the tail. The colour of it is a light blue, with round spots on the back. It is a native of America, and its bite is not poisonous. 6. The feytale, has 250 scuta on the belly, and 70 on the tail. The body is ash-coloured and bluish, with round black spots on the back, and black lateral rings edged with white. This serpent is a native of America; and, like the constrictor, though not so long, twirls itself about sheep, goats, &c. and swallows them whole. 7. The cendria, has 265 scuta on the belly, and 57 on the tail. It is of a yellow colour, with white eye-like spots. It is a native of Surinam, and its bite is not poisonous. 8. The ophiias, has 281 scuta on the belly, and 64 on the tail; the colour is nearly the same with that of the constrictor, but browner. The place where this serpent is to be found is not known; but its bite is not venomous. 9. The enydris, has 270 scuta on the belly, and 105 on the tail. The colour is a dusky white, and the teeth of the lower jaw are very long; but its bite is not poisonous. It is a native of America. 10. The kortulana, has 290 scuta on the belly, and 128 on the tail. It is of a pale colour, interspersed with livid wedge-like spots. It is a native of America, and its bite is not poisonous. See SERPENT.

BOADADA BASHEE, in the Turkish military orders, an officer of the janizaries, whose business it is to walk every day about the principal parts of the city, with a number of janizaries to attend him, to keep order, and see that all things are regular, even to the dress. This office is for three months, and from this the person is usually advanced to be a serach.

BOADICEA, a valiant British queen in the time of Nero the emperor, wife to Prasutagus king of the Iceni in Britain, who by his will left the emperor and his own daughters co-heirs to his great treasures, in expectation of procuring by that means Nero's protection for his family and people: but he was no sooner dead, than the emperor's officers seized all. Boadicea opposed these unjust proceedings; which was resented to such a pitch of brutality, that they ordered the lady to be publicly whipped, and her daughters to be ravished by the soldiers. The Britons took arms, with Boadicea at their head, to shake off the Roman yoke; and made a general and bloody massacre of the Romans in all parts. The whole province of Britain would have been lost, if Suetonius Paulinus had not hastened from the isle of Mona to London, and with 10,000 men engaged the Britons. The battle was fought for a long time with great vigour and doubtful success, till at last victory inclined to the Romans. Boadicea, who had behaved with all bravery imaginable, dispatched herself by poison.

BOAR, in the manege. A horse is said to boar when he shoots out his nose as high as his ears, and tosses his nose in the wind.

BOAR, a male swine. See SUS.

The wild boar, among huntsmen, has several names, according to its different ages: the first year, it is called a pig of the jaunter; the second it is called a hog; the third, a log-fler; and the fourth, a bar; when leaving the jaunter, he is called a singler or jangler. The boar generally lives to 25 or 30 years, if he escape accidents. The time of going to rut is in December, and lasts about three weeks. They feed on all sorts of

Boar.

fruits, and on the roots of many plants; the root of fern in particular seems a great favourite with them; and when they frequent places near the sea coasts, they will descend to the shores and demolish the tenderer shell-fish in very great numbers. Their general places of rest are among the thickest bushes that can be found: and they are not easily put up out of them, but will stand the bay a long time. In April and May they sleep more sound than at any other time of the year, and this is therefore the successful time for the taking them in the toils. When a boar is roused out of the thicket, he always goes from it, if possible, the same way by which he came to it; and when he is once up, he will never stop till he comes to some place of more security. If it happens that a saunder of them are found together, when any one breaks away, the rest all follow the same way. When the boar is hunted in the wood where he was bred, he will scarce ever be brought to quit it; he will sometimes make towards the sides to listen to the noise of the dogs, but retires into the middle again, and usually dies or escapes there. When it happens that a boar runs a-head, he will not be stopped or put out of his way, by man or beast, so long as he has any strength left. He makes no doubles nor crossings when chased; and when killed makes no noise, if an old boar; the fows and pigs will squeak when wounded.

The season for hunting the wild boar begins in September, and ends in December, when they go to rut. If it be a large boar, and one that has lain long at rest, he must be hunted with a great number of dogs, and those such as will keep close to him; and the huntsman, with his spear, should always be riding in among them, and charging the boar as often as he can, to discourage him: such a boar as this, with five or six couple of dogs, will run to the first convenient place of shelter, and there stand at bay and make at them as they attempt to come up with him. There ought always to be relays also set of the best and staunchest hounds in the kennel; for if they are of young eager dogs, they will be apt to seize him, and be killed or spoiled before the rest come up. The putting collars with bells about the dogs necks is a great security for them; for the boar will not so soon strike at them when they have these, but will rather run before them. The huntsmen generally kill the boar with their swords or spears; but great caution is necessary in making the blows; for he is very apt to catch them upon his snout or tusks; and if wounded and not killed, he will attack the huntsman in the most furious manner. The places to give the wound with the spear is either between the eyes in the middle of the forehead, or in the shoulder; both these places make the wound mortal.

When this creature makes at the hunter, there is nothing for it but courage and address; if he flies for it, he is surely overtaken and killed. If the boar comes straight up, he is to be received at the point of the spear: but if he makes doubles and windings, he is to be watched very cautiously, for he will attempt getting hold of the spear in his mouth; and if he does so, nothing can save the huntsman but another person attacking him behind: he will on this attack the second person, and the first must then attack him again: two people will thus have enough to do with him; and were

it not for the forks of the boar-spears that make it impossible to press forward upon them, the huntsman who gives the creature his death's wound would seldom escape falling a sacrifice to his revenge for it. The modern way of boar-hunting is generally to dispatch the creature by all the huntsmen striking him at once: but the ancient Roman way was, for a person on foot, armed with a spear, to keep the creature at bay; and in this case the boar would run of himself upon the spear to come at the huntsman, and push forward till the spear pierced him through.

The hinder claws of a boar are called *guards*. In the corn, he is said to *feed*; in the meadows or fallow-fields, to *root, worm, or sow*; in a close, to *graze*. The boar is farrowed with as many teeth as he will ever have; his teeth increasing only in bigness, not in number: among these there are four called *tushes*, or *tusks*; the two biggest of which do not hurt when he strikes, but serve only to whet the other two lowest, with which the beast defends himself, and frequently kills, as being greater and longer than the rest.

It is very remarkable, that these creatures in the West Indies are subject to the stone: few of them are absolutely free from it, yet scarce any have the stones of any considerable size. It is common to find a great number in the same bladder; and they are usually of about a scruple weight, and are angular, and that with great regularity, each having five angles.

Among the ancient Romans, boar's flesh was a delicacy; a boar served up whole was a dish of state.

The boar was sometimes also the military ensign borne by the Roman armies, in lieu of the eagle.

Among physicians, a boar's bladder has been reputed a specific for the epilepsy. The tush of the wild boar still passes with some as of great efficacy in quinzies and pleurisies.

BOARD, a long piece of timber, sawed thin for building and several other purposes. See TIMBER.

Deal-boards are generally imported into England ready sawed, because done cheaper abroad, in regard we want saw-mills. Cap boards are imported from Sweden and Dantzic. Oak-boards chiefly from Sweden and Holland; some from Dantzic. We also import white boards for shoemakers; mill and scale-boards, &c. for divers artificers. Scale-board is a thinner sort, used for the covers of primers, thin boxes, and the like. It is made with large planes; but might probably be sawed with mills to advantage.

BOARD is also used for a kind of table or bench, whereon several artificers perform their work. In this sense, we say a *work-board*, *shop-board*, *taylor's-board*, &c.

BOARD is also used for a flat machine, or *frame*, used in certain games, and the like. In this sense, we say a draught-board, a chess-board, a shovel-board, and the like.

BOARD, *Bureau*, is also used for an office where accounts are taken, payments ordered, and the like. In this sense, we say the *board* of works, *board* of ordnance, *board* of treasury, and the like.

BOARD, among seamen. *To go aboard*, signifies to go into the ship. *To slip by the board*, is to slip down by the ship's side. *Board and board*, is when two ships come so near as to touch one another, or when they lie side by side. *To make a board*, is to turn to windward;

Boar,
Board.

Fig. 3 BOS sp. 2.

Fig. 1. BOA Constrictor.

J. Bell Sculp^t

Boarding, ward; and the longer your boards are, the more you work into the wind. *To board it up.* is to beat it up, sometimes upon one tack and sometimes upon another. *She makes a good board,* that is, the ship advances much at one tack. *The weather-board,* is that side of the ship which is to windward.

BOARDING, in a naval engagement, a desperate and furious assault made by one ship on another, after having found every other method to reduce her ineffectual: it may be performed in different places of the ship, according to their circumstances and situation, by the assailant detaching a number of men armed with pistols and cutlasses on the decks of his antagonist, who stands in the same predicament with a city stormed by the besiegers. This expedient, however, is rarely attempted by king's ships, which generally decide the combat without grappling each other; but chiefly practised by privateers, which, bearing down on the enemy's quarter or broadside, drop from the bowsprit, which projects over the defendant's deck, an earthen shell, called a *sink-pan*, charged with fiery and suffocating combustibles, which immediately bursts, catches fire, and fills the deck with insufferable stench and smoke: in the middle of the confusion thus occasioned, the privateer's crew rush aboard, under cover of the smoke, and easily overpower the astonished enemy, unless they have close quarters to which they can retreat and beat them off the deck.

BOAT, a small open vessel, conducted on the water by rowing or sailing. The construction, machinery, and even the names of boats, are very different, according to the various purposes for which they are calculated, and the services on which they are to be employed. Thus they are occasionally slight or strong, sharp or flat bottomed, open or decked, plain or ornamented; as they may be designed for swiftness or burden, for deep or shallow water, for sailing in a harbour or at sea, and for convenience or pleasure.

The largest boat that usually accompanies a ship is the *long-boat*, which is generally furnished with a mast and sails: those which are fitted for men of war, may be occasionally decked, armed, and equipped, for cruising short distances against merchant-ships of the enemy, or smugglers, or for impressing seamen, &c. The *barges* are next in order, which are longer, slighter, and narrower: they are employed to carry the principal sea-officers, as admirals, and captains of ships of war, and are very unfit for sea. *Pinnaces* exactly resemble barges, only that they are somewhat smaller, and never row more than eight oars; whereas a barge properly never rows less than ten. These are for the accommodation of the lieutenants, &c. *Cutters* of a ship, are broader, deeper, and shorter, than the barges and pinnaces; they are fitter for sailing, and are commonly employed in carrying stores, provisions, passengers, &c. to and from the ship. In the structure of this sort of boats, the lower edge of every plank in the side overlaps the upper edge of the plank below, which is called by ship-wrights *chink-work*. *Tarrows* are something less than cutters, nearly of the same form, and used for similar services; they are generally rowed with six oars.

The above boats more particularly belong to men of war; as merchant-ships seldom have more than two, viz. a long-boat and yawl: when they have a third, it

is generally calculated for the countries to which they trade, and varies in its construction accordingly. Merchant-ships employed in the Mediterranean find it more convenient to use a *lanch*, which is longer, more flat-bottomed, and better adapted every way to the harbours of that sea, than a long-boat.

A *wherry* is a light sharp boat, used in a river or harbour for carrying passengers from place to place. *Parts* are a sort of oblong flat-bottomed boats, nearly resembling floating stages; they are used by ship-wrights and caulkers, for breaming, caulking, or repairing a ship's bottom. A *rufes* is a very flat broad boat, used by merchant-ships amongst the Caribbee-islands, to bring hogheads of sugar off from the sea-beach to the shipping which are anchored in the roads. A *felucca* is a strong passage-boat used in the Mediterranean, from 10 to 16 banks of oars. The natives of Barbary often employ boats of this sort as cruizers.

For the larger sort of boats, see the articles CRAFT, CUTTER, PERIAGUA, and SHALLOP.

Of all the small boats, a *Norway yawl* seems to be the best calculated for a high sea, as it will often venture out to a great distance from the coast of that country, when a stout ship can hardly carry any sail.

An account of several trials made on a BOAT, or Skiff, fit for inland navigation, coasting voyages, and short passages by sea, which is not, like ordinary vessels, liable to be overjet or sunk by winds, waves, water-spouts, or too heavy a load; contrived and constructed by Monsieur Bernieres, director of the bridges and causeways in France, &c. &c. Some of these trials were made on the first of August 1777, at the gate of the invalids in Paris, in the presence of the provost of the merchants, of the body of the town, and a numerous concourse of spectators of all conditions.

The experiments were made in the way of comparison with another common boat of the same place, and of equal size. Both boats had been built ten years, and their exterior forms appeared to be exactly similar. The common boat contained only eight men, who rocked it and made it incline so much to one side, that it presently filled with water, and sunk; so that the men were obliged to save themselves by swimming; a thing common in all vessels of the same kind, either from the imprudence of those who are in them, the strength of the waves or wind, a violent or unexpected shock, their being overloaded, or overpowered in any other way.

The same men who had just escaped from the boat which sunk, got into the boat of M. Bernieres; rocked it, and filled it, as they had done the other, with water. But, instead of sinking to the bottom, though brim full, it bore being rowed about the river, loaded as it was with men and water, without any danger to the people in it.

M. Bernieres carried the trial still further. He ordered a mast to be erected in this same boat, when filled with water; and to the top of the mast had a rope fastened, and drawn till the end of the mast touched the surface of the river, so that the boat was entirely on one side, a position into which neither winds nor waves could bring her: yet, as soon as the men who had hauled her into this situation let go the rope, the boat and mast recovered themselves perfectly in less than the quarter of a second; a convincing proof that the boat

Boating
||
Bobbing

could neither be sunk nor overturned, and that it afforded the greatest possible security in every way. These experiments appeared to give the greater pleasure to the public, as the advantages of the discovery are not only so sensible, but of the first importance to mankind.

Boat-Pill. See CANCROMA.

Boat-Inf. See NOZONECTA.

BOATING, a kind of punishment in use among the ancient Persians for capital offenders. The manner of boating was thus: the person condemned to it being laid on his back in a boat, and having his hands stretched out, and tied fast on each side of it, had another boat put over him, his head being left out thro' a place fit for it. In this posture they fed him, till the worms, which were bred in the excrements he voided as he thus lay, eat out his bowels, and so caused his death, which was usually twenty days in effecting, the criminal lying all this while in most exquisite torments.

BOATSWAIN, the officer who has the boats, sails, rigging, colours, anchors, and cables, committed to his charge.

It is the duty of the boatswain particularly to direct whatever relates to the rigging of a ship, after she is equipped from a royal dock-yard. Thus he is to observe that the masts are properly supported by their shrouds, stays, and back-stays, so that each of these ropes may sustain a proportional effort when the mast is strained by the violence of the wind, or the agitation of the ship. He ought also to take care that the blocks and running-ropes are regularly placed, so as to answer the purposes for which they are intended; and that the sails are properly fitted to their yards and flays, and well furled or reefed when occasion requires.

It is likewise his office to summon the crew to their duty; to assist with his mates in the necessary business of the ship; and to relieve the watch when it expires. He ought frequently to examine the condition of the masts, sails, and rigging; and remove whatever may be judged unfit for service, or supply what is deficient; and he is ordered by his instructions to perform this duty with as little noise as possible.

Boatswain's-Mate has the peculiar command of the long-boat, for the setting forth of anchors, weighing or fetching home an anchor, warping, towing, or mooring; and is to give an account of his store.

BOB, a term used for the ball of a short pendulum.

BOBARTIA, in botany, a genus of the digynia order, belonging to the triandria class of plants; and in the natural method ranking under the 4th order, *Gramina*. The calyx is imbricated; and the corolla is a bivalve glume, above the receptacle of the fruit. Of this genus there is only one species known, which is a native of the Indies, and hath no remarkable property.

BOBBIN, a small piece of wood turned in the form of a cylinder, with a little border jutting out at each end, bored through to receive a small iron pivot. It serves to spin with the spinning-wheel, or to wind thread, worsted, hair, cotton, silk, gold, and silver.

BOBBING, among fishermen, a particular manner of catching eels, different from snigging. Bobbing for eels is thus performed: They scoop well some large lobs, and with a needle run a twiled silk through them from end to end, taking so many as that they may wrap them about a board a dozen times at least: then they

tie them fast with the two ends of the silk, that they may hang in so many lanks; which done, they fasten all to a strong cord, and, about an handful and an half above the worms, fix a plummet three-quarters of a pound weight, and make the cord fast to a strong pole. With this apparatus fishing in muddy water, they feel the eels tug lustily at the bait; when they think they have swallowed it sufficiently, they gently draw up the rope to the top, and bring them ashore.

BOBIO, an episcopal town of Italy, in the Milanese and territory of Pavia, seated on the river Treba, in E. Long. 9. 30. N. Lat. 44. 48.

BOCA-ERICA, the strait or entrance into the harbour of Carthage in South America. It is defended by several forts belonging to the Spaniards, all which were taken by the English in 1741; they were nevertheless obliged to raise the siege of Carthage in a short time after.

Boca-del-Drago, a strait so called, between the island of Trinidad and Andalusia, in the province of Terra Firma in South America.

BOCANUM, (anc. geog.), a town of Mauritania Tingetana, to the south of mount Atlas; said to be that of Morocco in Africa. W. Long. 9. 0. N. Lat. 31. 0.

BOCCA, in glass-making, the round hole in the working furnace, by which the metal is taken out of the great pots, and by which the pots are put into the furnace. This is to be stopped with a cover made of earth and brick, and removable at pleasure, to preserve the eyes of the workmen from the violence of the heat.

BOCCACE (John), one of the most polite and learned writers of his age, was born in Tuscany in 1313. His father first placed him with a merchant; but as he gave signs of genius, he was put afterward to study the canon law: he lost almost as much time at this as at the last occupation; and thought of nothing but poetry. He came under the instruction of Petrarch; but did not so entirely devote himself to poetry, as to forget other studies. In the prosecution of these, however, as he sought every where for the best masters, and had not an income sufficient for his expenses, he was reduced to such circumstances as to stand in need of the bounty of others: he was particularly obliged to Petrarch, who furnished him with money as well as books, and assisted him in many other respects. Boccace was a great admirer of the Greek language: he found means to get Homer translated into Latin for his own use; and procured a professor's chair at Florence for Leontius Pylatus, in order to explain this poet. The republic of Florence honoured Boccace with the freedom of that city; and employed him in public affairs, particularly to negotiate the return of Petrarch: but this poet not only refused to return to Florence, but persuaded Boccace also to retire from thence, on account of the factions which prevailed in that republic. Having quitted Florence, he went to several places in Italy, and stopped at last at the court of Naples, where King Robert gave him a very kind reception. He conceived a violent affection for the natural daughter of that prince, which made him remain a considerable time at Naples. He also made a long stay in Sicily, where he was in high favour with Queen Joan. He returned to Florence when the

Boccace

BOCCALE or **BOCAL**, a liquid measure used at Rome, answering to what among us is called a bottle, being equivalent to about an English quart. Seven boccales and an half make the rubbia.

BOCCALINI (Trajan), a celebrated satirical writer, born at Rome, who, in the beginning of the 17th century, obtained the admiration of all Italy by his refined and delicate criticisms. Sovereign princes themselves did not escape the lash of his satire. The cardinals Borghese and Gaetan having declared themselves his protectors, he published his *Ragguaglio di Parnaso*, and *La Secretaria di Apollo*, which is the continuation of the former. These two works were received by the public with uncommon applause. He there feigns, that Apollo, holding his court at Parnassus, heard the complaints of the whole world, and did justice according as the cases required. He at length printed his *Pietra di Paragono*; wherein he attacks the court of Spain, setting forth their designs against the liberty of Italy, and inveighing particularly against them for the tyranny they exercised in the kingdom of Naples. The Spaniards complained of him in form, and were determined at any rate to be revenged. Boccacini was frightened, and retired to Venice; but was there assassinated in a very strange manner. He lodged with one of his friends, who having got up early one morning, left Boccacini in bed; a minute after, some armed men entered his chamber, and gave him so many blows with bags full of sand, that they left him for dead; so that his friend returning some time after, found him speechless. Great search was made at Venice for the authors of this murder; and though they were never discovered, it was universally believed that they were employed by the court of Spain.

BOCCARELLA, in the glass-manufacture, a small hole or aperture of the furnace, one of which is placed on each side the bocca, almost horizontally with it. Out of them the fervitors take coloured or finer metal from the piling pot.

BOCCIARDI (Clemente), called *Clementino*, history and portrait painter, was born at Genoa in 1620, and was the disciple of Bernardo Strozzi, an artist of good reputation; but he found in himself so strong an ambition to arrive at excellence in his profession, that he left Genoa, and went to Rome; there, to explore that true sublimity of style, which can only be obtained by a judicious observation of the ancient sculptures and the works of the celebrated modern artists. By the guidance of an excellent genius, and also by a most industrious application to design, he discovered the art of uniting and blending the antique and modern gusto in a style that at once exhibited both gracefulness and strength. Most of the works of this master (except his portraits, which were lively, natural, and grace-

ful) are in the chapels of Genoa, Pisa, and other cities of Italy; of which places they are, at this day, accounted the greatest ornaments, and are most exceedingly esteemed.

BOCCONI (Sylvio), a celebrated natural historian, born at Palermo in Sicily. After he had gone through the usual course of studies, he applied himself chiefly to natural history, in which he made a most surprising progress. He was afterwards ordained priest, and entered into the Cistercian order, at which time he changed his christian name *Paul* into that of *Sylvio*. This new way of life did not in the least divert him from his favourite study: for he pursued it with greater vigour than ever, and travelled not only over Sicily, but likewise visited the isle of Malta, Italy, the Low Countries, England, France, Germany, Poland, and several other nations; and, in 1696, was admitted a member of the academy of the virtuosi in Germany. Upon his return to Sicily, he retired to a convent of his own order near Palermo; where he died in 1704, being 71 years of age. He left many curious works.

BOCCONIA, GREATER TREE CELANDINE: A genus of the monogynia order, belonging to the didecandria class of plants, and in the natural method ranking under the 27th order, *Rivales*. The calyx is diphyllous; there is no corolla; the stylus is bifid; the berry is dry, and monospermous. Of this genus there is but one known species, viz. the frutescens, which is esteemed for the beauty of its large foliage. It is very common in Jamaica and other warm parts of America, where it grows to the height of 10 or 12 feet, having a straight trunk as large as a man's arm, and covered with a white smooth bark. At the top it divides into several branches, on which the leaves are placed alternately. These leaves are eight or nine inches long, and five or six broad; are deeply sinuated, sometimes almost to the midrib; and are of a fine glaucous colour. The whole plant abounds with a yellow juice of an acrid nature; so that it is used by the inhabitants of America to take off warts and spots from the eyes. The singular beauty of this plant renders it worthy of a place in every curious collection; and it seems the Indians are very fond of it; for Hernandez tells us, their kings used to plant it in their gardens. It is propagated by seeds from America, sowing them in spring, in pots of light earth, which must be plunged in a hot-bed. When the plants come up, they are to be kept in separate pots, which must always be kept in a stove.

BOCHART (Samuel), one of the most learned men in the 17th century, was born at Roan in Normandy. He made a very early progress in learning, and became a great proficient in the oriental languages. He was many years pastor of a protestant church at Caen; where he was tutor to Wentworth Dillon earl of Roscommon, author of the Essay on Translated Verse. Here he particularly distinguished himself by his public disputations with father Veron, a very famous controversialist. The dispute was held in the castle of Caen, in the presence of a great number of Catholics and Protestants. Bochart came off with great honour and reputation; which were not a little increased in the year 1646, upon the publication of his *Phaleg* and *Canaan*, which are the titles of the two parts of his *Geographica Sacra*. He acquired also great fame by his *Hierozie n*, printed in London in 1675. This treats *de animalibus sacris*

Bocconi
Bochart.

Eschius

Bodin.

facra scripturae. The great learning he displayed in his works rendered him esteemed not only amongst those of his own profession, but amongst all lovers of knowledge of whatever denomination. In 1652, the queen of Sweden invited him to Stockholm, where she gave him many proofs of her regard and esteem. At his return to Caen, he resumed the functions of the ministry, and was received into the academy of that city. His learning was not his principal qualification, he had a modestly equal to it; and hence enjoyed his great reputation in tranquillity, sheltered from those unhappy quarrels which so many other learned men draw upon themselves. He died suddenly while he was speaking in the above academy, on the 16th of May, 1667, aged 78. A complete edition of his works was published in Holland, in two volumes folio, 1712.

BOCHIIUS, or BOCCOPI (John), a Latin poet, born at Brussels in 1555. He travelled into Italy, Germany, Poland, and Muscovy, and at his return became secretary to the Duke of Parma. He died on the 13th of January, 1609. The critics in the Netherlands set so great a value on his poetry, that they gave him the name of the *Belgic Virgil*. He wrote, 1. *De Belgii Principatu.* 2. *Parodia Heroica Psalmorum Davidicorum.* 3. *Observationes Physicæ, Ethicæ, Politicæ, et Historicæ in Psalmis.* 4. *Vita Davidis.* 5. *Orationes.* 6. *Pœmata.*

BOCHETTA, a place of Italy, famous in the war of 1746 and 1747. It is a chain of mountains over which the great road lies from Lombardy to Genoa; and on the very peak of the highest mountain is a narrow pass, which will hardly admit three men to go abreast. This pass is properly called the *Bochetta*; for the defence of which there are three forts. It is the key of the city of Genoa; and was taken in 1746 by the Imperialists. By which means they opened a way to that city.

BOCKHOLT, a town of Germany in the circle of Westphalia and diocese of Munster, capital of a small district, and subject to the bishop of Munster. E. Long. 6. 20. N. Lat. 51. 40.

BOCKING, a very large village of Essex in England, adjoining to Brain-tree, from which it is separated only by a small stream. Its church is a deanery, and very large; and there are here two or three meeting houses; but the market is kept at Brain-tree. In both parishes there are about 1500 houses, which in general are but indifferent, and the streets narrow and badly paved. There is a large manufactory of bays, chiefly for exportation. It is 42 miles north-east of London.

BOCK-LAND, in the Saxons time, is what we now call *freehold lands*, held by the better sort of persons by charter or deed in writing; by which name it was distinguished from *skilled*, or copyhold land, holden by the common people without writing.

BODERIA, or BODOTRIA, the ancient name for the Firth of Forth in Scotland.

BODIN (John), native of Angers, one of the ablest men in France in the 16th century, famous for his *Method of History*, his *Republic*, and other works. He was in great favour with Henry III. who imprisoned John de Serre for writing an injurious piece against Bodin, and forbid him upon pain of death to publish it. But his favour was not of long continuance. The

duke of Alençon, however, gave him several employments; and carried him to England with him as one of his counsellors, where he had the pleasure and glory to see his books *de Republica* read publicly in the university of Cambridge, having been translated into Latin by the English. He had written them in French. In the Ragguagli of Boccalini he is condemned as an atheist to the fire, for having said in his books that liberty of conscience ought to be granted to sectaries. He declared himself pretty freely against those who asserted that the authority of monarchs is unlimited; but yet he displeased the republicans. Upon the death of the duke of Alençon, Bodin retired to Laon, where he married. He had an office in the pretorial of this city; and in Charles IX.'s time he was the king's solicitor with a commission for the forests of Normandy. He died of the plague at Laon, in 1596.

BODKIN, a small instrument made of steel, bone, ivory, &c. used for making holes.

BODLEY (Sir Thomas), founder of the Bodleian library at Oxford, was born at Exeter in Devonshire, in 1544. When he was about 12 years of age, his father, Mr John Bodley, being a protestant, was obliged to leave the kingdom. He settled at Geneva with his family, and continued there till the death of Queen Mary. In that university, then in its infancy, young Bodley studied the learned languages, &c. under several eminent professors. On the accession of Queen Elizabeth, he returned with his father to England; and was soon after entered of Magdalen college in Oxford. In 1563, he took the degree of bachelor of arts, and the year following was admitted fellow of Merton college. In 1565, he read a Greek lecture in the hall of that college. He took a master of arts degree the year after, and read natural philosophy in the public schools. In 1569, he was one of the procurators of the university, and, for some time after, officiated as public orator. In the year 1576, he quitted Oxford, and made the tour of Europe; but returned to his college after four years absence. He became gentleman-usher to Queen Elizabeth, in the year 1583; and in 1585 he married the widow of Mr Ball, daughter of Mr Carew of Bristol, a lady of considerable fortune. Mr Bodley was soon after sent ambassador to the king of Denmark, and other German princes. He was next charged with an important commission to Henry III. of France; and in 1588, went ambassador to the United Provinces, where he continued till the year 1597. On his return to England, finding his preferment obstructed by the jarring interests of Burleigh and Essex, he retired from court, and could never afterwards be prevailed on to accept of any employment. He now began the foundation of the Bodleian library, which was completed in 1599. Soon after the accession of King James I. he received the honour of knighthood, and died in the year 1612. He was buried in the choir of Merton college. His monument is of black and white marble, on which stands his effigy in a scholar's gown, surrounded with books. At the four corners are the emblematical figures of Grammar, Rhetoric, Music, and Arithmetic; two angels, &c.; with a short inscription, signifying his age and time of his death. Sir Thomas Bodley was a polite scholar, an able statesman, and a worthy man. Mr Granger observes, that he merited much as a man of letters;

ters; but incomparably more in the ample provision he made for literature, in which he stands unrivalled; and that his library is a manuforium which will perpetuate his memory as long as books themselves endure. Sir Thomas wrote his own Life to the year 1609; which, together with the first draught of the Statutes, and his Letters, have been published from the originals in the Bodleian library, by Mr Thomas Hearne, in 1703.

BODMIN, a town of Cornwall in England, seated in a bottom between two high hills, which renders the air very unwholesome. It consists chiefly of one street, and the many decayed houses show that it has once been a place of greater note. It is a mayor-town, sends two members to parliament, and had formerly the privilege of the coinage of tin. W. Long. 4. 5. N. Lat. 50. 32.

BODON, a fortified town of Bulgaria in Turkey in Europe, with an archbishop's see. It is seated on the Danube, in E. Long. 45. 24. N. Lat. 45. 10.

BODROCH, a town of Hungary, seated on the north-east shore of the river Danube, in E. Long. 20. 20. N. Lat. 46. 15.

BODRUN. See **TROS**.

BODY, in physics, an extended solid substance, of itself utterly passive and inactive, indifferent either to motion or rest.

Colour of BODIES. See **CHROMATICS**.

BODY, with regard to animals, is used in opposition to soul, in which sense it makes the subject of anatomy. The height of the human body is said to be different in different parts of the day; ordinarily it is an inch more in the morning than at night †. The body ceases to grow in height when the bones are arrived at a degree of firmness and rigidity which will not allow of farther extension by the effort of the heart and motion of the blood.

Bony, among painters, as to *bear a body*, a term signifying that the colours are of such a nature, as to be capable of being ground so fine, and mixing with the oil so entirely, as to seem only a very thick oil of the same colour.

BODY, in the manege. A horse is chiefly said to have a *good body*, when he is full in the flank. If the last of the short ribs be at a considerable distance from the haunch-bone, although such horses may for a time have pretty good bodies, yet, if they are much laboured, they will lose them; and these are properly the horses that have no flank. It is also a general rule, that a man should not buy a light-bodied horse, and one that is fiery, because he will soon destroy himself.

BODY, in the art of war, a number of forces, horse and foot, united and marching under one commander.

Main Body of an army, the troops encamped in the centre between the two wings, and generally infantry; the other two bodies are the vanguard and the rear-guard; these being the three into which an army, ranged in order of battle, is divided.

BODY, in matters of literature, denotes much the same with system, being a collection of every thing belonging to a particular science or art, disposed in proper order: thus we say, a body of divinity, law, physic, &c.

Body-Corporate. See **CORPORATION**.

BOECE, or **BOETHIUS** (Hector), the historian, was

born at Dun-lee about the year 1475, and studied with applause in the university of Paris. It was there he became acquainted with Erasmus, and laid the foundation of a friendship which was so honourable to him. In 1500 he was recalled to Aberdeen by Bishop Elphingilston, who made him principal of that university. Gratitude for this promotion engaged him to write with particular attention the Life of that prelate. It appeared in his history of the diocese of Aberdeen; and may be considered, perhaps, as the most valuable portion of that work. His History of Scotland, a more useful undertaking, was first published in the 1526. In 1574 it underwent a second impression, and was enriched with the 18th book and a part of the 19th. A farther continuation of it was executed by Joannes Ferrerius Pedemontanus. Boece died about the year 1550. He has been compared, and not without reason, to Geoffroy of Monmouth. He had a propensity to fable and exaggeration; a fault which the elegance of his expression does not compensate. His judgment was not equal to his genius; and his fictions as an historian are a contrast to his probity as a man. John Ballenden, archdeacon of Murray, translated his history into the Scottish language at the desire of James V. This translation William Hamilton converted, though with imperfections, into English; and his associate Hollingshed published his work in his chronicle, with additions and improvements by the ingenious Francis Thynne.

BOEDROMIA, in antiquity, solemn feasts held at Athens in memory of the success brought by Ion to the Athenians, when invaded by Eumolpus son of Neptune, in the reign of Erechtheus. Plutarch gives another account of the boedromia; which, according to him, were celebrated in memory of the victory obtained by Theseus over the Amazons, in the month Boedromion.

BOEDROMION, in chronology, the third month of the Athenian year, answering to the latter part of our August and beginning of September.

BOEHMEN (Jacob), called the *Teutonic Philosopher*, was a noted visionary of the 17th century, born in a village of Germany near Gortitz, in 1575. He was bred a shoemaker; and marrying, supported a large family by this occupation; until, after amusing himself with chemistry, a visionary turn of mind, heated by sermons and German divinity, got the upper hand of his common sense, and produced raptures and notions of divine illumination. These he first gave vent to in 1612, by a treatise intitled *Aurora, or the rising of the Sun*; being a mixture of astrology, philosophy, chemistry, and divinity, written in a quaint obscure style. This being censured by the magistrates of Gortitz, he remained silent for seven years; but improving that interval by pursuing the flights of his imagination, he resumed his pen; and resolving to redeem the time he had lost, he, in the remaining five years of his life, published above 20 books, which greatly needed what he concluded with, *A table of his principles, or a key to his writings*; though this has not proved sufficient to render them intelligible to common apprehension. The key above mentioned appeared in 1624, and he did not long survive it. For early in the morning of the 18th of November that year, he called one of his sons, and asked him "if he also heard that excellent music?"

B. eodromia
Boehmen.

Bœotia,
Boerhaave.

music?" to which being answered in the negative, he ordered the door to be set open, that the music might be the better heard. He asked afterwards what o'clock it was? and being told it had struck two, he said "It is not yet my time; my time is three hours hence." In the interim he was heard to speak these words: "O thou strong God of hosts, deliver me according to thy will! O thou crucified Lord Jesus, have mercy upon me, and receive me into thy kingdom!" When it was near six o'clock, he took his leave of his wife and sons, and blessed them, and said, "Now I go hence into paradise;" then bidding his son turn him, he immediately expired his last breath in a deep sigh. A great number of persons have been inveigled by the visions of this fanatic, notwithstanding his talents in involving the plainest things in myltery and ænigmatical jargon. Among others, the famous Quirinus Kahlman may be reckoned the principal of his followers in Germany; who says, he had learned more being alone in his study, from Boehmen, than he could have learned from all the wise men of that age together; and, that we may not be in the dark as to what sort of knowledge this was, he acquaints us, that amidst an infinite number of visions it happened, that, being snatched out of his study, he saw thousands of thousands of lights rising round about him. Nor has he been without admirers, and those in no small number, in England; among the foremost of whom stands the famous Mr William Law, author of *Christian Perfection*, &c. who has favoured his countrymen with an English edition of Jacob Boehmes's works in 2 vols 4to.

BŒOTIA, the name of two ancient kingdoms, one of which was founded or rather restored by Cadmus, and named by him *Bœotia*, from the ox which is said to have directed him to the place where he built the capital of his new kingdom, better known afterwards by the name of *Thebes*. But as the inhabitants were scarce ever distinguished as a nation by the name of *Bœotians*, but of *Thebans*, we refer to the article *THEBES* for their history, &c.

The other Bœotia was in Thessaly, and is said to have been founded by Bœotus the son of Neptune and brother of Æolus, by Arne the daughter of Æolus king of Æolis. This last, having sent his daughter to Metapontium a city of Italy, she was there delivered of those two sons, the eldest of whom she called after her father's name *Æolus*; and he possessed himself of the islands in the Tyrrhenian, now the Tuscan sea, and built the city of Lipara. Bœotus the younger son went to his grandfather and succeeded him in his kingdom, called it after his own name, and the capital city *Arne*, from his mother. All that we know of these Bœotians is, that they held this settlement upwards of 200 years; and that the Thessalians expelled them from it; upon which they came and took possession of that country, which till then had been called *Cadmeis*, and gave it the name of *Bœotia*. Diodorus and Homer tell us, that these Bœotians signalized themselves at the Trojan war; and the latter adds, that five of Bœotus's grandsons, viz. Peneleus, Leitus, Prothœnor, Arcefilaus, and Clonius, were the chiefs who led the Bœotian troops thither.

BOERHAAVE (Herman), one of the greatest physicians, as well as the best men, that this or per-

haps any age has ever produced, was born in 1668 at Boerhaave Vorhout, a village near Leyden. At the age of 16 he found himself without parents, protection, advice, or fortune. He had already studied theology and the other ecclesiastical sciences, with the design of devoting himself to a clerical life; but the science of nature, which equally engaged his attention, soon engrossed his whole time. This illustrious person, whose name afterwards spread throughout the world, and who left at his death above L. 200,000, could at that time barely live by his labours, and was compelled to teach the mathematics to obtain necessaries. But in 1693, being received doctor in the science of physic, he began practice; and his merit being at length discovered, many powerful friends patronized him, and procured him three valuable employments: the first was that of professor of medicine in the university of Leyden; the second, that of professor of chemistry; and, thirdly, that of professor of botany. The Academy of Sciences at Paris, and the Royal Society at London, invited him to become one of their members. He communicated to each his discoveries in chemistry. The city of Leyden became in his time the school of Europe for this science, as well as medicine and botany. All the princes of Europe sent him disciples, who found in this skilful professor, not only an indefatigable teacher, but even a tender father, who encouraged them to pursue their labours, consoled them in their afflictions, and solaced them in their wants. When Peter the Great went to Holland in 1715, to instruct himself in maritime affairs, he also attended Boerhaave to receive his lessons. His reputation was spread as far as China: a Mandarin wrote to him with this inscription, "To the illustrious Boerhaave, physician in Europe;" and the letter came regularly to him. The city of Leyden has raised a monument in the church of St Peter, to the salutary genius of Boerhaave, *Salutifero Boerhaavii genio sacrum*. It consists of an urn upon a pedestal of black marble: six heads, four of which represent the four ages of life, and two the sciences in which Boerhaave excelled, form a group issuing between the urn and its supporters. The capital of this basis is decorated with a drapery of white marble, in which the artist has shown the different emblems of disorders and their remedies. Above, upon the surface of the pedestal, is the medallion of Boerhaave: at the extremity of the frame, a ribband displays the favourite motto of this learned man; *Simplex vigilum veri*, "Truth unarrayed."

From the time of the learned Hippocrates, no physician has more justly merited the esteem of his contemporaries, and the thanks of posterity, than Boerhaave. He united to an uncommon genius, and extraordinary talents, the qualities of the heart, which gave them so great a value to society. He made a decent, simple, and venerable appearance, particularly when age had changed the colour of his hair. He was an eloquent orator, and declaimed with dignity and grace. He taught very methodically, and with great precision; he never tired his auditors, but they always regretted that his discourses were finished. He would sometimes give them a lively turn with raillery; but his raillery was refined and ingenious, and it enlivened the subject he treated of, without carrying with it any thing severe or satirical. A declared foe to all excess, he considered

dered decent mirth as the salt of life. It was the daily practice of this eminent person, through his whole life, as soon as he rose in the morning, which was generally very early, to retire for an hour to private prayer, and meditation on some part of the Scriptures. He often told his friends, when they asked him how it was possible for him to go through so much fatigue? that it was *this* which gave him spirit and vigour in the business of the day. *This* he therefore recommended as *the best rule* he could give: for nothing, he said, could tend more to the health of the body than the tranquillity of the mind; and that he knew nothing which could support himself, or his fellow-creatures, amidst the various distresses of life, but a well-grounded confidence in the supreme Being upon the principles of Christianity. This was strongly exemplified in his own illness in 1722, which can hardly be told without horror; and by which the course of his lectures as well as his practice was long interrupted. He was for five months confined to his bed by the gout, where he lay upon his back without daring to attempt the least motion; because any effort renewed his torments, which were so exquisite, that he was at length not only deprived of motion but of sense. Here his medical art was at a stand; nothing could be attempted, because nothing could be proposed with the least prospect of success. But, having (in the sixth month of his illness) obtained some remission, he determined to try whether the juice of fumitory, endive, or succory, taken thrice a day in a large quantity, (*viz.* above half a pint each dose), might not contribute to his relief; and by a perseverance in this method he was wonderfully recovered. This patience of Boerhaave's was founded not on vain reasonings, like that of which the Stoics boasted; but on a religious composure of mind, and Christian resignation to the will of God.

Of his sagacity and the wonderful penetration with which he often discovered and described, at the first sight of a patient, such distempers as betray themselves by no symptoms to common eyes, such surprising accounts have been given, as scarcely can be credited, though attested beyond all doubt. Yet this great master of medical knowledge was so far from a presumptuous confidence in his abilities, or from being puffed up by his riches, that he was condescending to all, and remarkably diligent in his profession; and he often used to say, that the life of a patient (if trifled with or neglected) would one day be required at the hand of the physician. He always called the poor his *best patients*; for God (said he) is their paymaster. The activity of his mind sparkled visibly in his eyes. He was always cheerful, and desirous of promoting every valuable end of conversation; and the excellency of the Christian religion was frequently the subject of it: for he asserted, on all proper occasions, the divine authority and sacred efficacy of the Scriptures; and maintained, that they only could give peace of mind, that sweet and sacred peace which passeth all understanding; since none can conceive it but he who has it; and none can have it but by divine communication. He never regarded calumny nor detraction (for Boerhaave himself had enemies), nor ever thought it necessary to confute them. "They are sparks (said he) which, if you do not blow, will go out of themselves. The

surest remedy against scandal, is to *live it down* by a perseverance in well-doing; and by praying to God that he would cure the distempered minds of those who traduce and injure us." Being once asked by a friend, who had often admired his patience under great provocations, whether he knew what it was to be angry, and by what means he had so entirely suppressed that impetuous and ungovernable passion? he answered, with the utmost frankness and sincerity, that he was naturally quick of resentment; but that he had, by daily prayer and meditation, at length attained to this mastery over himself.

About the middle of the year 1737, he felt the first approaches of that fatal illness which brought him to the grave, *viz.* a disorder in his breast, which was at times very painful, often threatened him with immediate suffocation, and terminated in an universal dropsy: but during this afflictive and lingering illness, his constancy and firmness did not forsake him; he neither intermitted the necessary cares of life, nor forgot the proper preparations of death. About three weeks before his dissolution, when the Rev. Mr. Schultens, one of the most learned and exemplary divines of the age, attended him at his country-house, the Doctor desired his prayers, and afterwards entered into a most remarkable judicious discourse with him on the spiritual and immaterial nature of the soul; and this he illustrated to Mr. Schultens with wonderful perspicuity, by a description of the effects which the infirmities of his body had upon his faculties; which yet they did not so oppress or vanquish, but his soul was always master of itself, and always resigned to the pleasure of its maker—and then he added, "He who loves God ought to think nothing desirable but what is most pleasing to the supreme goodness." These were his sentiments, and such was his conduct in this state of weakness and pain. As death approached nearer, he was so far from terror or confusion, that he seemed less sensible of pain, and more cheerful under his torments, which continued till the 23d day of September, 1738, on which he died (much honoured and lamented) between four and five in the morning, in the 70th year of his age—often recommending to the bye-standers a careful observation of St. John's precepts concerning the love of God, and the love of man, as frequently inculcated in his first epistle, particularly in the fifth chapter. His funeral oration was spoken in Latin before the university of Leyden, to a very numerous audience, by Mr. Schultens, and afterwards published at their particular desire. He wrote, 1. *Institutiones Medicæ.* 2. *Aphorismi de cognoscendis & curandis Morbis.* 3. *Institutiones & Experimenta Chemicæ.* 4. *Libellus de Materia Medica, et remedio rumformis quæ serviant aphorismis.* Swieten published, *Commentaries upon his Aphorisms*, in 5 vols 4to; and several other works, all greatly esteemed.

BOERHAAVIA; a genus of the monogynia order, belonging to the monandria class of plants. There is no calyx; the corolla is monopetalous, campanulated, and plaited; and the seed is one, naked, and below. There are six species, all natives of the Indies. Some of these plants rise five or six feet high, but most of them only 18 inches or two feet. They carry flowers of a yellow or red colour, but are by no means so remarkable as to merit any particular description.

Boef. hot,
Boethius.

•BOESCHOT, a town of the Austrian Netherlands, in the province of Brabant, seated on the river Nethe, in E. Long. 4. 45. N. Lat. 51. 5.

BOETHIUS, or BOETIUS (Flavius Anicius Manlius Torquatus Severinus), a prose as well as poetical writer of the 6th century, born of one of the noblest families of the city of Rome. The time of his birth is related to have been about that period in the Roman history when Augustulus, whose fears had induced him to a resignation of the empire, was banished, and Odoacer king of the Herulians began to reign in Italy, viz. in the year of Christ 476, or somewhat after. The father of Boetius dying while he was yet an infant, his relations undertook the care of his education and the direction of his studies. His excellent parts were soon discovered; and, as well to enrich his mind with the study of philosophy as to perfect himself in the Greek language, he was sent to Athens. Returning young to Rome, he was soon distinguished for his learning and virtue, and promoted to the principal dignities in the state, and at length to the consulate. Living in great affluence and splendor, he addicted himself to the study of theology, mathematics, ethics, and logic; and how great a master he became in each of these branches of learning, appears from those works of his now extant. The great offices which he bore in the state, and his consummate wisdom and inflexible integrity, procured him such a share in the public councils, as proved in the end his destruction; for as he employed his interest with the king for the protection and encouragement of deserving men, so he exerted his utmost efforts in the detection of fraud, the repressing of violence, and the defence of the state against invaders. At this time Theodoric the Goth had attempted to ravage Campania; and it was owing to the vigilance and resolution of Boetius that that country was preserved from destruction. At length, having murdered Odoacer, Theodoric became king of Italy, where he governed 33 years with prudence and moderation, during which time Boetius possessed a large share of his esteem and confidence. It happened about this time that Justin, the emperor of the east, upon his succeeding to Anastasius, made an edict condemning all the Arians, except the Goths, to perpetual banishment from the eastern empire: in this edict Hormisdas bishop of Rome, and also the senate, concurred. But Theodoric, who, as being a Goth, was an Arian, was extremely troubled at it; and conceived an aversion against the senate for the share they had borne in this proscription. Of this disposition in the king, three men of profligate lives and desperate fortunes, Gaudentius, Opilio, and Basilus, took advantage. Having entertained a secret desire of revenge against Boetius, for having been instrumental in the dismissal of the latter from a lucrative employment under the king, they accused him of several crimes; such as the slitting a charge, the end whereof was to involve the whole senate in the guilt of treason; and an attempt, by dethroning the king, to restore the liberty of Italy; and, lastly, they suggested, that, to acquire the honours he was in possession of, Boetius had had recourse to magical art. Boetius was at this time at a great distance from Rome; however, Theodoric transmitted the complaint to the senate, enforcing it with a suggestion that the safety, as well of the

people as the prince, was rendered very precarious by this supposed design to exterminate the Goths. The senate, perhaps fearing the resentment of the king, and having nothing to hope from the success of an enterprise which, supposing ever it to have been meditated, was now rendered abortive, without summoning him to his defence, condemned Boetius to death. The king, however, apprehending some bad consequence from the execution of a sentence so flagrantly unjust, mitigated it to banishment. The place of his exile was Ticinum, now the city of Pavia, in Italy: being in that place separated from his relations, who had not been permitted to follow him into his retirement, he endeavoured to derive from philosophy those comforts which that alone was capable of affording to one in his forlorn situation, sequestered from his friends, in the power of his enemies, and at the mercy of a capricious tyrant; and accordingly he there composed that valuable discourse, intitled, *De Consolatione Philosophiæ*. About two years after his banishment, Boetius was beheaded in prison by the command of Theodoric. His tomb is to be seen in the church of St Augustine, at Pavia, near the steps of the chancel.

The extensive learning and eloquence of this great man are conspicuous in his works, which seem to have been collected with great care; an edition of them was printed at Venice, in one volume folio, in 1499. In 1570, Glareanus, of Basil, collated that with several manuscripts, and published it, with a few various readings in the margin. His chief performance is that abovementioned, *De Consolatione Philosophiæ*; a work well known in the learned world, and to which the afflicted have often applied. In particular, our Saxon king Alfred, whose reign, though happy upon the whole, was attended with great vicissitudes of fortune, had recourse to it at a time when his distresses compelled him to seek retirement; and that he might the better impress upon his mind the noble sentiments inculcated in it, he made a complete translation of it into the Saxon language, which, within these few years, has been given to the world in its proper character. And Camden relates, that queen Elizabeth, during the time of her confinement by her sister Mary, to mitigate her grief, read and afterwards translated it into very elegant English. But it deserves also particular notice, that he is the most considerable of all the Latin writers on music; and that his treatise *De Musica* supplied for some centuries the want of those Greek manuscripts which were supposed to have been lost.

BOG properly signifies a quagmire, covered with grass, but not solid enough to support the weight of the body; in which sense it differs only from marshes or fens, as a part from the whole: some even restrain the term bog to quagmires pent up between two hills; whereas fens lie in champaign and low countries, where the descent is very small.—To drain boggy lands, a good method is, to make trenches of a sufficient depth to carry off the moisture; and if these are partly filled up with rough stones, and then covered with thorn-bushes and straw, to keep the earth from filling up the interstices, a stratum of good earth and turf may be laid over all; the cavities among the stones will give passage to the water, and the turf will grow at top as if nothing had been done.

Boethius
Bog.

BOG, or *Bog of Gight*, a small town of Scotland, seated near the mouth of the river Spey, in W. Long. 2. 23. N. Lat. 57. 48.

Bog-Spavin. See FARRIERY, § xxxii. 3:

BOGARMITÆ. See BOGOMILI.

BOGIO, or **BUEIL**, a town in the county of Nice in Piedmont, situated on the frontiers of France, in E. Long. 6. 47. N. Lat. 44. 12.

BOGLIO, a district in the territories of the duke of Savoy, lying on the river Tinca on the frontiers of Provence; the capital is of the same name.

BOGLIO, a town of Piedmont, and county of Nice, being the capital of a territory of the same name. E. Long. 4. 50. N. Lat. 44. 12.

BOGOMILI, or **BOGARMITÆ**, in church history, a sect of heretics, which sprung up about the year 1179. They held, that the use of churches, of the sacrament of the Lord's supper, and all prayer, except the Lord's prayer, ought to be abolished; that the baptism of Catholics is imperfect; that the Persons of the Trinity are unequal; and that they oftentimes made themselves visible to those of their sect. They said, that devils dwelt in the churches, and that Satan had resided in the temple of Solomon from the destruction of Jerusalem to their own time.

BOGOTO, the capital of New Granada in Terra Firma in South America, near which are gold mines. It is subject to Spain. W. Long. 73. 55. N. Lat. 4. 0.

BOGUDIANA (Pliny), a part of the Mauritania Tingitana in Africa. According to Cluverius, it is the *Tingitana*, anciently so called from King Bogud.

BOHEA, in commerce, one of the coarsest kinds of tea that come from China. See **THEA**.

BOHEMIA, a kingdom of Europe, subject to the house of Austria, and surrounded on every side with woods and mountains as with a natural rampart. It is bounded on the east by Moravia and part of Silesia, on the north by Lusatia and Upper Saxony, on the west by Franconia, and on the south by Bavaria. Although this kingdom is situated in the middle of Germany, and its king is an elector of the empire, it has nevertheless its particular assemblies, customs, and language, different from the Germans. It is one of the most elevated countries of Europe: for no river enters into it, though many have their source there; the chief of which are the Elbe, the Oder, the Vistula, and the Morava. The air is cold and unwholesome; for they have more epidemical diseases than in the neighbouring countries. There are mines of silver, copper, lead, and even some veins of gold. The capital city is Prague; the others are Cuttenburg, Konigengretz, Pilsen, Czastaw, Budweys, Egra, Glatz, Tabor, and a great number of others: for they reckon more than 100 cities, among which almost 40 have the title of *Royal*. The name *Bohemia*, in the German language, signifies the *home, or abode, of the Boii*, a people of ancient Gaul, who under their leader Sergovefus settled in that country about 590 years before the Christian æra. These Boii were soon after expelled by the Marcomanni, a nation of the Suevi, who were afterwards subdued by the Scavi, a people of Scythia, whose language is still spoken in Bohemia and Moravia. Notwithstanding this expulsion of the Boii, the present inhabitants are still called *Bohemians* by foreigners, but the natives call themselves *Zechs*. At first they were governed by

dukes; but the emperor Otho I. conquered the duke of Bohemia, and reduced the province under the empire. Afterwards Henry V. gave the title of *king* to Ladislaus duke of Bohemia; and since that time these kings have been electors and chief cup-bearers of the empire, and the kingdom has been elective; which privileges have been confirmed by the golden bull. Formerly the kings of Bohemia received the kingdom as a fief of the empire, which ceremony was practised upon the frontiers; after which, the standards of the principalities of which it is composed were given to them, without being torn and given to the people, as is done with the ensigns of the other fiefs of the empire. Ferdinand I. of Austria, having married Anne, sister of Lewis, last king of Bohemia, who died without issue, and being elected king, that kingdom has remained in his family ever since. But the crown is conferred with some appearance of election; which right the states of Bohemia still pretend to claim, notwithstanding that, by the treaty of Westphalia, Bohemia is declared hereditary in the house of Austria.

The king of Bohemia is the first secular elector, and gives his opinion after the elector of Cologne; though he does not assist at the assembly of electors, except at the election of an emperor. For these 200 years past they have not appeared at the collegiate assemblies, nor even at the imperial diets. However, in 1708, the emperor caused one of his deputies, in quality of king of Bohemia, to enter into the college of electors at the diet of Ratisbon, by the form of re-admission, together with the deputy of the elector of Brunswick. The states of Bohemia have never been comprehended in the government, or in the circles of the empire; they are not subject to any of its jurisdictions, nor to the Roman months, taxes, or public contributions; and they owe nothing to the empire but what the emperor Leopold voluntarily imposed upon himself, which amounts to 6000 livres a-year for the imperial chamber. The king pays homage to the emperor and the empire for his states as first secular elector; otherwise he has a right to exercise, through the whole extent of his dominions, all authority that the royalty can give, provided he do not violate the laws of the kingdom; according to which he cannot raise contributions or taxes but at the time when the states are assembled, the appointing of which is entirely in their own power. The government of Bohemia is different from that of all other states, the affairs of the kingdom being managed by six different courts. First, the council of the regency, or the great royal council, in which presides the great judge or burgrave of Bohemia, and who has under him 18 lieutenants of the king and other assessors. Secondly, the council or superior chamber of justice, at which the great master of the kingdom is president. Thirdly, the chamber of fiefs. Fourthly, the new tribunal to judge the appeals of the German vassals in their differences on the account of fiefs; which court has also its president, vice-president, and assessors. Fifthly, the royal chamber of finances, which has a president and vice-president. Sixthly, the chancery, which always follows the court. Besides, every circle of Bohemia is governed by two bailiffs, who administer justice in their prefecture. The states are composed of the clergy, lords, nobles, and burghers. As to Moravia, there is a grand bailiff who governs it in the name of the

Bohemian
||
Boiano.

king of Bohemia, as Margrave of Moravia. He is at the head of the royal council, which is composed of three assessors, and in which all is transacted in the name of the king. This province is divided into five circles, each of which has its bailiff. There are, besides, other officers of justice, who have a right of judging only at certain times, and in particular cases, where an appeal is allowed.

Bohemia was divided by the emperor Charles IV. into 12 provinces, in each of which he ordered two captains to be appointed every year for the administration of the government. The same emperor caused the church of Prague to be erected into an archbishopric, with this advantage, that the archbishop of Prague should have the prerogative that the archbishop of Mentz formerly enjoyed, *viz.* of crowning the king of Bohemia. The duchy of Silesia, the marquisate of Moravia, and that of Luface, formerly held of this crown, but now only that of Moravia, which is incorporated with the kingdom of Bohemia, and is in the possession of the house of Austria.

The only remarkable occurrence in the Bohemian history is the rebellion of the disciples of John Huss, and Jerome of Prague, on account of their leaders having been burnt as heretics. This occasioned a bloody war of 16 years continuance. For a particular account of which, see the article HUSSITES.

BOHEMIAN BOLE. See BOLE.

BOHEMIAN Brethren, a sect of Christian reformers which sprung up in Bohemia in the year 1467. They treated the pope and cardinals as antichrist, and the church of Rome as the whore spoken of in the Revelation. They rejected the sacraments of the Romish church, and chose laymen for their ministers. They held the Scriptures to be the only rule of faith, and rejected the Popish ceremonies in the celebration of the mass, nor did they make use of any other prayer than the Lord's Prayer. They consecrated leavened bread. They allowed no adoration but of Jesus Christ, in the communion. They rebaptized all such as joined themselves to their congregation. They abhorred the worship of saints and images, prayers for the dead, celibacy, vows, and fasts; and kept none of the festivals but Christmas, Easter, and Whitsuntide.

In 1504, they were accused by the Catholics to King Ladislaus II. who published an edict against them, forbidding them to hold any meetings either privately or publicly. When Luther declared himself against the church of Rome, the Bohemian brethren endeavoured to join his party. At first that reformer showed a great aversion to them; but the Bohemians sending their deputies to him in 1523 with a full account of their doctrines, he acknowledged that they were a society of Christians whose doctrine came nearest to the purity of the gospel. This sect published another confession of faith in 1535, in which they renounced anabaptism, which they at first practised: upon which a union was concluded with the Lutherans, and afterwards with the Zuinglians, whose opinions from thenceforth they continued to follow.

BOHOL, one of the Philippine islands in Asia, lying to the northward of Mindanao, in E. Long. 122. 5. N. Lat. 10. 0.

BOIANO, a town of Italy, in the kingdom of Naples, and county of Melfe, with a bishop's see. It

is seated at the foot of the Apennines, near the river Tilerno, in E. Long. 14. 38. N. Lat. 41. 30.

BOIARDO (MATTEO MARIA of Ferrara), count of Scandiano, celebrated for his Italian poems, lived in the 15th century. His principal work is his *Orlando innamorato*. His Latin eclogues and sonnets are also much admired.

BOJARS denote Russian noblemen. See RUSSIA.

BOIEMUM, (anc. geog.) a part of Germany, surrounded with the Montes Sudeti, Ptolemy; now called Bohemia. It took its name from the Boii, a people of Gaul, who removed thither before Cæsar's expedition into that country, (Cæsar); though he seems to err in the name. The Boii were afterwards driven out by the Marcomanni, and settled in the west of Vindelicia, which was afterwards called Bayern, and hence the name Bavaria.

BOII, (Cæsar); a people of Celtica, extending from the Ligeris to the Elaver, whence came the Boii of Gallia Cisalpina, whose migration is related by Livy.

BOII. See BOHEMIA.

BOIGUACU, in zoology, a synonyme of the boa constrictor. See BOA.

BOIL, or FURUNCLE. See the *Index* subjoined to MEDICINE, and SURGERY.

BOILEAU SIEUR DESPEREAUX (Nicholas), the celebrated French poet, was born at Paris in 1636. After he had gone through his course of polite literature and philosophy, his relations engaged him to the study of the law, and he was admitted advocate. But tho' he had all the talents necessary for the bar, yet he could not adapt himself to a science which turns upon continual equivocations, and often obliges those who follow it to clothe falsehood in the garb of truth. He therefore determined to study theology; but he could not long endure the thorns of school divinity. He imagined, that, to allure him more cunningly, chicanery, which he thought to avoid, had only changed her habit; and so he renounced the Sorbonne, betook himself entirely to the belles lettres, and took possession of one of the foremost places in Parnassus. The public gave his works the encomium they deserved; and Lewis XIV. who always loved to encourage the sciences and polite literature, was not only pleased to have Mr Boileau's works read to him constantly as he composed them, but settled a yearly pension of 2000 livres upon him, and gave him the privilege of printing all his works. He was afterwards chosen a member of the French academy and also of the academy of medals and inscriptions. This great man, who was as remarkable for his integrity, his innocence, and diffusive benevolence, as for the keenness of his satires, died of a dropsy on the 2d of March 1711, in the 75th year of his age. The *Lutrin* of Boileau, still considered by some French critics of the present time as the best poem to which France has given birth, was first published in 1647. It is with great reason and justice that Voltaire confesses the *Lutrin* inferior to the *Rape of the Lock*. Few poets can be so properly compared as Pope and Boileau; and, wherever their writings will admit of comparison, we may, without any national partiality, adjudge the superiority to the English bard. These two great authors resembled each other as much in the integrity of their lives, as in the subjects and execution of their several compositions. There are two ac-

Boiardo
||
Boileau.

Boiling. tions recorded of Boileau, which sufficiently prove that the inexorable fatirist had a most generous and friendly heart; when Patru, the celebrated advocate, who was ruined by his passion for literature, found himself under the painful necessity of selling his expensive library, and had almost agreed to part with it for a moderate sum, Boileau gave him a much superior price; and, after paying the money, added this condition to the purchase, that Patru should retain, during his life, the possession of the books. The succeeding instance of the poet's generosity is yet nobler:—when it was rumoured at court that the king intended to retrench the pension of Corneille, Boileau hastened to Madam de Montespan, and said, that his sovereign, equitable as he was, could not, without injustice, grant a pension to an author like himself, just ascending Parnassus, and take it from Corneille, who had so long been seated on the summit; that he entreated her, for the honour of the king, to prevail on his majesty rather to strike off his pension, than to withdraw that reward from a man whose title to it was incomparably greater; and that he should more easily console himself under the loss of that distinction, than under the affliction of seeing it taken away from such a poet as Corneille. This magnanimous application had the success which it deserved, and it appears the more noble, when we recollect that the rival of Corneille was the intimate friend of Boileau. The long unreserved intercourse which subsisted between our poet and Racine was highly beneficial and honourable to both. The dying farewell of the latter is the most expressive eulogy on the private character of Boileau: “Je regarde comme un bonheur pour moi de mourir avant vous,” said the tender Racine, in taking a final leave of his faithful and generous friend.

BOILING, or EBULLITION, the bubbling up of any fluid. The term is most commonly applied to that bubbling which happens by the application of fire, though that which ensues on the mixture of an acid and alkali is sometimes also distinguished by the same name. Boiling, in general, is occasioned by the discharge of an elastic fluid through that which is said to boil; and the appearance is the same, whether it is common air, fixed air, or steam, that makes its way through the fluid. The boiling of water is proved by Dr Hamilton of Dublin, in his essay on the ascent of vapour, to be occasioned by the lowermost particles of the water being heated and rarified into vapour by reason of the vicinity of the bottom of the containing vessel; in consequence of which, being greatly inferior in specific gravity to the surrounding fluid, they ascend with great velocity, and lacerating and pushing up the body of water in their ascent, give it the tumultuous motion called *boiling*. That this is occasioned by steam, and not by particles of air or fire, as some have imagined, may be very easily proved in the following manner: Let a common drinking glass be filled with hot water, and then inverted into a vessel of the same: as soon as the water in the vessel begins to boil, large bubbles will be observed to ascend in the glass, which will displace the water in it, and in a short time there will be a continual bubbling from under its edge; but if the glass is then drawn up, so that its mouth may only touch the water, and a cloth dipt in cold water be applied to the outside, the steam within it will be instantly condensed,

and the water will ascend so as to fill it entirely, or very nearly so. See the article EVAPORATION.

BOILING, in trade and manufactures, is a preparation given to divers sorts of bodies by making them pass over the fire, chiefly in water, tho' sometimes in other liquors. In this sense we speak of the boiling of salt, boiling of sugar, copperas, &c.

BOILING of Silk with Soap is the first preparation in order to dyeing it. Thread is also boiled in a strong lixivium of ashes to prepare it for dyeing.

BOILING, in the culinary art, is a method of dressing meats by coction in hot water, intended to soften them, and dispose them for easier digestion. The effects of boiling are different according to the kinds and qualities of the water. Pulse boiled in sea-water grow harder; mutton boiled in the same becomes softer and tenderer than in fresh water, but tastes saltish and bitter.

BOILING to Death (caldarius decoquere), in the middle age; a kind of punishment inflicted on thieves, false coiners, and some other criminals.

BOILING, is also a method of trying or essaying the goodness or falseness of a colour or dye. The stuff is to be boiled in water with certain drugs, different according to the kind or quality of the colour, to try whether or no it will discharge, and give a tincture to the water. With this view crimson silks are boiled with alum, and scarlets with soap, in quantity equal to the weight of the silk.

BOILING Wells, in natural history. See BURNING-Springs, and ICELAND.

BOINITZ, a town of Upper Hungary, in the county of Zell, remarkable for its baths and the quantity of saltpetre that grows about it. E. Long. 19. 10. N. Lat. 48. 42.

BOIOBI, in zoology, the name of a species of serpent found in America, and called by the Portuguese *cobra de verb*. It is about an ell in length, of the thickness of a man's thumb, and is all over of a very beautiful and shining green. Its mouth is very large, and its tongue black. It loves to be about houses, and never injures any creature unless provoked or hurt; but it will then bite, and its poison is very fatal. The natives take as a remedy against its poison, the root *caa apia* bruised, and mixed with water. See *CAA Apia*.

BOIORUM DESERTA, (anc. geog.) a district of Pannonia, so called from the excision of the Boii by the Getae. Now the Weinerwald, of Lower Austria, towards Stiria, to the east of mount Cetius, or the Hahlenberg, and south of Viudobona or Vienna.

BOIQUIRA, the American name for the rattlesnake.

BOIS-LE-DUC, called by the Dutch *Hertogenbosch*, a large, strong, and handsome town of the Netherlands, in Dutch Brabant, seated between the rivers Dommel and Aa among morasses, in E. Long. 6. 16. N. Lat. 31. 45.

Bois de Soignies, the forest of Soignies, in the Austrian Netherlands and province of Brabant, about three miles south-east of Brussels.

Bois de Coiffi, the name given to a South American tree growing about Surinam, held in the highest estimation by the Indians in that part of the world, and now recommended to the physicians in Europe by Dr

Bokhara.

Fermin in a treatise lately published at Amsterdam. The root is esteemed an excellent stomachic, restoring the appetite, and assisting digestion; but it is chiefly celebrated as an infallible remedy against even the most inveterate intermittents. It is said also to be used with great safety and advantage in every species of remittent and continued fever, with patients of all ages, sexes, and conditions, even during pregnancy, and in the puerperal state. Before employing it, however, it is absolutely necessary to administer either a purgative or emetic. The best method of exhibiting it is in decoction: half an ounce of the bark of the root must be boiled in a close vessel with six pints of water till one half be consumed; the decoction is then strained off, and a cupful taken every two hours till the fever is entirely extinguished. Six or seven days after a cure is thus performed, it is generally necessary to repeat the purgative.

BOISSARD (John James), a famous antiquarian, born at Besançon the capital of Franche Compté in France. He published several collections which are of great use to such as are desirous to understand the Roman antiquities. He had a great passion for this study; and drew with his own hand plans of all the ancient monuments of Italy. He died at Metz, October 30th 1602. His principal works are, 1. Four volumes in folio of Roman antiquities, adorned with plates engraved by Theodore de Bey and his two sons. 2. *Theatrum vite humane*: which contains the lives of 198 famous persons, with their portraits. 3. A treatise de divinatione & magicis praeiigiis. These works are scarce, and esteemed by the antiquarians.

BOIT, an excellent painter in enamel. He was born in Stockholm, and bred a jeweller: which profession he intended to follow in England; but changed his design, and went into the country, where he taught children to draw. He there engaged a gentleman's daughter, who was one of his scholars, to promise him marriage; but the affair being discovered, he was thrown into prison. In that confinement, which lasted two years, he studied enamelling; an art to which he fixed, on his return to London, and practised with the greatest success. The prices he is said to have obtained for his work are almost incredible: but being engaged in a very large design for the court, and Queen Anne dying before it was completed, he ran in debt, his goods were seized by execution, and he fled to France; where he changed his religion, was countenanced by the regent, and obtained a pension of L. 250 per annum, but died suddenly at Paris in 1726. There is a large piece done by him at Kensington, representing Queen Anne sitting, and Prince George standing by her; and at Bedford-house is another very large plate of the duke's father and mother.

BOITJAFU, in zoology, the name of a species of serpent found in America; and called by the Portuguese there, *cobra di apo*. It grows to seven or eight feet long, is about the thickness of a man's arm, and very small and taper towards the tail. Its back is of an olive colour; its belly yellow, and covered with very regular and elegant triangular scales. It feeds on frogs, &c. but is very poisonous, and its bite extremely fatal.

BOKHARA, a city of Tartary in Asia, and capital of Great Bukharia, situated one days journey to the N^o 49.

north of the river Jehun, or Amu; in E. Long. 65. 50. N. Lat. 39. 15. In 1219 it was besieged by Jenghiz Khan, as being part of Sultan Mohammed's dominions a descendant of the famous Mahmud Gazari. At that time, besides the city-walls, which were very strong, Bokhara had an outward inclosure 12 leagues in compass; which shut in not only the suburbs, but also many pleasant seats and farms watered by the river Soghd, from whence the ancient Sogdiana took its name. The Mogul army arrived before the place in July, and continued the siege during the following winter. In March 1220, they forced the outer wall, and began to besiege the city in form. Sultan Mohammed had left in the city a very numerous garrison under the command of three generals, who made a sally at the head of 20,000 men: but being repulsed with great loss, their courage failed them; and, instead of staying to defend the inhabitants, as soon as they had got into the city by one gate, passed out by another with their families, and almost all their soldiers, hoping to escape by the darkness of the night; but their design being discovered, they were pursued by a detachment of 30,000 Moguls; and being overtaken at the river Amu, they were, after a bloody dispute, almost all cut to pieces. Mean time, Jenghiz Khan, being informed of the confusion into which the city had been thrown by the desertion of the garrison, ordered an attack to be made on all sides at once; but while he was preparing for this, the magistrates and clergy went out and presented him with the keys of the city. Jenghiz Khan granted them their lives, on condition that they gave no shelter to any of the sultan's soldiers, and put out all who should be suspected of being in that prince's interest; which they promised to do upon oath. All the young people, however, who were displeased with the surrender, retired with the governor to the castle, which was very strong, and resolved to defend themselves to the last extremity. Jenghiz Khan, having taken possession of Bokhara, entered on horseback into the great mosque, and asked merrily if that was the sultan's palace? On being answered that it was the house of God, he alighted; and giving the principal magistrate his horse to hold, mounted the gallery where the ecclesiastics usually sat, and then taking up the Koran, threw it under the feet of his horses. Having staid there for some time, he retired to his camp; where, some days after, having assembled the principal people of Bokhara, and ascended a pulpit erected for that purpose in the midst of them, he began his speech by praising God, and recounted all the favours he had received from the Almighty: he then mentioned the perfidious behaviour of their sultan towards himself, telling them that God had sent him to rid the world of such wicked men. As to them, he testified his satisfaction for their having freely furnished his army with necessaries; and promised that his soldiers should not meddle with any goods which they made use of in their houses; but commanded them to deliver up what they had hidden, under pain of being tortured. This speech had such an effect, that the poor inhabitants delivered up every thing, as well what they had concealed as what they had present use for; notwithstanding which, the tyrant soon after caused the city to be burnt, on pretence that some of the sultan's soldiers were concealed in it. As all the houses were made

Bol made of wood, except the sultan's palace which was built of stone, and some few private houses of brick, the whole was utterly consumed; and Jenghiz Khan having found some few soldiers that had actually concealed themselves, put them all to death without mercy. The castle surrendered at discretion soon after; and though it was demolished, the governor and garrison, out of a very extraordinary piece of clemency from so bloody a tyrant, had their lives spared. Bokhara continued in ruins for some years, but at length Jenghez Khan ordered it to be rebuilt. It is now large and populous; and is the residence of a khan who is altogether despotic, though his power reaches but a little way without the city. The town is seated on a rising ground, with a slender wall of earth and a dry ditch. The houses are low, built mostly of mud; but the caravanseras and mosques, which are numerous, are all of brick. The bazars or market-places, which have been stately buildings, are now mostly in ruins. The inhabitants are more civilized and polite than some of their neighbours; and yet are cowardly, cruel, effeminate, and very perfidious. Great numbers of Jews and Arabians frequent this place, though they are much oppressed, and frequently deprived of all their properties by the khan or his attendants at pleasure. At best they pay heavy taxes, and it is almost criminal to be rich.

BOL (Hans or John), a painter, born at Mecklin in 1534. He received his first instructions from a master of no great repute, whom he soon left; and going to Heidelberg, employed himself in copying several pictures of the eminent artists. His subjects are chiefly landscapes with animals; but he also sometimes painted history, with no small success. We have by him a set of landscapes, views in Holland, slightly etched, but in a style that indicates the hand of the master. He died in 1593.

BOL (Perdmand), a celebrated painter both of history and portraits, was born at Dort in 1611, and educated at Amsterdam. In the school of the celebrated Rembrandt Gerretz, he received his instructions as a painter; and imitated the style of his master with no little success, not only in his pictures but in his engravings. Bol's etchings are bold and free. The lights and shadows in them are broad and powerful, which renders the effect very striking; but they want that lightness of touch and admirable taste which those of Rembrandt possess in so great a degree. Bol died at Dort, the place of his birth, in 1681, aged 70.

BOKHARIA. See **BUKHARIA**.

BOLANDUS (John), a famous Jesuit, born at Tillemont in the Netherlands, in 1596. He distinguished himself by writing the lives of the saints, under the title of *Acta Sanctorum*, of which he published five volumes in folio; but died while he was labouring at the sixth, in the 70th year of his age. The continuators of that work are called *Bollandists*.

BOLBETINUM, (anc. geog.), the second month of the Nile reckoning from west to east; now very small, choaked up with sand, and called *le Bras de Bolim*.

BOLENTIUM, (anc. geog.), a town of Pannonia Superior; now *Raczburg* in Styria. See **RACKERSBURG**.

BOLES, are viscid earths, less coherent and more friable than clay; more readily uniting with water,

and more freely subsiding from it. They are soft and unctuous to the touch; adhere to the tongue; and by degrees melt in the mouth, impressing a slight sense of astringency. There are a great variety of these earths; the principal of which are the following.

1. Armenian bole, when pure, is of a bright red colour with a tinge of yellow: It is one of the hardest and most compact bodies of this class, and not smooth and glossy like the others, but generally of a rough and dusty surface. It does not effervesce with acids, though some part of it is dissolved by all of them. Neumann observes, that four ounces of Armenian bole distilled in a glass retort in an open fire, yielded three drachms of a saline phlegm, which smelt a little visinous, and changed syrup of violets green. In the neck of the retort was found a little powdery saline matter which had an ammoniacal taste, but it was in too small quantity to be collected or further examined. Like most other coloured earths, this kind of bole contains a portion of ferruginous matter, to which the colour is owing; and which may be separated by the magnet, after the bole has been calcined with oil or other inflammable matters. It is likewise impregnated with vitriolic acid; and hence, when mixed with nitre or sea-salt, it extricates the acids of these salts in the fire.

2. French bole is of a pale red colour, variegated with irregular specks of white and yellow. It is much softer than the Armenian, and slightly effervesces with acids.

3. Bole of Blois is yellow, remarkably lighter than most of the other yellow earths, and effervesces strongly with acids.

4. Bohemian bole is of a yellow colour, with a cast of red, and generally of a slaky texture. It is not acted on by acids.

5. Lemnian earth is of a pale red colour, and slightly effervesces with acids.

6. Silesian bole is of a pale yellow colour, and acids have no sensible effect upon it.

These and other earths, made into little masses, and stamped with certain impressions, are called *terre sigillata*. They have been recommended as astringent, sudorific, and alexipharmic; but these and many other virtues that have been ascribed to them appear to have no foundation. They are still, however, prescribed in fluxes and complaints of the prime viæ.

BOLESLAFF, or **BURZALAV**, a town of Silesia, seated on the river Bobar, in E. Long. 16. 0. N. Lat. 51. 12.

BOLESLAUS I. and II. kings of Poland. See **POLAND**.

BOLETUS, **SPUNK**: A genus of the order of fungi, belonging to the cryptogamia class of plants; of which botanists enumerate 17 species. The following are the most remarkable. 1. The *fuberulosus*, or white cork spunk, grows commonly on the trunks of birch and willow trees in England and Scotland. It grows sessile and horizontal; its figure is semicircular; the upper side convex, the under nearly plain; of various sizes, from that of an ass's hoof to a peck-measure. The upper surface is quite white, generally covered with a short strong down, but sometimes smooth. The flesh or internal substance is thick, white, tough, light, and spongy, like cork; and is sometimes cut and shaped by the country people, and used as corks in their bottles.

Boletes,
Boleyn.

but such corks must not be suffered to touch the liquid, for moisture soon renders them soft and useless.

2. The ignarius, or touchwood spunk, is frequent on the trunks of old trees of all kinds, especially ash. It consists of a very hard woody substance, in shape like a horse's hoof, and grows of various sizes, from a man's fist to that of his head and larger. The upper side is smooth, but uneven, distinguished near the rim by elevated zones of different colours, brown, grey, tawny, &c. The flesh is of a tawny brown colour, extremely hard and tough. This fungus is made use of in Germany and some parts of England for tinder. The Germans boil it in strong lye, dry it and boil it again in solution of saltpetre. The Laplanders burn it about their habitations, in order to keep off a species of the gashly which is fatal to the young reindeer. It has been used to stop the bleeding of the vessels after amputations †. For this purpose the hard outer part is cut off, and the soft inner substance is beat with a hammer to make it still softer. It is best when gathered in August or September.

3. The bovinus, or cow spunk, is frequent in woods and pastures. It is generally of a brown colour, though sometimes it is tawny, yellowish brown, reddish brown, deep red, purple, or greenish brown. The flesh is yellow, white, or reddish. The young plants are eaten in Italy, and esteemed a great delicacy. The Germans also account them a dainty, calling them *gombas*, and *brat-bulz*. Cows, deer, sheep, and swine, will feed upon this and other boleti, and are sometimes greatly disordered by them. In cows and other cattle they have been known to create bloody urine, nauseous milk, swellings of the abdomen, inflammations of the bowels, stoppages, diarrhoeas, and death. In sheep they bring on a scirrhous liver, a cough, a general wasting, and dropsy. *Scarabs*, *dermestes*, and many other insects, feed upon and breed in them in abundance.

4. The pini larices, or agaric of the shops, grows on old larch trees. This fungus is an irregular spongy substance, extremely light, and of an uniform snowy whiteness. (except the cortical part, which is usually taken off before the agaric is brought into the shops). It cuts freely with a knife, without discovering any hardness or grittiness, and readily crumbles betwixt the fingers into a powder. It has no remarkable smell; its taste is at first sweetish; but on chewing for a short time, it proves acrid, bitter, and nauseous. Agaric was formerly in great esteem as a cathartic, but the present practice has almost entirely rejected its use. It is now rejected both by the London and Edinburgh Colleges, but it still retains a place in most of the new foreign Pharmacopœias. It operates exceeding slowly, inasmuch that some have denied it to have any purgative virtue at all. Given in substance, it almost always occasions a nausea, not unfrequently vomiting, and sometimes excessive tormina of the bowels: these effects are attributed to its light farinaceous matter adhering to the coats of the intestines, and producing a constant irritation. The best preparation of agaric seems to be an extract made with water, in which sixt alkaline salt has been dissolved; or with vinegar or wine: the first is used by Boulduc, and the two latter by Neumann, to prove an effectual and safe purgative. Nevertheless, this is at best a precarious medicine, of which we stand in no manner of need.

BOLEYN (Ann), queen of Henry VIII. of Eng-

land; memorable in the English history, as the first cause of the reformation, as the mother of queen Elizabeth under whom it was completely established, and also on account of her own sufferings. She was the daughter of Sir Thomas Boleyn, and born in 1507. She was carried into France at seven years of age by Henry VIII's sister, who was wife of Lewis XII: nor did she return into England when that queen retired thither after the death of her husband; but staid in the service of queen Claudia the wife of Francis I. and after the death of that princess went to the ditches of Alençon. The year of her return is not well known: some will have it to have been in 1527, others in 1525. This much is certain, that she was married of honour to queen Catharine of Spain, Henry VIII's first wife; and that the king fell extremely in love with her. She behaved herself with so much art and address, that by refusing to satisfy his passion, she brought him to think of marrying her: and the king, deceived by her into a persuasion that he should never enjoy her unless he made her his wife, was induced to set on foot the affair of his divorce with Catharine, which at last was executed with great solemnity and form. A celebrated author observes, that "That which would have been very praise-worthy on another occasion, was Ann Boleyn's chief crime: since her refusing to comply with an amorous king, unless he would divorce his wife, was a much more enormous crime than to have been his concubine. A concubine (says he) would not have dethroned a queen, nor taken her crown or her husband from her; whereas the crafty Ann Boleyn, by pretending to be chaste and scrupulous, aimed only at the usurpation of the throne, and the exclusion of Catharine of Arragon and her daughter from all the honours due to them." In the mean time, Henry could not procure a divorce from the Pope; which, we know, made him resolve at length to disown his authority, and to sling off his yoke. Nevertheless he married Anne Boleyn privately upon the 14th of November 1532, without waiting any longer for a release from Rome; and as soon as he perceived that his new wife was with child, he made his marriage public. He caused Anne Boleyn to be declared queen of England on Easter-eve 1533, and to be crowned the first of June following. She was brought to bed upon the 7th of September of a daughter, who was afterwards queen Elizabeth; and continued to be much beloved by the king, till the charms of Jane Seymour had fired that prince's heart in 1536. Then his love for his wife was changed into violent hatred: he believed her to be unchaste, and caused her to be imprisoned and tried. "She was indicted of high treason, for that she had procured her brother and other four to lie with her, which they had done often: that she had said to them, that the king never had her heart; and had said to every one of them by themselves, that she loved him better than any person whatever; which was to the slander of the issue that was begotten between the king and her. And this was treason according to the statute made in the 26th year of this reign; so that the law which was made for her and the issue of her marriage, is now made use of to destroy her." She was condemned to be either burnt or beheaded; and she underwent the latter on the 19th of May 1536. The right reverend author of the *History of the Reformation*,

Boleyn.

† *Boil.*
Tranf.
vol. xlviii.
p. 2. and
lix. p. 1.

Boleyn,
Boling-
broke

relates some very remarkable things of her behaviour during the time of her imprisonment, and a little before her execution. When she was imprisoned, she is said to have acted very different parts; sometimes seeming devout and shedding abundance of tears, then all of a sudden breaking out into a loud laughter. A few hours before her death, she said, that the executioner was very hardy: and besides, that she had a very small neck; at the same time feeling it with her hands, and laughing heartily. However, it is agreed that she died with great resolution; taking care to spread her gown about her feet, that she might fall with decency; as the poets have related of Polyxena, and the historians of Julius Cæsar. Roman-catholic writers have taken all occasions to rail at this unhappy woman, as well through vexation at the schism which she occasioned, as for the sake of defaming and dishonouring queen Elizabeth by this means; and they have triumphed vehemently, that in the long reign of that queen, no endeavours were used to justify her mother. But either queen Elizabeth or her ministers are greatly to be admired for prudence in this respect; since it is certain, that Anne Boleyn's justification could never have been carried on without discovering many things which must have been extremely prejudicial to the queen, and have weakened her right instead of establishing it. For though the representations of the papists are in no wise to be regarded, yet many things might have been said to the disadvantage of her mother, without transgressing the laws of true history; as that she was a woman gay even to immodesty, indiscreet in the liberties she took, and of an irregular and licentious behaviour.

BOLINGBROKE, or BULLINGBROKE, a town of Lincolnshire in England, and of great antiquity, but now in a mean condition. It gives title of Viscount to the St Johns of Battersea. E. Long. o. 40. N. Lat. 53. 15.

BOLINGBROKE (Henry St John), lord viscount, a great statesman and philosopher, descended from an ancient and noble family, was born about the year 1672. He had a regular and liberal education; and by the time he left the university, was considered as a person of uncommon qualifications: but with great parts, he had, as it usually happens, great passions, and these hurried him into many indiscretions and follies. Contrary to the inclinations of his family, he cultivated Tory connections; and gained such an influence in the House of Commons, that in 1704 he was appointed secretary of war and of the marines. He was closely united in all political measures with Mr Harley: when, therefore, that gentleman was removed from the seals in 1707, Mr St John resigned his employment; and in 1710, when Mr Harley was made chancellor of the exchequer, the post of secretary of state was given to Mr St John. In 1712 he was created Baron St John of Lediard-Trigg in Wiltshire, and Viscount Bolingbroke. But being overlooked in the bestowal of vacant ribbons of the order of the garter, he resented the affront, renounced the friendship of Harley then earl of Oxford, and made his court to the Whigs. Nevertheless, on the accession of George I. the seals were taken from him; and being informed that a resolution was taken to pursue him to the scaffold, for his conduct regarding the treaty of Utrecht, he withdrew to France. Here he accepted an invitation to enter into

the Pretender's service, and accepted the seals as his secretary: but he was as unfortunate in his new connections as in those he had renounced; for the year 1715 was scarcely expired, when at the same time that he was attainted of high treason at home, the seals and papers of his foreign secretary's office were taken from him; followed by an accusation from the Pretender and his party, of neglect, incapacity, and treachery. Such a complication of distressful events threw him into a state of reflection, that produced by way of relief a *consolatio philosophica*, which he wrote the same year under the title of *Reflections upon exile*; and the following year drew up a vindication of his conduct with respect to the Tories, in the form of *A Letter to Sir William Wyndham*. His first lady being dead, he about this time espoused a niece of the famous Madam Maintenon, and widow of the marquis de Villette, with whom he had a very large fortune. In 1723 the king was prevailed on to grant him a free pardon, and he returned in consequence to England; but was by no means satisfied within, while he was yet no more than a mere titular lord, and remained excluded from the house of peers. This stigma operated to fix him in enmity to Sir Robert Walpole, to whose secret enmity he attributed his not receiving the full extent of the king's clemency: hence he distinguished himself by a multitude of political writings, till the year 1735; when being thoroughly convinced that the door was finally shut against him, he returned once more to France. In this foreign retreat he began his course of Letters on the study and use of History, for the use of Lord Combury, to whom they are addressed. Upon the death of his father, who lived to be extremely old, he settled at Battersea, the ancient seat of his family, where he passed the remainder of his life in philosophical dignity. Pope and Swift, one the greatest poet, the other the greatest wit, of the time, perfectly adored him; and it is well known that the former received from him the materials for his incomparable poem the "Essay on Man."—He died in 1751, and left the care and benefit of his MSS. to Mr Mallet, who published them together with his former printed works, in 5 vols 4to: they are also printed in 8vo.

BOLISAW, a town of the kingdom of Bohemia in Germany, situated in E. Long. 14. 35. N. Lat. 50. 25.

BOLKOWITZ, a town of Silesia, in the duchy of Glogaw. E. Long. 15. 20. N. Lat. 51. 27.

BOLLARDS, large posts set into the ground on each side of a dock. On docking or undocking ships, large blocks are lashed to them; and through these blocks are reeved the transporting hawfers to be brought to the capstons.

BOLLITO, a name by which the Italians call a *sea green colour* in artificial crystal. To prepare this colour, you must have in the furnace a pot filled with 40 lb. of good crystal, first carefully skimmed, boiled, and purified, without any manganese: then you must have twelve ounces of the powder of small leaves of copper three calcined, and half an ounce of zaffre in powder: mix them together; and put them at four times into the pot, that they may the better mix with the glass; stirring them well each time of putting in the powder, lest the mixture should swell and run over.

BOLOGNA, an ancient, large, and very handsome town of Italy, in the territory of the church, and capital

Boling-
broke
||
Bologna.

Bologne
||
B. France.

capital of the Bolognese; an archbishop's see, and an university. The public buildings are magnificent, as well with regard to the architecture as the ornaments, especially the paintings, which are done by the greatest masters. There are a vast number of palaces, in one of which the pope's nuncio resides; the private houses are also well built. Here are 169 churches, and the town is said to contain about 80,000 inhabitants. All the gates and windows are open during the summer; insomuch that one may see into their apartments and gardens, where there are vast numbers of orange-trees that perfume the air. It is a place of great trade, which is in some measure owing to a canal that runs from this city to the river Po. The Reno, which runs near Bologna, turns 400 mills that are employed in the silk-works; besides, they deal in wax, soap, hams, sausages, and even lap-dogs, which are greatly esteemed. It is seated at the foot of the Apennine mountains, in E. Long. 11. 30. N. Lat. 44. 27.

BOLOGNE, by the English commonly called *Bullon*, a city of Picardy in France, and capital of the Boulonois, seated near the sea. It is divided into two towns, the Upper and Lower; the first is strongly fortified, the other is inclosed by walls only. The port is at the mouth of the river Liane, but the water is so shallow that no ships of burden can enter it. It is defended on the side of the river by a mole, which shelters it from the winds, and at the same time prevents the river from silting it with silt. E. Long. 9. 17. N. Lat. 50. 42.

BOLOGNESE, a small province of Italy, in the territory of the church, bounded on the north by the Ferrarese, on the west by the duchy of Modena, on the south by Tuscany, and on the east by Romania. It is watered by a great number of small rivers, which render its soil the most fertile of any in Italy. Bologna is the capital, and from the great produce of the land about it is called *Bologna the fat*. It produces abundance of all sorts of grain and fruits; particularly macedoine grapes, which are in high esteem. Here are mines of alum and iron; and the inhabitants fabricate large quantities of linen, silk stockings, and cloth.

BOLOGNESE. See GRIMALDI.

BOLOGNIAN or **BONONIAN STONE**, a phosphoric substance first discovered near Bologna in Italy, whence it received its name. It has been supposed to contain some metallic matter, on account of its great specific gravity; but it is now found to be only a compound of ponderous earth and vitriolic acid. It differs, however, from the artificial barofelenite in the proportion of its ingredients, the latter containing 33 parts of vitriolic acid and 67 of earth; the former 84 of earth, 13 of the most concentrated vitriolic acid, and three of water. Mr Scheffer, in the Memoirs of the Academy at Stockholm, for the year 1753, has communicated some experiments on a stone of this kind from China, which prove, that it perfectly agrees with the descriptions given in several books of a stone called *petunise* by the Chinese, and which is said to be used in their porcelain manufactures.

BOLSANE, a town of Germany, in the territory of Tyrol, and circle of Austria. It is very agreeably situated in the midst of a fine large valley, full of villages, and abounding in vineyards. The wines in this valley are the best in all Tyrol; but they must be drunk

the year after that of their growth, otherwise they become unfit for use. E. Long. 11. 11. N. Lat. 46. 42.

BOLSENNNA, a town of Italy, in the territories of the pope, seated on a lake of the same name. E. Long. 11. 3. N. Lat. 42. 37.

BOLSTER, among surgeons, a soft yielding substance, either laid under the head or a broken limb. In this sense, bolsters are contrived for crooked, bunched, and otherwise distorted backs, shoulders, &c.

By a constitution made under archbishop Burchier, the clergy are forbidden to wear bolsters about their shoulders, in their gowns, coats, or doublets. The occasion of the prohibition is variously construed. Some say that bolsters came in fashion in the reign of King Richard III. who being necessitated, by his natural deformity, to pad the courtiers, and even the clergy, did the same, out of complaisance to their prince, so that every body who had the misfortune to be born straight, was obliged to wear a bolster on his shoulders to be in the fashion. Others, however, controvert this; alleging that the constitution above mentioned was made 20 years before the usurpation of Richard.

BOLSTERS of a Saddle, those parts of a great saddle which are raised upon the bows, both before and behind, to hold the rider's thigh, and keep him in a right posture.

BOLSWAERT, a town of the united Provinces, in West Friesland, and in the county of Westergoe. E. Long. 5. 35. N. Lat. 53. 6.

BOLSWERT, or **BOLSWERD**, (*Boetius Adam à*), an engraver and printseller established at Antwerp, was the descendant of a family who resided at the city of Bolwert in Friesland, from whence he derived his name. He flourished about 1620; but by what matter he was instructed in the art of engraving, does not appear. He worked with the graver only; the free open style of the Bloemarts he imitated with great success; and perhaps perfected himself in their school. When he worked from Rubens, he altered that style; and his plates are neater, fuller of colour, and more highly finished. The two following from this master may be here mentioned. 1. The Resurrection of Lazarus, a large upright plate. 2. The Last Supper, its companion. Bafin, speaking of this print, says, that it proves by its beauty, and the knowledge with which it is engraved, that Boetius could sometimes equal his brother Scheltius.

BOLSWERT or *Bolswerd*, (*Scheltius à*), an admirable engraver, was the brother of Boetius Adam à Bolwert, mentioned in the preceding article. We have no other account of his family than what is there given; nor unfortunately any of himself of the least consequence. The time of his birth and of his death, and the name of the master he studied under, are equally unknown. Bolwert worked entirely with the graver, and never called in the assistance of the point. His general character as an artist is well drawn by Bafin, in the following words: "We have a large number of prints, which are held in great esteem, by this artist, from various masters; but especially from Rubens, whose pictures he has copied with all possible knowledge, taste, and great effect. The freedom with which this excellent artist handled the graver, the picturesque roughness of etching, which he could imitate without any other assisting instrument, and the ability he possessed

Bolfenna
||
Bolfwert.

Bovert. fessed of distinguishing the different masses of colours, have always been admired by the connoisseurs, and give him a place in the number of those celebrated engravers, whose prints ought to be considered as models by all historical engravers, who are desirous of rendering their works as useful as they are agreeable, and of acquiring a reputation as lasting as it is justly merited." He drew excellently, and without any manner of his own; for his prints are the exact transcripts of the pictures he engraved from. His best works, though not always equally neat or finished, are always beautiful, and manifest the hand of the master. Sometimes we find his engravings are in a bold, free, open style: as the Brazen Serpent, the Marriage of the Virgin, &c. from Rubens. At other times they are very neat, and sweetly finished: as, the Crowning with Thorns, and the Crucifixion, &c. from Vandyck. Mr. Strutt observes, that his boldest engravings are from Rubens, and his neatest from Vandyck and Jordans.—How greatly Bolfwert varied his manner of engraving appears from some prints, which, like the greater part of those of his brother Boetius, bear great resemblance to the free engravings of the Bloemarts, and to those of Frederic Bleemart especially; and form a part of the plates for a large folio volume, entitled, *Academie de L'Espece*, by Girard Thibault of Antwerp, where it was published, A. D. 1628; and to these he signs his name, "Scheltius," and sometimes "Schelderic Bolfwert," adding the word Brussels. His name is usually affixed to his plates in this manner, "S. A. Bolfwert." It is very necessary to caution the collectors of this master's works (those especially who are not very conversant with them), that many of them have been copied in a very careful manner, so as easily to deceive the unskilful. Some of these copies, as the Marriage of the Virgin from Rubens, &c. are by Lauwers. But those which are most likely to mislead, are by Ragot, a French engraver, employed by Mariette the print-seller, who frequently meeting with the reverses or counterproofs from the prints of Bolfwert, gave them to the engraver; and he imitated them with the utmost precision. By this means the impressions from the plate copied come upon the paper the same way with the original. It is true, his name is usually affixed at the bottom; but it is often cut off, and then the copy is not easily distinguished from the original. Among other prints thus imitated by Ragot from Bolfwert, is Christ crucified between the two Thieves, where the soldier is represented piercing his side, from Rubens.

Among the variety of estimable engravings by this great artist, the few following may be here mentioned. 1. The Brazen Serpent, a large plate, lengthwise, from Rubens. Those impressions are the most estimable which have only the word *Antwerp* at the right-hand corner, without the name of Giles Hendrix, which was afterwards inserted above it, and part of the small circle over the arms is left white. 2. Abraham offering his son Isaac, a large plate nearly square, from Theodore Raubout. 3. The education of the Virgin by Saint Anne, a middling-sized upright plate, from Rubens. Those impressions without the name of

Hendrix are the most esteemed. 4. The marriage of the Virgin, a middling-sized upright plate, from the same painter. Those impressions are best in which the word *Antwerp* is not added to the name of Hendrix. 5. The adoration of the wise men, a middling-sized upright plate, from the same. The good impressions of this plate have the name of Vanden Enden. 6. The feast of Herod, in which is represented the daughter of Herodias, presenting the head of John the Baptist to her mother, a large plate, lengthwise, from the same. 7. The miraculous draught of fishes; a large print, lengthwise, on three plates, from the same. 8. Christ crowned with thorns; a large upright plate from Vandyck: An admirable print; with the name of Vanden Enden. 9. A crucifixion, where a figure appears presenting the sponge to Christ, St John and the Virgin are standing at the foot of the cross, and Mary Magdalene is reclining towards it: A large upright plate, from Vandyck. Of this admirable engraving there appear to have been four different impressions; though Basan mentions only three, and says that in the first the left hand of St John is hid. The chief marks of those impressions are: In the 1st, St John's left hand appears on the shoulder of the Virgin (A). In the 2d impression, the hand is erased: This Basan calls the first impression; and it sells at a very high price. In the 3d impression, the hand is restored: In the 4th, it is again erased: And in both, the short strokes upon the ground near the great toe of the figure who holds the sponge are crossed with second strokes; which cross-hatchings are not in the two first impressions. There are several other crucifixions by the same master after different designs. 10. The god Pan playing upon his flute, from Jordans. 11. Mercury and Argus, a large plate, lengthwise, from the same. 12. A drunken Silenus, supported by a satyr, and another figure; a middling-sized upright plate from Rubens. Of these three last, the impressions without the address of Bloteling are the best. 13. A chase of lions; a large plate, lengthwise, from the same. 14. A variety of landscapes.

BOLT, among builders, an iron-fastening fixed to doors and windows. They are generally distinguished into three kinds, viz. plate, round, and spring bolts.

BOLTS, in gunnery, are of several sorts; as, 1. Transum-bolts, that go between the checks of a gun carriage, to strengthen the transums. 2. Pile bolt: the large knobs of iron on the checks of a carriage, which keep the hand-spike from sliding, when it is poizing up the breech of a piece. 3. Traverse bolts: the two short bolts, that, being put one in each end of a mortar carriage, serve to traverse her. 4. Bracket bolts: the bolts that go through the checks of a mortar, and by the help of quoins keep her fixed at the given elevation. And, 5. Bed-bolts: the four bolts that fasten the brackets of a mortar to the bed.

BOLTS, in a ship, are iron pins, of which there are several sorts, according to their different makes and uses. Such are drove-bolts, used to drive out others. Ray-bolts, with joints or bars on each side, to keep them from flying out of their holes. Cleavel-bolts, which are clenched with riveting hammers. Forelock-bolts,

Bolfwert,
Bolt.

(A) Prints of this impression are very rare, and at sales have been known to fetch from L. 25 to L. 50.

Bolt
||
Bolton.

bolts, which have at the end a forelock of iron driven in to keep them from starting back. Set bolts, used for forcing the planks, and bringing them close together. Fend or fender bolts, made with long and thick heads, and struck into the uttermost bends of the ship, to save her sides from bruises. And ring-bolts, used for bringing to of the planks, and those parts whereto are fastened the breeches and tackle of the guns.

Bolt of Canvas, in commerce, the quantity of 28 ells.

Bolt-Rope, in naval affairs, a rope passing round the sail, to which the edges of it are sewed, to prevent the sail from tearing; the bottom part of it is called the *foot-rope*; the sides, *leeches*; and if the sail be oblong or square, the upper part is called the *head-rope*.

BOLTED FLOUR, that which has passed thro' the bolters. See the following article.

BOLTER, or **BOULTER**, a kind of sieves for meal, having the bottoms made of woollen, hair, or even wire. The bakers use bolters which are worked by the hand; millers have a larger sort, wrought by the motion of the mill.

BOLTING, a term of art used in our Inns of Court, whereby is intended a private arguing of cases. The manner of it at Gray's Inn is thus: An ancient and two barristers sit as judges; three students bring each a case, out of which the judges choose one to be argued; which done, the students first argue it, and after them the barristers. It is inferior to *mooting*; and may be derived from the Saxon word *bolt*, "a house," because done privately in the house for instruction. In Lincoln's Inn, Mondays and Wednesdays are the bolting days in vacation time; and Tuesdays and Thursdays the moot days.

BOLTING, or *Boulting*, the act of separating the flour from the bran, by means of a sieve or bolter. See **BOLTER**.

Bolting-Cloth, or *Blyer-cloth*, sometimes also called *boulting-cloth*, denotes a linen or hair cloth for sifting meal or flour.

Bolting Mill, a versatile engine for sifting with more ease and expedition. The cloth round this is called the *bolter*.

BOLTING, or *Boulting*, among sportsmen, signifies rousing or dislodging a coney from its resting place. They say, to *bolt* a coney, *flout* a hare, *rouse* a buck, &c.

BOLTON or **BOULTON** (Edmund), an ingenious English antiquarian, who lived in the beginning of the 17th century. His most considerable work is that intitled *Nero Caesar, or Nero's reign depraved*, dedicated to the Duke of Buckingham, lord-admiral, printed at London 1624, folio, and adorned with several curious and valuable medals. It is divided into 55 chapters, in some of which are introduced curious remarks and observations. In the 24th and 25th chapters he gives an account of the revolt in Britain, against the Romans, under the conduct of Boadicea, which he introduces with a recapitulation of the affairs in Britain from the first entrance of the Romans into this island under Julius Caesar, till the revolt in the reign of Nero. In chapter 36th he treats of the East-India trade in Nero's time, which was then carried on by the river Nile, and from thence by caravans over land to the Red Sea, and thence to the Indian ocean; the ready coin carried

yearly from Rome upon this account amounting, according to Pliny's computation, to above L. 300,000 Sterling; and the usual returns in December and January yielding in clear gain an hundred for one. Besides this he wrote, 1. An English translation of Lucius Florus's Roman history. 2. Hypercritica, or a rule of judgment for reading or writing our histories. 3. The elements of armonies, &c.; and some other works.

BOLTON, a town of Lancashire in England, seated on the river Croell, and pretty well built. It has a manufacture for fustians, and the market is considerable for cloth and provisions. W. Long. 2. 15. N. Lat. 53. 55.

BOLUS, in pharmacy, an extemporaneous form of a medicine, soft, coherent, a little thicker than honey, and the quantity of which is a little morsel or mouthful; for which reason it is by some called *buc-cola*.

BOMAL, a town of Luxemburg in the Austrian Netherland, situated on the river Ourt, in E. Long. 5. 30. N. Lat. 50. 20.

BOMB, in military affairs, a large shell of cast iron, having a great vent to receive the fusee, which is made of wood. The shell being filled with gunpowder, the fusee is driven into the vent or aperture, within an inch of the head, and fastened with a cement made of quicklime, ashes, brick-dust, and steel-silings, worked together in a glutinous water; or of four parts of pitch, two of colophony, one of turpentine, and one of wax. This tube is filled with a combustible matter, made of two ounces of nitre, one of sulphur, and three of gunpowder dust, well rammed. To preserve the fusee, they pitch it over, but uncase it when they put the bomb into the mortar, and cover it with gunpowder-dust; which having taken fire by the flash of the powder in the chamber of the mortar, burns all the time the bomb is in the air; and the composition in the fusee being spent, it fires the powder in the bomb, which bursts with great force, blowing up whatever is about it. The great height a bomb goes in the air, and the force with which it falls, makes it go deep into the earth.

Bombs may be used without mortar-pieces, as was done by the Venetians at Candia, when the Turks had possessed themselves of the ditch, rolling down bombs upon them along a plank set sloping towards their works, with ledges on the sides, to keep the bomb right forward. They are sometimes also buried under ground to blow up. See **CAISSON**.—Bombs came not into common use before the year 1634, and then only in the Dutch and Spanish armies. One Malthus an English engineer is said to have first carried them into France, where they were put in use at the siege of Collioufe. The French have lately invented a new sort of bombs of vast weight called *comminges*.—The art of throwing bombs makes a branch of gunnery, founded on the theory of projectiles, and the laws and qualities of gunpowder. See **GUNNERY**, **PROJECTILES**, **GUNPOWDER**, &c.

Bomb-Chest, is a kind of chest filled usually with bombs, sometimes only with gunpowder, placed under ground, to tear and blow it up in the air with those who stand on it. Bomb-chests were formerly much used to drive enemies from a post they had seized or

Bol
||
Bolton

mb
bax. were about to take possession of: they were set on fire by means of a fasciſſee fastened at one end, but they are now much diſſiſed.

Bomb-Tree, which are ſmall ſhips formed for throwing bombs into a fortiſſ, are ſaid to be the invention of M. Reyneau, and to have been firſt uſed at the Lombard of Algiers. Till then it had been judged impracticable to bombard a place from the ſea. See *KARCH*.

BOMBARD, a piece of ordnance anciently in uſe, exceedingly ſhort and thick, and with a very large mouth. There have been bombards which have thrown a ball of 300 pound weight. They made uſe of cranes to load them. The bombard is by ſome called *baſiſſik*, and by the Dutch *donkerbaſſe*.

BOMBARDIER, a perſon employed about a mortar. His buſineſs is to drive the ſuſee, fix the ſhell, and lead and fire the mortar.

BOMBARDIER, in zoology. See *CARABUS*.

BOMBARDMENT, the havoc committed in throwing bombs into a town or fortiſſ.

BOMBARDO, a muſical inſtrument of the wind kind, much the ſame as the baſſoon, and uſed as a baſs to the hautboy.

BOMBASINE, a name given to two ſorts of ſtuſſ, the one of ſilk, and the other croſſed of cotton.

BOMBAST, in compoſition, is a ſerious endeavour, by ſtrained deſcription, to raiſe a low or familiar ſubject beyond its rank; which, inſtead of being ſublime, never fails to be ridiculous. The mind in ſome animating paſſions is indeed apt to magnify its objects beyond natural bounds; but ſuch hyperbolical deſcription has its limits; and, when carried beyond theſe, it degenerates into burleſque, as in the following example.

Sejanus. ————— Great and high,
The world knows only two, that's Rome and I.
My roof receives me not; 'tis air I tread,
And at each ſtep I feel my advanc'd head
Knock out a ſtar in heaven.

SEJANUS, of *Ben. Johnson*, act 5.

A writer who has no natural elevation of genius is extremely apt to deviate into bombast. He ſtrains above his genius, and the violent effort he makes carries him generally beyond the bounds of propriety.

BOMBAX, or *SILK-COTTON TREE*: A genus of the polyandria order, belonging to the monodelphia claſs of plants; and in the natural method ranking under the 37th order, *columniferae*. The calyx is quinquefid: the ſtamina are five or many: the capsule is ligneous, quincquelocular, and quincquevalved: the ſeeds are woolly, and the receptacle pentagonalous.

Species. 1. The ceiba, with a prickly ſtalk. 2. The pentandrum, with a ſmooth ſtalk. 3. The heptaphyllum, with leaves cut into ſeven parts. The firſt and ſecond ſorts grow naturally in both the Indies, where they arrive at a great magnitude, being ſome of the laſteſt trees in theſe parts; in ſomuch that botman ſays he has ſeen in Guinea, trees of this kind to widely diſſiſed that 20,000 armed men might ſtand under the branches of one. They generally grow with very ſtraight ſtems. Thoſe of the firſt ſort are armed with ſhort ſtrong ſpines; but the ſecond hath very ſmooth ſtems, which in the young plant are of a bright green; but after a few years they are covered with a grey

or aſh-coloured bark, which turns brown as they grow older. The branches toward the top are garniſhed with leaves compoſed of five, ſeven, or nine oblong ſmooth little leaves, which are ſpear-shaped, and join to one common centre at their baſe, where they adhere to the long footſtalk. The flower buds appear at the end of the branches; and ſoon after the flowers expand, which are compoſed of five oblong purple petals, with a great number of ſtamina in the centre: when theſe fall off, they are ſucceeded by oval fruit as large as a ſwan's egg, having a thick ligneous cover, which when ripe opens in five parts, and is full of a dark ſhort cotton, including many roundiſh ſeeds as large as ſmall peas. The cotton of the third ſort is of a fine purple colour, but the ſire of the tree is not particularly mentioned by botanical writers. Beſides theſe ſpecies, Mr Miller mentions another which he ſaw in the gardens of the late duke of Richmond at Goodwood, and was raiſed from ſeeds which came from the Eaſt Indies. The ſtem was very ſtraight and ſmooth, the leaves were produced round the top upon very long footſtalks, each being compoſed of ſeven or nine narrow ſilky ſmall lobes, joined at their baſe to the footſtalk in the ſame manner as the firſt and ſecond; but they were much longer and reflected backward, ſo that at firſt ſight it appeared very different from either of them.

Culture. Theſe plants, being natives of warm climates, muſt always be kept in a ſhove. They are raiſed from ſeeds procured in the capsules from the places where they grow naturally. Theſe are to be ſown in the ſpring, in pots of light earth, plunged in a ſubſtantial hot-bed of dung or tan, where the plants will appear in three or four weeks. They muſt then be placed ſeparately in ſmall pots, plunging them in the bark-bed, giving them ſhade and water, and thiſting them occaſionally into larger pots with freſh earth. They muſt be watered plentifully in ſummer, but moderately in winter.

Uſes. The dark ſhort cotton of the firſt two ſpecies is uſed by the poorer inhabitants of theſe places where ſuch trees grow to ſtuſſ pillows or chairs, but is generally deemed unwholeſome to lie upon. The beautiful purple down of the third is ſpun, wrought into clothes, and wore, without being dyed any other colour, by the inhabitants of the Spaniſh Weſt Indies, where the tree naturally grows. Large pirogues, or canoes fit to carry a ſail, are made both at Senegal, and in America, of the trunk of the ſilk-cotton tree, the wood of which is very light, and found uſiſt for any other purpoſe. In Columbus's firſt voyage, ſays Miller, it was reported that a canoe was ſeen at Cuba made of the hollowed trunk of one of theſe trees, which was 65 palms long, of a proportional width, and capable of containing 150 men.

BOMBAX, in zoology, a ſynonime of a ſpecies of *Coxes*. — *Bombax* is alſo uſed ſometimes for ſilk or cotton; but the true botanic name of cotton is *Gossypium*. It is likewiſe applied by Linnæus to ſignify ſuch inſects as have incumbent wings, and ſeckers reſembling a comb.

BOMBAY, an iſland in the Eaſt Indies near the coaſt of Decan, ſituated in N. Lat. 19. 0. and E. Long. 73. 0. It has its preſent name from the Portugueſe *Bom Bahia*, on account of the excellent bay formed

Bombax,
Bombay.

Bombay. formed by it together with the winding of other islands adjacent. The harbour is spacious enough to contain any number of ships, and has likewise excellent anchoring ground, affording also, by its land-locked situation, a shelter from any winds to which the mouth may be exposed.

¹ This island more healthy than formerly, and why.

This island was formerly reckoned exceedingly unhealthy, inasmuch that it had the name of the burying ground of the English, though it is now so far improved in this respect as to be no worse than any other place in the East Indies under the same parallel of latitude. The reasons of this unhealthiness and the subsequent improvements are enumerated by Mr Grose. 1. The nature of the climate, and the precautions required by it, being less understood than they are at present. 2. Formerly there obtained a very pernicious practice of employing a small fry of fish as manure for the cocoa-trees which grow in plenty on the island; though this has been denied by others, and perhaps with justice, as the putrid effluvia of animal bodies seems to be very effectually absorbed by the earth, when buried in it. All agree, however, that the habitations in the woods or cocoa-nut groves are unwholesome by reason of the moisture and want of a free circulation of air. 3. Another cause has been assigned for the superior healthiness of this island, viz. the lessening of the waters by the banking off a breach of the sea, though this does not appear satisfactory to our author. There is still, says he, a great body of salt water on the inside of the breach, the communication of which with the ocean being less free than before the breach was built, must be proportionably more apt to stagnate, and to produce noxious vapours.

* See Agr. Chem., p. 9.

Whatever may be the cause, however, it is certain, that the island of Bombay no longer deserves its former character, provided a due degree of temperance be observed; without which health cannot be expected in any warm climate.

² Climate, &c.

The climate of Bombay seems to be drier than many other parts under the same parallel. The rains last only four months of the year, but with short intermissions. The setting in of the rains is commonly ushered in by a violent-thunder storm called there the *El-phanti* from its extraordinary violence. The air, however, is then agreeably cooled, and the excessive heat, then nearly at its height, much moderated. The rains begin about the end of May, and go off in the beginning of September; after which there never falls any except a short transient shower, and that but very rarely.

³ Fish in all the stagnant pools formed by the rains.

A very extraordinary circumstance is related by Mr Ives concerning the island of Bombay during the rainy season, viz. that, ten days after the rains set in, every pool and puddle swarms with a species of fish about six inches long and somewhat resembling a mullet. Such a phenomenon has occasioned various speculations. Some have imagined that the exhaling power of the sun is so strong in the dry seasons as to be able to raise the spawn of these fishes into the atmosphere, and there suspend and nourish it till the rains come on, when it drops down again in the state of living and perfectly formed fish. A less extravagant supposition is, that after the ponds become dry, the spawn may possibly fall into deep fissures below the apparent bottom, re-

maining there during the dry season, and being supplied with a sufficient quantity of moisture to prevent it from corruption.

Bombay Account the quantity of rain that falls during the rainy season.

The quantity of rain that falls at Bombay in one season has been accurately measured by Mr Thomas, Mr Ives's predecessor as hospital surgeon. His apparatus consisted of a lead cylinder about nine inches diameter, and as many deep, marked on the inside with inches and tenths. To prevent the water from splashing over, he cut a hole two inches from the bottom, and placed the cylinder in a glazed earthen vessel; after which a wax-cloth was securely tied round it, so as to cover the vessel, and prevent any water from getting in, excepting what passed through the cylinder. When more than two inches fell, the hole in the side was stopped with wax, and the water poured from the vessel into the cylinder to ascertain its quantity. It was kept in an open place free from houses, and measured at six in the morning, noon, and six in the evening. The following table shows the quantity of rain that fell from the 25th of May, when it first began, though the sky looked cloudy over land from the beginning of the month.

In this journal our author makes no mention of the elephants above mentioned from Mr Grose as the fore-runner of the rainy season, though he mentions a storm under that name on the 9th of October. It was an excessive hard gale, with violent thunder, lightning, and rain; of which last there fell two inches in no more than four hours. Neither is the quantity of thunder and lightning at all comparable to what people unacquainted with hot climates might be apt to expect. The only thunder-storms mentioned in the journal were on May 31st, June 3d, 5th, 12th, 14th; September 7th, October 9th, an elephanta; and some thunder on the 15th of the same month.

The vegetable productions of Bombay are very insignificant. Mr Ives says, that its "soil is so barren as not to produce any one thing worth mentioning;" but afterwards informs us, that its "natural produce is the cocoa-nut tree, from which they extract a liquor called *tolly*. This is soft and mild when drunk immediately; but if it stands long, it gathers strength, and becomes very intoxicating; whence probably arose the term *tolly-headed*. For each tree a tax of 20s. a-year is paid to the company, which is appropriated towards maintaining the garrison and ships of war."

Mr Grose gives an account somewhat different.— "The *parts*, or cocoa-nut groves, make the most considerable part of the landed property, being planted wherever the situation and soil is favourable to them. When a number of these groves lie contiguous to each other, they form what is called the *woods*; through which there is a due space left for roads and path ways, where one is pleasantly defended from the sun at all hours in the day. They are also thick set with houses belonging to the respective proprietors as well as with the huts of the poorer sort of people; but are very unwholesome for the reasons already given. As to the

cocoa-nut tree itself, not all the minute descriptions I have met with in many authors seem to me to come up to the reality of its wonderful properties and life. The cultivation of it is extremely easy, by means of channels conveying water to the roots, and by the manure already mentioned laid round them. An owner of 200 cocoa-nut trees is supposed to have a competency to live on.

"As to the rice fields, they differ in value, according to the fineness and quantity of rice they produce. The growth of this grain has a particularity not unworthy of notice, viz. that as it loves a watery soil, so to whatever height the water rises, wherever it is planted, the growth of the rice keeps measure with it, even to that of 12 and 14 feet; the summit always appearing above the surface of the water. It is also remarked, that the eating of new rice affects the eyes. The fact is certain, though the physical reason of it is unknown.

"Here and there are interspersed some few *brab* trees, or rather wild palm trees (the word *brab* being derived from *brabe*, which in the Portuguese signifies *wild*.) They bear an insipid kind of fruit, about the bigness of a common pear; but the chief profit from them is the toddy, or liquor drawn from them by incisions at the top, of which the arrack is reckoned better than that produced by the cocoa-nut trees. They are generally near the sea-side, as they delight most in a sandy soil. It is on this tree that the *toddy birds*, so called from their attachment to it, make their exquisitely curious nests, wrought out of the thinnest reeds and filaments of branches, with an inimitable mechanism. The birds themselves are about the size of a partridge, but are of no value either for plumage, song, or the table.

"This island is a strong instance of the benefits of a good government, and a numerous population, by not a spot of it remaining uncultivated: so that tho' it is far from producing sufficient for the consumption of its inhabitants, and notwithstanding its many disadvantages of situation and soil, it yields incomparably more than the adjacent island of Salsette."

Among the curiosities of Bombay Mr Ives mentions a large *terapin* or land tortoise kept at the governor's house, the age of which was upwards of 200 years. Frogs, which abound every where through the East Indies, are very large at Bombay. Our author saw one that measured 22 inches from the extremities of the fore and hind feet when extended; and he supposes that its weight would not have been less than four or five pounds. On the sea-shore round the island are a great variety of beautiful shells, particularly the sort called *ventle-traps* or *acendle-traps*, held in great esteem among the ladies some time ago. Several pounds Sterling are said to have been given by a *virtuosi* for one of these shells when the Commodore Lellie's collection of shells was sold by auction.

Mr Ives enumerates the following kinds of snakes found on this island and other parts of the British empire in the East Indies. 1. The *cobra de capella*, growing from four to eight or nine feet long. They kill by their bite in 15 minutes. 2. The *cobra manilla* is a small bluish snake, of the size of a man's little finger, and about a foot long, frequently seen about old wells. A species of these found at Bombay kill much sooner

Bombay.

than even the former. 3. The *palmira*, a very thin beautiful snake, of different colours: its head is like that of the common viper, but much thicker than the body. Our author saw one that was four feet long, and the body not much thicker than a swan's quill. 4. The green snake is of a very bright green colour, with a sharp head: towards the tail it is smaller than in the middle. The largest part of it is no bigger than a tobacco-pipe. 5. The sand snake is small and short, but not less deadly than the others. 6. The *cobra de aurelia* resembles an earth-worm, is about six inches long, and no bigger than a small crow-quill. It kills by getting into the ear, causing madness, &c. 7. The *manilla bomba* is a very beautiful snake, of almost the same size throughout the whole length, except at the two ends, where it comes to a point. It is white on the belly, but finely variegated on the back. It lives in the sand, and is said to sting with its tail, which occasions contractions in the joints.

Bombay is the most considerable English settlement on the Malabar coast; and by reason of its situation, may be styled the grand storehouse of all the Arabian and Persian commerce. It is also the most convenient place in all the East Indies for careening or heaving down large ships: and for small ones they have a very good dock. They have also a very good rope-yard; and indeed, says Mr Ives, "this is the only place, in this distant part of the world, for shattered ships to repair at, having always a good quantity of naval stores, and its very name conveying an idea of a safe retreat in foul weather."

8.
Different
forts, &c.

On this island are many little forts and batteries, which carry some guns; but the principal fort, which defends the place, has above an hundred. Mr Grose finds fault with the situation of this last fort, which he says, not only does not command the harbour sufficiently, but is itself overlooked by an eminence called Dugharee point. The castle itself is a regular quadrangle, well built of strong hard stone. In one of the battions facing Dugharee point is a large tank or cistern which contains a great quantity of water constantly replenished by the stationary rains. There is also a well within the fort, but the water is not very good, and liable to be dried up by the heats. The water of Bombay in general indeed is not good, which has been given as a reason why the Gentoo merchants were not fond of settling upon it; for as they drink no wine nor spirituous liquors, they are very nice judges of the taste and qualities of waters.

When the town of Bombay began to increase considerably, it was judged proper to add the security of a wall round it to the strength of the fort it had before. Even then, however, it was neglected to take in the dangerous post of Dugharee, which now evidently commands both the town and fort. There has since that time been added, at a great expence, a ditch that encompasses the wall, and can be flooded at pleasure, by letting in the sea, which terminates the ditch on two sides, so that the town is now entirely surrounded with water, and is one of the strongest places in India.

Next to Bombay, the most considerable fort on the island is that of *Mahim*. It is situated at the opposite extremity of the island, and commands the pass of Bandurah, a fort directly opposite to it on the coast of

Salfette. From this island Bombay is separated by an arm of the sea, capable of receiving only small craft. The other forts are capable of making but a slight defence.

About two miles out of town, towards the middle of the island, the sea had gained so far as almost to divide it in two, and rendered the roads impassable. A great quantity of this water, however, was drained off at a very considerable expence, and a causeway raised which kept it from overflowing again. This causeway is above a quarter of a mile in length, and considerably broad; "but (says Mr Grose,) there is one gross fault remarked in it; that, being bending near the middle, the architect has opposed to the sea a re-entering angle instead of a salient one." Within the beach, however, there is still a considerable body of water, that has a free communication with the sea, as appears by its ebbing and flowing; so that it is probable the causeway itself, erected at the expence of at least L. 100,000, may in no long time be totally undermined and thrown down.

When the island of Bombay was ceded to the English by the Portuguese, it was divided, and still continues to be so, into three Roman-Catholic parishes, Bombay, Mahim, and Salvacam. The churches of these are governed by priests of that religion, and of any nation excepting Portugal, who were expressly objected to at the time of cession. The bulk of the land-proprietors at that time were Meltizos and Canarins. The former are a mixed breed of the natives and Portuguese; the latter purely aborigines of the country converted to the popish religion. The other land-owners were Moors, Gentoos, and Parsees; but these last are of more modern date, having purchased estates on the island. The company has also a very considerable landed estate either by purchases, confiscations for crimes, and seizures for debt. The land is laid out in cocoa-nut groves, rice-fields, and onion grounds, which last are reckoned of an excellent quality.

There is only one English church at Bombay, a very neat commodious building seated on a spacious area called the Green; which continues from the church to the fort, and is pleasantly laid out in walks, planted with trees, round which the houses of the English inhabitants are mostly situated. These are generally only ground-floored, with a court-yard before and behind, in which are the offices and out-houses. They are substantially built of stone and lime, and smooth plastered on the outside. They are often kept white-washed, which, however neat, is in some respects very disagreeable, by reason of the excessive glare it occasions in reflecting the light of the sun. Few of them have glass windows to any apartment; the sashes being generally paned with a kind of transparent oyster-shells, square cut; which have the singular property of transmitting sufficient light, at the same time that they exclude the violent glare of the sun, and have besides a cool look. The flooring is generally composed of a kind of loam or stucco called *chunam*, being a lime made of burnt shells, which if well tempered in a peculiar manner known to the natives, is extremely hard and lasting, and takes such a smooth polish, that one may see his own face in it. But where terraces are made of this substance, unless it be duly prepared,

and

Bombay. and which is very expensive, it is apt to crack by the sun's heat. Some attempts have been made to paint the stucco walls in apartments; but these have proved abortive through the ignorance of the artists, who have not chosen colours capable of resisting the alkaline power of the lime*. Our author remarks, that in the gardens of Surat he saw this kind of stucco made use of instead of gravel for the walks. They were a little raised above the garden beds, so that they must be instantly dry after the most violent rain; though their whiteness and polish must not only produce a disagreeable reflection in sunshine, but be extremely slippery to walk on. The houses of the black merchants are for the most part extremely ill built and inconvenient; the window-lights small, and the apartments ill distributed. Some, however, make a better appearance if only one story high; but even the best of them have a certain meanness in the manner, and clumsiness in their execution, which renders the architecture contemptible in comparison of the European. There is one convenience, however, in all the houses of Bombay, *viz.* small ranges of pillars that support a pent-house or shed, forming what are called in the Portuguese language *verandas*, either all round the house, or on particular sides of it, which afford a pleasing shelter from the sun, and keep the inner apartments cool and refreshed by the draught of air under them. The pagodas, or temples of the Gentoos, are low mean buildings, having usually no light but what is admitted by the door; facing which is the principal idol. They imagine that a dark gloomy place inspires a kind of religious horror and reverence; and are very fond of having these pagodas among trees, and near the side of a tank or pond, for the sake of their frequent ablutions. These tanks are often very expensive; being generally square and surrounded with stone steps that are very convenient for the bathers.

10.
Habitants,
anners,
C. The natives of Bombay, though composed of almost every Asiatic nation, are shorter of stature and stronger than the inhabitants of the Coromandel coast. Here a palanquin which requires six men to carry it at Madras, or Fort St David, is carried by four. Here are some Perfecs, who, like their forefathers the ancient Persians, are followers of Zoroaster, who is said to have reduced into order the religion of the Persian magi; the fundamental maxim of which was the worshipping of one God under the symbol of light. They adore the sun, particularly when rising, with the most profound reverence and veneration; and likewise pay a kind of adoration to common fire. Mr Ives had once the opportunity of observing the manner in which they perform this devotion. A large brass pan was placed in the middle of the house with fire in it: before this fire, or rather on each side of it, two men were kneeling at their devotions, pronouncing their prayers with great rapidity. He was afterwards informed, that one of them was a priest, at that time on a visit to another priest in a fit of sickness. He was likewise informed, that the Perfecs have such a veneration for the fire, that they never put it out, or even breathe upon it; and he observed, that while the two priests were at their prayers over the pan of coals, they had a little white bib over their mouths, as he supposed to prevent their breath from approaching their favourite element. The prayers, however, from the simi-

larity of the sounds, appeared to him only to be a repetition of the same set of words. The visiting priest used many gestures with his hands over the fire, and afterwards stroaked down the face of the sick priest, which our author looked upon to be the final benediction, as the ceremony ended immediately.

As the Gentoos burn their dead, one would imagine that the Perfecs, who have such a veneration for fire, would be desirous of having their bodies consumed by that element; but instead of this, they expose their dead bodies to be devoured by birds of prey; because, say they, a living man is composed of all the elements; so that it is but reasonable, after he is dead, that every particular element should receive its own again. On the top of Malabar hill, about two miles from the town of Bombay, there are two round buildings for receiving the dead bodies of the Perfecs, which remain there till the bones are clean picked by the birds. This is certainly an abominable custom, and affords very shocking spectacles; however, a guard is always placed at a little distance to prevent people from prying too narrowly into these matters, or, as Mr Ives says, to ensure the vultures of their repast without any disturbance. Mr Grose tells us, that on his going to look into one of these repositories, a Perfec advised him in a friendly manner to let it alone, as no person, who was not a party concerned, would long survive such curiosity. He tells us also, that the person appointed to look after the dead, carefully observes which eye is first picked out by the birds, and from thence judge of the situation of the soul of the deceased; a state of happiness being indicated by the right eye being first picked out. Mr Ives observes, that by reason of the heat of the sun, much less noxious vapour is emitted by these bodies than might be expected; the flesh being soon shrivelled up, and the bones turning quite black.

At the extreme point of Malabar-hill there is a rock, on the descent to the sea, flat on the top, in which there is a natural crevice, which communicates with a hollow terminating at an exterior opening to the sea. This place is used by the Gentoos as a purifier from their sins. This purification is effected by their going in at the opening, and coming through the crevice, though it seems too small for people of any corpulence to pass.

In Bombay, and indeed in many other places of the East Indies, oxen are generally used instead of horses, not only for drawing carriages but for riding; and, however ridiculous such a practice may seem to us, it appears that they are not in this respect inferior to ordinary horses, being capable of going at the rate of seven or eight miles an hour. They are commonly of a white colour, with large perpendicular horns, and black noses. The only inconvenience that attends them, is, that, by being naturally subject to a lax habit of body, they sometimes incommode the rider with filth thrown upon him by the continual motion of their tails. In other respects they are far preferable to Indian horses, and will trot and gallop as naturally as the horses of this country. Admiral Watson, while at Bombay, was allowed a chaise drawn by two of these oxen by the East India Company. At the end of every stage the driver always put the near bullock in the place of the other; he then put his hand into both

Bomb
||
Bona.

their mouths, to take out the froth, without which precaution they would be in danger of suffocation.

For the History, Government, &c. of Bombay, see the articles *INDOSTAN*, and *East India COMPANY*.

BOMB KETCH, a small vessel built and strengthened with large beams for the use of mortars at sea.

BOMBUS, in music, an artificial motion with the hands, imitating in cadence and harmony the buzzing of bees. The word is originally Greek, and signifies the buz or noise of bees, gnats, and the like. In this sense, *bombus* made one of the species of applause used by the ancient auditories.

BOMBUS, in medicine, denotes a murmuring noise, as of wind breaking out of a narrow into a larger cavity, frequently heard in the thick intestines. The *bombus* heard in the ears, in acute diseases, is laid down by Hippocrates as a sign of death.

BOMBYLIUS, in zoology, a genus of insects belonging to the order of diptera. The rostrum is long, bristly, and bivalved; the bristles being fixed between the horizontal valves. There are five species, *viz.* 1. The major, with black wings. 2. The medius, with a yellowish body, white behind, and the wings spotted with yellow. 3. The minor, with unspotted wings. 4. The ater, has red wings, but a little blackish at the base; and green feet. The above four are natives of Europe. 5. The *capensis*, with the wings spotted with black, an ash-coloured body, and white behind. It is a native of the Cape of Good Hope.

BOMENE, a sea-port town of the United Provinces in Zealand, seated on the northern shore of the island of Schonen, opposite to the island of Goree, in E. Long. 4. 0. N. Lat. 51. 50.

BOMMEL, a town of Dutch Guelderland, situated on the northern shore of the river Waal, in E. Long. 5. 50. N. Lat. 52. 0.

BOMONICI, in Grecian antiquity, young men of Lacedæmon, who contended at the sacrifices of Diana which of them was able to endure most lashes; being scourged before the altar of this goddess.

BONA, by the Moors called *Balederna*, a sea-port town of the kingdom of Algiers in Africa, situated in E. Long. 7. 57. N. Lat. 36. 5. It was formerly rich, populous, capital of the province of the same name under the kingdom of Constantina, and is supposed by some to be the ancient Hippo, once the seat of the great St Austin, and a sea-port built by the Romans. The inhabitants, however, deny it to be the ancient Hippo, which had been so often taken, retaken, and destroyed by the wars; and pretend it to be since rebuilt at the distance of two or three miles from the ancient Hippo, out of its ruins, and called *Baleed-el-Ugned*, from a fort of trees of that name that grow in the neighbourhood. It is now a very mean place, poorly built, and thinly inhabited, with scarce any traces of its former grandeur, except the ruins of a cathedral, or as others guess, of a monastery built by St Austin about three miles distance from the city. Near these ruins is a famed spring called by his name, much resorted to by the French and Italian sailors, who come to drink of its waters, and pay their devotions to a maimed statue said also to belong to the saint, but so mutilated that no traces either of face or dress are remaining; and as each of them strives to break off some splinter, or to scrape off some part of it on account of

its supposed sanctity, it will probably be soon reduced to a state of non-existence. Bona was taken by the pirate Barbarossa, and joined to his new kingdom of Algiers; but as quickly lost, and recovered by its old masters the Tuniseens, who soon after lost it again. It is commanded by a little fort, in which is a garrison of about 300 Turks, under the command of an aga, who is also governor of the town. The road for the ships is good for nothing before the town, but a little farther west is very deep and safe. Dr Shaw tells us, that the continual discharging of ball into the road, and the neglect of cleansing the port which came to the very walls, is the cause of both becoming so unsafe and uncommodious; though this might be easily remedied so as to make the town one of the most flourishing in all Barbary.

Bona Dea, the good goddess, in Pagan mythology, one of the names of Cybele. Others say, she was a Roman lady, the wife of one Faunus, and was famous for her chastity, and that after her death she was deified. Her sacrifices were performed only by matrons; and in so secret a manner, that it was no less than death for any man to be present at the assembly (see *CYBELE*). Cicero reproaches Clodius with having entered into this temple disguised as a singing woman, and having by his presence polluted the mysteries of the good goddess. What kind of mysteries these were, we may learn from Juvenal, Sat. VI 313. The poet then mentions the adventure of Clodius.

*Atque utinam ritas victores, et publica saltem
His intacta malis agerentur sacra: sed omnes
Noverunt Marci, atque Iuli, que psalteria perenni
Mijorem, quam sint duo Cæsaris Anticatones,
Illuc testiculi sibi conscius, unde fugit mus,
Intulerit.*

I with-at least our sacred rites were free
From these pollutions of obscenity:
But 'tis well known what finger, how disguis'd,
A lewd audacious action enterpris'd:
Into the sanctuary, with women mix'd, he went,
Arm'd with a huge two-handed instrument;
A grateful present to these holy choirs,
Where the mouse, conscious of his sex, retires.

DRYDEN.

Bona Fides, in law. When a person performs any action which he believes at the time to be just and lawful, he is said to have acted *bona fide*.

Bona Mobilia, the same with moveable effects or goods.

Bona Notabilia, are such goods as a person dying has in another diocese than that wherein he dies, amounting to the value of 5 l. at least; in which case the will of the deceased must be proved, or administration granted in the court of the archbishop of the province, unless by composition or custom, any dioceses are authorized to do it, when rated at a greater sum.

Bona Patria, an assize of countrymen or good neighbours, where 12 or more are chosen out of the country to pass upon an assize, being sworn judicially in the presence of the party.

Bona Peritura, perishable goods. By stat. 13. Ed. I. cap. 4. the cargo of a ship that has been cast away shall be kept for a year and a day, and restored to the rightful owner; but if the goods be such as will not endure

Bona.

Bonaire
||
Bond.

so long, they are *bona peritura*, which the sheriff is allowed to sell, and to account in money for the value.

Bona Vacantia, goods; such as royal-fish, shipwrecks, treasure trove, waifs, and estrays, in which no one can claim a property. These goods by the law of nature, and by the imperial law, belonged to the first occupant or finder; but in the modern constitutions of European governments, they are annexed to the supreme power by the positive laws of the state.

BONAIRE, an island of South America, near the north coast of Terra Firma. It belongs to the Dutch; and abounds in kabritoes and salt. W. Long. 66. 18. N. Lat. 20. 16.

BONAIIS, very high mountains of Italy, in the duchy of Savoy, not far from Lafforeburg: in some seasons they cannot be ascended without great danger.

BONARELLI (Gui Ubaldo), an Italian count. He was intrusted with several important negotiations, and was esteemed an able politician and learned philosopher. He was the author of a fine Italian pastoral, intitled, *Filli di Sciro*. He died at Fano, in 1608, aged 45.

BONAVENTURA (the bay of), in America, on the coast next the South Sea, in the Popayan. It has a port and harbour for ships; but the air is very unwholesome. W. Long. 75. 18. N. Lat. 3. 20.

BONAVENTURE, a celebrated cardinal, called, from his works, the *seraphic doctor*. He was born at Bagnarea, a small town of Tuscany, in 1221; and his original name was *John Fidanza*. He took the habit of a monk of the order of St Francis in 1243, became doctor of Paris in 1255, and the next year general of his order. After the death of Clement IV. the cardinals disagreeing about the election of a new pope, engaged themselves by a solemn promise to elect him who should be named by Bonaventure, even though it should be himself; but he chose Theobald archdeacon of Liege, who was then in the Holy Land, and took the name of *Gregory X*. This pope, in return, in 1272, made him cardinal and bishop of Alba, and ordered him to assist at the second general council of Lyons, where he died in 1274. His works were printed at Rome in 8 vols folio.

BONAVISTA, an island in the Atlantic ocean, the most easterly and first discovered of the Cape de Verd islands. It is 20 miles long, and 13 broad; has plenty of goats and cotton, and some indigo. The inhabitants are remarkable for slothfulness; they have a town and two roads where ships come to an anchor. W. Long. 23 6. N. Lat. 16. 5.

BOND (John), a commentator on Horace and Persius, was born in Somersetshire in the year 1550, and educated at Winchester school. In 1569 he was entered a student of the university of Oxford, probably in the New college, of which he became either one of the clerks or one of the chaplains. He took his bachelor of arts degree in 1573, and that of master in 1579; soon after which he was appointed by his college, master of the free school in Taunton in Somersetshire. In this employment he continued many years with great reputation; but being at length weary of his laborious employment, he commenced physician, and we are told became eminent in that capacity. He died in the year 1612, possessed of several lands and

tenements in his neighbourhood; but whether acquired by the practice of physic, does not appear. He wrote, 1. *Commentarii in pœmata Q. Horatii*, 8vo. 2. *Commentarii in sex satyras Persii*, Lond. 1614, 8vo.

BOND, in law, is a deed whereby the obligor obliges himself, his heirs, executors, and administrators, to pay a certain sum of money to another at a day appointed. If this be all, the bond is called a simple one, *simplex obligatio*. But there is generally a condition added, that if the obligor does some particular act, the obligation shall be void, or else shall remain in full force: as payment of rent; performance of covenants in a deed; or repayment of a principal sum of money borrowed of the obligee, with interest; which principal sum is usually one half of the penal sum specified in the bond. In case this condition is not performed, the bond becomes forfeited, or absolute at law, and charges the obligor while living; and after his death the obligation descends upon his heir, who (on defect of personal assets) is bound to discharge it, provided he has real assets by descent as a recompense.

If the condition of a bond be impossible at the time of making it, or be to do a thing contrary to some rule of law that is merely positive, or be uncertain, or insensible, the condition alone is void, and the bond shall stand single and unconditional: for it is the folly of the obligor to enter into such an obligation from which he can never be released. If it be to do a thing that is *malum in se*, the obligation itself is void: for the whole is an unlawful contract, and the obligee shall take no advantage from such a transaction. And if the condition be possible at the time of making it, and afterwards becomes impossible by the act of God, the act of law, or the act of the obligee himself, there the penalty of the obligation is saved: for no prudence or foresight of the obligor could guard against such a contingency. On the forfeiture of a bond, or its becoming single, the whole penalty was recoverable at law: but here the courts of equity interposed, and would not permit a man to take more than in conscience he ought, *viz.* his principal, interest, and expences, in case the forfeiture accrued by non-payment of money borrowed; the damages sustained upon non-performance of covenants; and the like. And the statute 4 and 5 Ann. c. 16. hath also enacted, in the same spirit of equity, that in case of a bond, conditioned for the payment of money, the payment or tender of the principal sum due, with interest and costs, even though the bond be forfeited and a suit commenced thereon, shall be a full satisfaction and discharge.

BOND, in masonry and brick-laying, is when bricks or stones are as it were knit and interwoven; and when they lay, make *good bond*, they mean that the joints are not made over, or upon other joints; but reach at least six inches, both within the wall and on the surface, as the art of building requires.

BONDAGE, properly signifies the same with slavery, but in old law books is used for villenage (see VILLENAGE). Tenants in bondage paid kenots, and did fealty; they were not to fell trees in their own garden, without licence of the lord. The widow of a tenant in bondage held her husband's estate *quæ si vixerit sine marito*, "as long as she lived single."

BONDAGE by the Forelock, or *bindagium per antea*, *eres crines capiti*, was when a freeman renounced his

Bond,
Bondage.

Bondman
||
Bones.

liberty, and became slave to some great man: which was done by the ceremony of cutting off a lock of hair from the forehead, and delivering it to his lord; denoting that he was to be maintained by him for the future. Such a bondman, if he reclaimed his liberty, or were fugitive from his master, might be drawn again to his servitude by the nose; whence the origin of the popular menace to pull a man by the nose.

BONDMAN, in the English law, is used for a villain, or tenant in villenage*.—The Romans had two kinds of bond men; one called *servi*, who were those either bought for money, taken in war, left by succession, or purchased by some other lawful acquisition; or else born of their *bondwomen*, and called *vernae*. We may add a third kind of bondmen mentioned by Justinian, called *adscriptii gl'bae*, or *agricensili*; who were not bound to the person, but to the ground or place, and followed by him who had the land. These in our law are called *villains regardants*, as belonging to the manor or place.

* See *III. Law and III. 1. 225.*

BONE-ACE, a game at cards played thus: The dealer deals out two cards to the first hand, and turns up the third, and so on through all the players, who may be seven, eight, or as many as the cards will permit: he that has the highest card turned up to him carries the bone; that is, one half of the stake; the other half remaining to be played for. Again, if there be three kings, three queens, three tens, &c. turned up, the eldest hand wins the bone. But it is to be observed, that the ace of diamonds is bone-ace, and wins all other cards whatever. Thus much for the bone: and as for the other half of the stake, the nearest to 31 wins it; and he that turns up or draws 31 wins it immediately.

BONES, their origin, formation, composition, texture, variety, offices, &c. See **ANATOMY**, Part I.

From a discovery made by Mr Scheele, of a method of producing the phosphoric acid in large quantity from bones, it has been asserted, that this acid is naturally contained in the bones, united with a calcareous earth. From many experiments, however, it appears that no acid is naturally contained in calcined bones; nor can the acid of phosphorus be extracted from them but by means of the vitriolic acid: whence it seems probable, that the phosphoric acid in this case is produced by the combination of a certain quantity of earth with the vitriolic acid.—With regard to the earth of bones itself, it appears to be very different from the calcareous kind: it is much more soluble in the vitriolic acid, and may be precipitated from that or any other by means of the caustic volatile alkali, which cannot be done with the calcareous earth.

BONES Whitened for Skeletons. Two processes are described in the *Acta Hoffnienfis* for whitening bones. Professor Rau had a method of giving them a great degree of whiteness. By bare exposure to the air, sun, and rain, for a length of time, they become notably white; but the whitest bones, kept in rooms tainted with smoke or fuliginous vapours, grow in a little time yellowish, brownish, and unsightly. It is customary for the purification of bones, to boil them in alkaline liquors; which, by dissolving and extracting the superfluous fat, improve their whiteness.

BONES Hardened and Softened. Boerhaave observes,

that alkaline salts render bones harder and firmer, and that acids make them softer and more flexible. These effects succeed in certain circumstances, but not universally; for bones may be hardened and softened both by acids and by alkalis, according to the quantity of saline matter employed, and the manner in which it is applied. Newmann made bones harder and more compact by treating them with the strongest of the mineral acids; though, when the acid is in sufficient proportion, it destroys or dissolves them. In Papin's digester (a strong close vessel, in which the steam of boiling liquors is confined, and the fluid by this means made to undergo a greater degree of heat than it could otherwise sustain), the hardest bones are reduced in a short time, by the action of simple water, into a soft pap or jelly; and alkaline liquors produce this effect still sooner.

In the history of the French Academy for the years 1742 and 1743, there is an account that Mr Geoffroy produced before the academy a small ivory spoon, which, by long lying in mustard, was become flexible and transparent like horn; that Mr Fouchy saw an ivory spoon, which, by lying for a considerable time in milk, was become supple like leather; and that Mr Humauld produced bones, which had been softened by sleeping in vinegar, afterwards hardened to their natural state by sleeping in water, and softened a second time by sleeping in vinegar. Dr Lewis observed that the nitrous and marine acids diluted, and the acetous acid, make bones flexible and tough like leather; but that the diluted vitriolic acid, though it renders them notably soft, makes them at the same time brittle. It seems as if a great part of the earthy matter, which is the basis of the bone, and on which its hardness depends, was dissolved and extracted by the three first; whilst the latter, incapable of dissolving this kind of earth into a liquid form, only corrodes it into a kind of selenitic concrete, which remains intermixed in minute particles among the gelatinous matter. Dr Lewis did not find that the softened bones, whatever acid they were softened by, recovered their hardness by sleeping in water. Slips of softened ivory, after lying above a month in water, continued nearly as soft as when they were taken out of the acid liquor.

There is a singular induration of bones produced by fire; the effects of which agent are here remarkably different according to its degree and the circumstances of its application. Bones exposed to a moderate fire, either in open vessels, or in contact with the burning fuel, become opaque, white, and friable throughout; and an increase of fire, after they have once suffered this change, renders them only more and more friable. But if they are urged at first with a strong fire, such as that in which copper or iron melts, they become hard, semitransparent, and sonorous, like the hard mineral stones. This curious experiment deserves to be further prosecuted.

Colouring of BONES. Bones may be stained of a variety of colours by the common dyeing infusions and decoctions of animal and vegetable substances. They are stained also, without heat, by metallic solutions; and by means of these may be spotted or variegated at pleasure. Thus, solution of silver in aquafortis gives a brown or black according to its quantity; solution of gold in aqua regia, or in spirit of salt, a fine purple;

Bones.

Bones. ple; solution of copper in the acetic acid, a fine green; and solutions of the same metal in volatile alkalis, a blue, which at first is deep and beautiful, but changes, upon exposure to the air, into a green or bluish-green. If the bone is but touched with the two first solutions, and exposed to the air, it does not fail to acquire the colour in a few hours: In the two latter, it requires to be steeped for a day or longer in order to its imbibing the colour. In these and other cases where immersion for some time is necessary, the bone may be variegated, by covering such parts as are to remain white, with wax or any other matter that the liquor will not dissolve or penetrate.

Oeconomical Uses of Bones. Bones are a very useful article, not only for making different kinds of toys, but likewise in several of the chemical arts; as, For making cast iron malleable, for absorbing the sulphur of sulphureous ores; for forming tests and cupels, or vessels for refining gold and silver with lead (burnt bones composing a mass of a porous texture, which absorbs the vitrified lead and other matters, while the unvitrescible gold and silver remain entire behind); for the preparation of milky glasses and porcelains; for the rectification of volatile salts and empyreumatic oils; and for making glue. The bones of different animals are not equally fit for these uses: even the glue, or gelatinous part of the bones of one animal is notably different both in quantity and cohesiveness from that of another.

The human skull-bone, or cranium, the natural defence of the seat of sensation and perception in the noblest animal, has been recommended medicinally as a cure for epileptics, deliria, and all disorders of the senses, from the same philosophy which ascribed anti-asthmatic virtues to the lungs of the long-winded fox; and expected, because fowls are said to digest even small bones, that the skin of the gizzard, dried and powdered, would produce a similar effect in the human stomach. To such lengths of extravagance have the sons of physic been carried by the blind superstition of former ages!

BONES in the Funeral Solemnities of the Ancients.— Divers usages and ceremonies relating to the bones of the dead have obtained in different ages; as gathering them from the funeral pile, washing, anointing, and depositing them in urns, and thence in to tombs; translating them, which was not to be done without the authority of the pontiffs; not to say worshipping of them, still practised to the bones of the saints in the Romish church. Among the ancients, the bones of travellers and soldiers dying in foreign countries were brought home to be buried; till, by an express S. C. made during the Italic war, it was forbid, and the soldiers bodies ordered to be buried where they died.

The Romans had a peculiar deity under the denomination of *Osiaque*, to whom the care of the induration and knitting of the human bones was committed; and who, on that account, was the object of the adoration of all breeding women.

Fossil or Petrified Bones, are those found in the earth, frequently at great depths, in all the strata, even in the bodies of stones and rocks; some of them of a large size, usually supposed to be the bones of giants, but more truly of elephants or hippopotami. It is supposed they were repositied in those strata when

all things were in a state of solution; and that they incorporated and petrified with the bodies where they happened to be lodged.

In the museum of the Russian Academy of Sciences, there is a vast collection of fossil bones, teeth, and horns, of the elephant, rhinoceros, and buffaloes, which have been found in different parts of the empire, but more particularly in the southern regions of Siberia. Naturalists have been puzzled to account for so great a variety being found in a country where the animals of which they formerly made a part were never known to exist. It was the opinion of Peter, who, though he deserves to be esteemed a great monarch, was certainly no great naturalist, that the teeth found near Voronez were the remains of elephants belonging to the army of Alexander the great, who, according to some historians, crossed the Don, and advanced as far as Kostinka. The celebrated Bayer, whose authority carries greater weight in the literary world, conjectures, that the bones and teeth found in Siberia belonged to elephants common in that country during the wars which the Mongul monarchs carried on with the Persians and Indians; and this plausible supposition seems in some measure to be corroborated by the discovery of the entire skeleton of an elephant in one of the Siberian tombs. But this opinion, as Mr Pallas † very justly observes, is sufficiently refuted by the consideration, that the elephants employed in the armies of all India could never have afforded the vast quantities of teeth which have been discovered, not to mention those which it is justly to be presumed may still be buried. They have been already dug up in such plenty as to make a considerable article of trade. The same ingenious naturalist has given an ample description of these fossil bones, and has endeavoured to account for their origin. Upon examining those in the museum, he was led to conclude, that as these bones are equally dispersed in all the northern regions of Europe, the climate probably was in the earlier ages less severe than at present, and then possibly sufficiently warm to be the native countries of the elephant, rhinoceros, and other quadrupeds, now found only in the southern climates. But when he visited, during his travels, the spots where the fossil bodies were dug up, and could form a judgment from his own observations, and not from the accounts of others, he renounced his former hypothesis; and, in conformity with the opinions of many modern philosophers, asserted, that they must have been brought by the waters; and that nothing but a sudden and general inundation, such as the deluge, could have transported them from their native countries in the south, to the regions of the north. In proof of this assertion, he adds, that the bones are generally found separate, as if they had been scattered by the waves, covered with a stratum of mud evidently formed by the waters, and commonly intermixed with the remains of marine plants, and similar substances; instances of which he himself observed during his progress through Siberia, and which sufficiently prove that these regions of Asia were once overwhelmed with the sea.

We often find in the earth petrified bones, the greatest part of their gelatinous matter being extracted by the moisture, and a stony one introduced in its room. In some parts of France petrified bones are met with

† *Nov. Gen. De Ossibus Sibericis Fossilibus*, p. 247.

Bones
Bonfadio.

which have an impregnation of copper. Hence, on being calcined in an open fire, a volatile salt is produced from the remains of their gelatinous principle, and the bone is tinged throughout of a fine greenish-blue colour, copper always striking a blue with volatile alkalis. The French turcoise stones are no other than these bones prepared by calcination: they are very durable, and bear to be worked and polished nearly in the same manner as glass; without the imperfection, inseparable from glassy bodies, of being brittle. See the article TURCOISE.

There have been lately discovered several enormous skeletons, five or six feet beneath the surface, on the banks of the Ohio, not far from the river Miume in America, 700 miles from the sea-coast. Some of the tusks are near seven feet long; one foot nine inches at the base, and one foot near the point; the cavity at the root or base, 19 inches deep. Besides their size, there are several other differences which will not allow the supposition of their having been elephants: the tusks of the true elephant have sometimes a very slight lateral bend; these have a larger twist, or spiral curve, towards the smaller end; but the great and specific difference consists in the shape of the grinding teeth; which, in these newly found, are fashioned like the teeth of a carnivorous animal; not flat and ribbed transversely on their surface like those of the modern elephant, but furnished with a double row of high and conic processes, as if intended to masticate, not to grind, their food. A third difference is in the thigh-bone, which is of great disproportionable thickness to that of the elephant; and has also some other anatomical variations. These fossil bones have been also found in Peru and the Brazils; and when cut and polished by the workers in ivory, appear in every respect similar. It is the opinion of Dr Hunter, that they must have belonged to a larger animal than the elephant; and differing from it, in being carnivorous. But as yet this formidable creature has evaded our search; and if, indeed, such an animal exists, it is happy for man that it keeps at a distance; since what ravage might not be expected from a creature, endowed with more than the strength of the elephant, and all the rapacity of the tiger? See MAMMOTH.

BONE-SPAIN. See FARRIERY, § XXVI.

BON-ESPERANCE, the same with the Cape of Good Hope. See GOOD HOPE.

BONET (Theophilus), an eminent physician born at Geneva, March 15th 1620. He took his degree in physic in 1643, after he had gone through most of the famous universities, and was for some time physician to the duke of Loagneville. Mean while his skill in his profession got him considerable practice; but being seized with deafness, it obliged him to retire from business, which gave him leisure to collect all the observations he had made during a practice of 40 years. He wrote, 1. *Polyastes, sive Thesaurus Medico-practico*, 3 vols folio. 2. *Labyrinthe Medici extricati*. 3. *Medicini Septentrionalis Collatitia*: and other works.

BONFADIO (James), one of the most polite writers of the 16th century, was born in Italy, near the lake Garda. He was secretary to the cardinal de Bari, and after his death to the cardinal Ghinucci. He afterwards read public lectures on Aristotle's politics, and on rhetoric; and was made historiographer to the re-

public of Genoa. He applied himself to compose the annals of that state, in which he wrote too satirically on some families. This creating him enemies who were resolved to ruin him, they accused him of the unnatural sin; and, as witnesses were found to convict him of it, he was condemned to be burnt. Some say that this sentence was executed; and others, that his punishment was changed, and that he was beheaded. This was in the year 1560. Upon the day of his execution he wrote a note to John Baptist Grimaldi, to testify his gratitude to the persons who had endeavoured to serve him; and promised to inform them how he found himself in the other world, if it could be done without frightening them. But it does not appear that he performed his promise, any more than the many who had promised the like before him.—His history of Genoa is esteemed. We have also some letters, some orations, and Latin and Italian poems, of his, which were printed at Bologna in the year 1744, octavo.

BONFINIUS (Anthony), flourished in the 15th century. He was a native of Ascoli in Italy, and attached himself to the study of the belles lettres. Matthias Cowin king of Hungary, having heard of his learning, sent for him, retained him, and settled upon him a pension. He wrote, 1. A history of Ascoli; 2. A treatise of virginity and conjugal chastity; 3. An history of Hungary; and other works.

BONFREMIUS (James), a learned Jesuit, born at Dinant, in 1573. He wrote a commentary on the Pentateuch, and learned notes on the Onomasticon of the places and towns mentioned in the Scripture. He died at Tournay in 1643, aged 70.

BONGARS (James), in Latin *Bongarsias*, a native of Orleans, was one of the most learned men of the 16th century. He applied himself to the study of critical learning, and was for near 30 years employed in the most important negotiations of Henry IV. whose resident he was several times at the courts of the princes of Germany, and at length his ambassador. He was of the Protestant religion; and, when very young, had the courage to write and post up in Rome a very spirited answer to a bull of Pope Sixtus V. The public is obliged to him for the edition of several authors who have written the History of the expeditions to the Holy Land; he also published, among other works, an edition of Justin, in which he restored several passages that had been corrupted, by consulting valuable manuscripts, and added notes which explained many difficulties. He died in 1612, aged 58.

BONIFACE, the name of several eminent men, particularly of nine popes. To the first of these, who was chosen pope in 418, St Augustine dedicated his four books against the two epistles of the Pelagians. The third of that name prevailed upon the emperor Phocas to consent that the title of *Universal Bishop* should be conferred on no other than the bishop of Rome. Boniface IV. obtained from the same emperor, the pantheon, a famous heathen temple built by Agrippa, and converted it into a church which is now called "Our Lady della Rotunda." Several works are also attributed to him, but they appear to be spurious. Boniface VII. hath the title of *antipope*; because in 974 he caused Benedict VI. to be strangled in prison, and after the election of Benedict VII. removed the treasures of the church to Constantinople. He, however,

Bonfinius
Boniface

Boniface
||
Bonner.

however, at length returned after the death of Benedict, and caused his successor John XIV. to be murdered; but died himself soon after, and was dragged naked by the feet about the streets. Boniface VIII. canonized St Lewis in 1297, and in 1300 appointed the jubilee to be solemnized every 100 years after.

BONIFACE is also the name of a saint, who before he took that name was called *Winfred*, and was born at Kinton in Devonshire. He chose to go and preach the gospel among the barbarous nations; and though created archbishop of Mentz, soon after resigned his office, to go and preach in East Friesland, where he was killed by the Pagans on the 5th of June 754. His letters were published by Senarius.

BONIFACIO, a town in the island of Corsica, beyond the mountains, near the strait called *Bocca di Bonifacio*. It is well fortified, and pretty populous. E. Long. 9. 20. N. Lat. 41. 25.

BONIS NON AMOVENDIS, in law, is a writ directed to the sheriffs of London, &c. charging them, that a person against whom judgment is obtained, and prosecuting a writ of error, be not suffered to remove his goods until the error is determined.

BONITO, in ornithology. See SCOMBER.

BONN, an ancient and strong city of Germany, in the Electorate of Cologne, and the usual residence of the elector. It is of great consequence in the time of war; because it is situated on the Rhine, in a place where it can stop every thing that comes down that river. It is well fortified by the elector, who has a fine palace and beautiful gardens in the city. E. Long. 7. 5. N. Lat. 50. 44.

BONNA, (anc. geog.), one of the 50 citadels built by Drusus on the Rhine; supposed by some to be the same with the *Ara Ubiorum*: now *Bonn*.

BONNEFONS (John), a Latin poet born at Clermont in Auvergne, and lieutenant-general of Bar sur Seine, acquired great reputation by his *Pancharis*, and other poems. He died under the reign of Lewis XIII. He ought not to be confounded with John Bonnefons his son, another Latin poet.

BONNER (Edmund), bishop of London, of infamous memory, was born at Hanky in Worcestershire, and generally supposed to be the natural son of one Savage a priest; and that priest was the natural son of Sir John Savage of Clifton in the same county. Strype, however, says, he was positively assured that Bonner was the legitimate offspring of a poor man, who lived in a cottage known to this day by the name of *Bonner's place*. About the year 1512, he entered student of Broadgate Hall in Oxford. In 1519, he was admitted bachelor of the canon and civil law. About the same time he took orders, and obtained some preferment in the diocese of Worcester. In 1525, he was created doctor of canon law. Having now acquired the reputation of a shrewd politician and civilian, he was soon distinguished by cardinal Wolsey, who made him his confidant, and heaped upon him a variety of church-preferments. He possessed at the same time the livings of Blyndon and Cherry-Burton in Yorkshire, Ripple in Worcestershire, cast Dereham in Norfolk, prebend of St Paul's, and the archdeaconry of Leicester. Bonner was with the cardinal at Caw-wood, when he was arrested for high treason. After the death of that minister, he soon found means

to insinuate himself into the favour of Henry VIII. who made him one of his chaplains, and employed him in several embassies abroad, particularly to the pope. In 1532, he was sent to Rome, with Sir Edward Kame, to answer for the king, whom his Holiness had cited to appear in person or by proxy. In 1533, he was again dispatched to pope Clement VII. at Marseilles, upon the excommunication of king Henry on account of his divorce. On this occasion he threatened the pope with so much resolution, that his Holiness talked of burning him alive, or throwing him into a caldron of melted lead; upon which Bonner thought fit to decamp. His infallibility did not foresee that the man whom he thus threatened was predestined to burn heretics in England.

In 1538, being then ambassador at the court of France, he was nominated bishop of Hereford; but, before consecration, was translated to the see of London, and enthroned in April 1540.—Henry VIII. died in 1547. at which time Bonner was ambassador with the emperor Charles V. During this reign he was constantly zealous in his opposition to the pope; and, in compliance with the king, favoured the reformation. Henry VIII. was not to be trifled with; but, on the accession of young Edward, Bonner refused the oath of supremacy, and was committed to the fleet; however, he soon thought fit to promise obedience to the laws, and was accordingly released. He continued to comply with reformation; but with such manifest neglect and reluctance, that he was twice reprimanded by the privy council, and in 1549, after a long trial, was committed to the Marshalsea, and deprived of his bishopric. The succeeding reign gave him ample opportunity of revenge. Mary was scarce seated on the throne before Bonner was restored to his bishopric; and soon after appointed vicegerent and president of the convocation. From this time he became the chief instrument of papal cruelty: he is said to have condemned no less than 200 Protestants to the flames in the space of three years. Nor was this monster of a priest more remarkable for his cruelty than his impudence. When Queen Elizabeth came to the crown, he had the insolence to meet her, with the rest of the bishops, at Highgate. In the second year of her reign, refusing to take the oath of allegiance and supremacy, he was again deposed, and committed to the Marshalsea; where he died in 1569, after ten years confinement. There cannot be a stronger instance of the comparative lenity of the Protestant church, than its suffering this miserable man to die a natural death. Several pieces were published under his name.

BONNESTABLE, a town of Le Maine in France, which carries on a great trade in corn. E. Long. 6. 30. N. Lat. 48. 11.

BONNET, in a general sense, denotes a cover for the head, in common use before the introduction of hats. Bonnets are still used in many parts of Scotland.

BONNET, in fortification, a small work consisting of two faces, having only a parapet with two rows of palisades, of about 10 or 12 feet distance; it is generally raised before the salient angle of the counterescarp, and has a communication with the covered way, by a trench cut through the glacis, and palisades on each side.

Bonnet à Pretre, or *Priest's Bonnet*, in fortification, is an out-work, having at the head three salient

Bonner
||
Bonner.

Bonnet
||
Bononcini

angles, and two inwards. It differs from the double tenail only in this, that its sides, instead of being parallel, are like the *queue d'aronde*, or swallow's tail, that is, narrowing, or drawing close at the gorge, and opening at the head.

BONNET, in the sea-language, denotes an addition to a sail; thus we say, lace on the bonnet, or shake off the bonnet.

BONNEVAL (Claudius Alexander count de), known in the latter part of his life by the name of *Osman Bashaw*, descended from a family related to the blood royal of France, entered himself at the age of 16 in the service of that crown, and married the daughter of marshal de Biron. He made the campaign in Flanders in 1690; but soon after left the French army, and entered into the imperial service under prince Eugene, who honoured him with an intimate friendship. The intrigues of the marquis de Prié, his inveterate enemy, ruined his credit, however, at the court of Vienna, and caused him to be banished the empire. He then offered his service to the republic of Venice and to Russia; which being declined, his next tender was to the Grand Signor, who gladly received him: it was stipulated, that he should have a body of 30,000 men at his disposal; that a government should be conferred on him, with the rank of Bashaw of three tails, and a salary of 10,000 aspers a-day; and that, in case of a war, he should be commander in chief. The first expedition he engaged in after his arrival at Constantinople, was to quell an insurrection in Arabia Petraea, which he happily effected; and at his return had large offers made him by Kouli Khan, but he did not choose to accept them. Some time after, he commanded the Turkish army against the emperor, over whose forces he gained a victory on the banks of the Danube. But success does not always protect a person against disgrace; for Bonneval, notwithstanding his service, was first imprisoned, and then banished to the island of Chio. The sultan, however, continued his friend; and the evening before his departure made him Bashaw-general of the Archipelago, which, with his former appointment of beglerbeg of Arabia, rendered him one of the most powerful persons in the Ottoman empire. In this island he found a retirement quite agreeable to his wishes; but did not long enjoy it, being sent for back, and made *topigi* or master of the ordnance, a post of great honour and profit. He died in this employment, aged 75, in 1747; and wrote the memoirs of his own life.

BONNEVAL, a town of France, in Beauce, with a fine Benedictine abbey. It is seated on the river Loire, in E. Long. 1. 30. N. Lat. 48. 10.

BONNEVILLE, a town of Savoy, situated on the north side of the river Arve, and subject to the king of Sardinia. E. Long 6. 10. N. Lat. 46. 18.

BONNY, among miners, a bed of ore, differing only from a squat as being round, whereas the squat is flat. See SQUAT.

BONNY, a town of France, in the Gatinois, seated at the confluence of a river of the same name with the Loire. E. Long. 2. 54. N. Lat. 47. 36.

BONONCINI (Giovanni), an eminent composer of music, for some time divided the opinions of the *connoisseurs* of this kingdom with respect to the comparative merits of himself and the great Handel, which gave

occasion for the following epigram, said to have been written by Dr Swift:

Bononia
||
Bontia.

Some say that Signior Bononcini
Compar'd to Handel's a meer ninny;
Others aver, that to him Handel
Is scarcely fit to hold the candle.
Strange! that such high disputes should be
'Twi'x *Tweedle Dum* and *Tweedle Dee*.

There is one opera (Italian) published with his name prefixed to it, intitled *Pharnaces*; but whether the words, or only the music, are his composition, is uncertain; and indeed, in the general, the language of those pieces written merely for musical representation, is so extremely paltry, and so opposite to every thing that can be deemed poetry, that the greatest compliment that can be paid to the authors of them is, to suffer their names to lie buried in the shades of obscurity.

BONONIA, (anc. geog.), a town of Gallia Belgica, supposed to be the *Portus Iccius* of Cæsar, and the *Gessoriacum* of Mela, and to have had three different names, (Cluverius). Peutinger's map expressly calls Gessoriacum *Bononia*. Now *Boulogne*. E. Long. 1. 30. Lat. 50. 40.

BONONIA, a town of Italy, in the Gallia Cispadana; a name probably given by the Gauls, there being a *Bonnia* in Gallia Belgica. Its ancient name, when in the hands of the Tuscan, who were expelled by the Gauls, was *Faljina*. In the 563d year of the city the Romans led a colony thither; which, about the beginning of the Asiatic war, was increased by Augustus, and is the *Colonia Bononiensis* of Tacitus. Now *Bologna*; which see.

BONONIA, a town of Pannonia Inferior, between Mursa to the north-west, and Taurinum to the east.—Another Bononia, a town of Mœsia Superior, on the Danube; now *Bodon* in Bulgaria. See BODON.

BONONIAN. See BOLONIAN.

BONOSIANI, or BONOSIACI, an ancient branch of *Adoptiani*, in the fourth century, denominated from their leader Bonosus, a bishop of Macedonia. The Bonosiani were prior to the Feliciani, and even to Neitorius; whence some rather consider them as a branch of Arians. They allowed Christ to be no otherwise the Son of God than by adoption.

BONPOURNICKEL, a coarse kind of bread used in Westphalia. See BREAD.

BONS-HOMMES, or *Bon-hommes*, a sort of hermits of St Augustin, founded by F. de Paula. They were brought over into England in 1283, by Edmund earl of Cornwall, and settled at Ashorug in Bucks, besides which they had only one house more at Edingdon in Wiltshire. They followed the rule of St Austin, and wore a blue habit.—The name is said to have arisen from Lewis XI. of France, who used to call F. de Paula, prior of the order, *Le bon homme*. Till then they had been called the *Minimi*, or the order of Grammont. See ALBIGENSES.

BONTIA, WILD OLIVE OF BARBADOES: A genus of the angiosperma order, belonging to the didynamia class of plants; and in the natural method ranking under the 40th order, *Perforata*. The calyx is quinquepartite; the corolla is bilabiate, the inferior lip tripartite and revolute; the plum is ovate and monospermous, with the apex turned to one side.

Bonvincino Of this genus there are two species, the daphnoides and the germinans. The first hath a woody stem and branches; rising to the height of ten feet, with narrow, smooth, thickish leaves, crenated at the edges; and flowers from the sides of the branches, succeeded by large oval fruit that sometimes ripen in England. This species is greatly cultivated in the gardens at Barbadoes for making of hedges; for which purpose it is exceedingly proper, it being an evergreen of very quick growth. It is said, that from cuttings planted there in the rainy season, when they have immediately taken root, there has been a complete hedge, four or five feet high, in 18 months. The second sort has been reckoned by many botanic writers to be a species of the mangrove tree, as it grows in swamps, which they also do. It rises 14 or 16 feet high, sending out several small branches which incline downward toward the water, and as soon as they reach that, put out roots into the mud, whereby they propagate very fast: these branches are garnished with leaves placed opposite; they are of a thick substance like those of the bay tree about two inches long and one broad, very smooth on their surface: the flowers are white, and come out in spikes from the upper branches. This hath been also by some supposed to be the plant which produces the *Malacca-BEAN* formerly kept in the shops. These plants are easily propagated, either by seeds or cuttings, sown or planted on a hot-bed; but they must be kept constantly in the stove.

BONVINCINO, called **Le MORETTO**, (Alessandro), history and portrait painter, was born at Rovate in 1514. He was first the disciple of Titian, under whose direction he studied diligently for some years. But, having accidentally seen the designs of Raphael, he felt an elevation of mind that he never had before experienced. He therefore gave himself up entirely to study those master-pieces of art and genius; and his observations were guided with such judgment, as well as attention, that his improvement was truly surprising, and he became an exceeding good painter. His works were eagerly bought up, as being extremely admired for the tenderness of the penciling; for the correctness, and spirited expression of the figures; for the neatness of the finishing; and for the rich variety of his draperies, which usually consisted of velvets, damasks, or satins, all copied after nature, and being wonderfully imitated. He was also equally excellent in portrait, and by many was placed in competition even with Titian. He died in 1564.

BONUS HENRICUS. See **CHINOGODIUM**.

BONZES, Indian priests. The Tonquinse have a pagod or temple in each town; and each pagod has at least two bonzes belonging to it: some have 30 or 40. These bonzes, in order to distinguish themselves from the laity, wear a chaplet about their necks consisting of 100 beads; and carry a staff, at the end of which is a wooden bird. They live upon the alms of the people; yet are very charitably disposed, and maintain several orphans and widows out of their own collections.

The bonzes of China are the priests of the Fohists, or sect of Fohi. It is one of their established tenets, that there are rewards allotted for the righteous, and punishments for the wicked, in the next world; and that there are various mansions in which the souls of

men will reside, according to their different degrees of merit. But, in order to deserve the favour of heaven, the bonzes instruct the people to treat the priests with respect and reverence, to support and maintain them, and to erect temples and monasteries for them. They tell them, that, unless they comply with these injunctions, they will be cruelly tormented after death, and pass through a disagreeable variety of transigrations: in short, that they will be changed into mules, asses, rats, and mice.

The Chinese bonzes, according to F. le Compte, are no better than a gang of dissolute idle fellows. All their aim is to incite people to commiserate their abject condition: to which end they have recourse to several tricks and impostures. When the common arts of address fail them, they try what public acts of penance will do. Some of them drag heavy chains 30 feet long after them; some sit in the highway knocking their heads against flint stones; others set particular drugs on fire upon their heads: all these are several ways of drawing the attention and exciting the compassion of the people, and they seldom fail of success.

The bonzes of Japan are, for the generality, gentlemen of the highest extraction; for when a gentleman of quality finds his family grow too numerous, nay, when he has only two sons, he generally makes the youngest a bonze, to prevent all domestic broils and confusions. These priests are dressed in various colours; their apartments are very commodious, and situated in the healthiest parts of the country.

F. Navarrete tells us, that the bonzes are obliged to chastity; and that, on the 2d of April 1667, a petty king of Canton had condemned 11 of them to be burnt alive for incontinence. He adds, that it was reported of an empress of the last reigning family, who had a particular kindness for the bonzes, that she granted them a dispensation for the use of women during three days. The bonzes of China, according to the same author, are computed at 50,000.

BOOBY, in ornithology. See **PELICANUS**.

BOOK, the general name of almost every literary composition; but, in a more limited sense, is applied only to such compositions as are large enough to make a volume. As to the origin of books or writing, those of Moses are undoubtedly the most ancient that are extant: But Moses himself cites many books which it believed to be written before his time.

Of profane books, the oldest extant are Homer's poems, which were so even in the time of Sextus Empiricus; though we find mention in Greek writers of seventy others prior to Homer; as Hermes, Orpheus, Daphne, Horus, Linus, Musæus, Palamedes, Zoroaster, &c.: but of the greater part of these there is not the least fragment remaining; and of others, the pieces which go under their names are generally held, by the learned, to be supposititious.

Several sorts of materials were used formerly in making books: Plates of lead and copper, the barks of trees, bricks, stone, and wood, were the first materials employed to engrave such things upon as men were willing to have transmitted to posterity. Josephus speaks of two columns, the one of stone, the other of brick, on which the children of Seth wrote their inventions and astronomical discoveries: Porphyry makes

mention of some pillars, preserved in Crete, on which the ceremonies preserved by the Corybantes in their sacrifices were recorded. Hesiod's works were originally written upon tables of lead, and deposited in the temple of the Muses, in Bœotia: The ten commandments, delivered to Moses, were written upon stone; and Solon's laws upon wooden planks. Tables of wood, box, and ivory, were common among the ancients: When of wood, they were frequently covered with wax, that people might write upon them with more ease, or blot out what they had written. The leaves of the palm-tree were afterwards used instead of wooden planks, and the finest and thinnest part of the bark of such trees, as the lime, the ash, the maple, and the elm; from hence comes the word *liber*, which signifies the inner bark of the trees: and as these barks are rolled up, in order to be removed with greater ease, these rolls were called *volumen*, a volume; a name afterwards given to the like rolls of paper or parchment.

Thus we find books were first written on stones, witness the Decalogue given to Moses: Then on the parts of plants; as leaves, chiefly of the palm-tree; the rind and barks, especially of the tilia, or Phillyrea, and the Egyptian papyrus. By degrees wax, then leather, were introduced, especially the skins of goats and sheep, of which at length parchment was prepared: then lead came into use; also linen, silk, horn, and lastly paper itself.

The first books were in the form of blocks and tables; but as flexible matter came to be wrote on, they found it more convenient to make their books in the form of rolls: These were composed of several sheets fastened to each other, and rolled upon a stick, or *umbilicus*; the whole making a kind of column, or cylinder, which was to be managed by the umbilicus as a handle, it being reputed a crime to take hold of the roll itself: The outside of the volume was called *frons*; the ends of the umbilicus, *cornua*, which were usually carved, and adorned with silver, ivory, or even gold and precious stones: The title *σύλλαβος*, was struck on the outside; the whole volume, when extended, might make a yard and a half wide, and fifty long. The form which obtains among us is the square, composed of separate leaves; which was also known, tho' little used, by the ancients.

To the form of books belongs also the internal œconomy, as the order and arrangement of points and letters into lines and pages, with margins and other appurtenants. This has undergone many varieties. At first the letters were only divided into lines; then into separate words; which by degrees were noted with accents, and distributed, by points and stops, into periods, paragraphs, chapters, and other divisions. In some countries, as among the orientals, the lines began from the right and ran leftward; in others, as the northern and western nations, from left to right; others, as the Greeks, followed both directions, alternately going in the one, and returning in the other, called *boyfirzphedon*: In most countries, the lines run from one side to the other; in some, particularly the Chinese, from top to bottom.

Multitude of Books has been long complained of: the complaint is as old as Solomon, who lived three thousand years ago: they are grown too numerous not only to procure and read, but to see, to learn the

names of, or even to number. England has more to fear on this score than other countries; since, besides our own produce, we have for some years past drained our neighbours. However, as bishop Caramuel's scheme miscarried, which was to write about an hundred volumes in folio, and then prevail on the civil and military powers to oblige all their subjects to read them, we need not much regret the multitude of books.

As knowledge, however, is naturally advantageous, and as every man ought to be in the way of information, even a superfluity of books is not without its use, since hereby they are brought to obtrude themselves on us, and engage us when we had least design. This advantage, an ancient father observes, we owe to the multiplicity of books on the same subject, that one falls in the way of one man, and another best suits the level or the apprehension of another. "Every thing that is written (says he) does not come into the hands of all persons: perhaps some may meet with my books, who may hear nothing of others which have treated better of the same subject. It is of service, therefore, that the same questions be handled by several persons, and after different methods, though all on the same principles, that the explications of difficulties and arguments for the truth, may come to the knowledge of every one by one way or other." Add, that the multitude is the only security against the total loss or destruction of books: it is this that has preserved them against the injuries of time, the rage of tyrants, the zeal of profecutors, and the ravages of barbarians; and handed them down, through long intervals of darkness and ignorance, safe to our days. *Solique non norunt hæc monumenta mori.*

Scarcity of Books. Of the scarcity and value of books during the seventh and many subsequent centuries, the following curious account is given by Mr War-ton in his history of English Poetry, Vol. I.

"Towards the close of the seventh century (says he), even in the papal library at Rome, the number of books was so inconsiderable, that pope Saint Martin requested Sanctamand bishop of Maestricht, if possible, to supply this defect from the remotest parts of Germany. In the year 855, Lupus, abbot of Ferrieres in France, sent two of his monks to Pope Benedict III. to beg a copy of *Cicero de Oratore*, and Quintilian's Institutes, and some other books: 'for (says the abbot) although we have part of these books, yet there is no whole or complete copy of them in all France.' Albert, abbot of Gemblours, who with incredible labour and immense expence had collected an hundred volumes on theological, and fifty on profane, subjects, imagined he had formed a splendid library. About the year 790, Charlemagne granted an unlimited right of hunting to the abbot and monks of Sithiu, for making their gloves and girdles of the skins of the deer they killed, and covers for their books. We may imagine that these religious were more fond of hunting than reading. It is certain that they were obliged to hunt before they could read: and at least it is probable, that under these circumstances, and of such materials, they did not manufacture many volumes. At the beginning of the tenth century books were so scarce in Spain, that one and the same copy of the bible, Saint Jerom's epistles, and some volumes of ecclesiastical offices and martyrologies, often served several different

ook. monasteries. Among the constitutions given to the monks of England by archbishop Lanfranc, in the year 1072, the following injunction occurs. At the beginning of Lent, the librarian is ordered to deliver a book to each of the religious: a whole year was allowed for the perusal of this book; and at the returning Lent, those monks who had neglected to read the books they had respectively received, are commanded to prostrate themselves before the abbot, and to supplicate his indulgence. This regulation was partly occasioned by the low state of literature which Lanfranc found in the English monasteries. But at the same time it was a matter of necessity, and is in great measure to be referred to the scarcity of copies of useful and suitable authors. In an inventory of the goods of John de Pontiffara, bishop of Winchester, contained in his capital palace of Wulvesey, all the books which appear are nothing more than *Septendecim pecie librorum de diversis scientiis*. This was in the year 1294. The same prelate, in the year 1299, borrows of his cathedral convent of St Swilhin at Winchester, *Bibham bene glossatam*; that is, the Bible with marginal Annotations, in two large folio volumes; but gives a bond for due return of the loan, drawn up with great solemnity. This Bible had been bequeathed to the convent the same year by Pontiffara's predecessor, bishop Nicholas de Ely; and in consideration of so important a bequest, that is *pro bona Biblia dicti episcopi bene glossata*, and one hundred marks in money, the monks founded a daily mass for the soul of the donor. When a single book was bequeathed to a friend or relation, it was seldom without many restrictions and stipulations. If any person gave a book to a religious house, he believed that so valuable a donation merited eternal salvation; and he offered it on the altar with great ceremony. The most formidable anathemas were peremptorily denounced against those who should dare to alienate a book presented to the cloister or library of a religious house. The prior and convent of Rochester declare, that they will every year pronounce the irrevocable sentence of damnation on him who shall purloin or conceal a Latin translation of Aristotle's *Physics*, or even obliterate the title. Sometimes a book was given to a monastery on condition that the donor should have the use of it during his life; and sometimes to a private person, with the reservation that he who receives it should pray for the soul of his benefactor. The gift of a book to Lincoln cathedral, by bishop Repyndon, in the year 1422, occurs in this form, and under these curious circumstances. The memorial is written in Latin, with the bishop's own hand, which I will give in English, at the beginning of Peter's Breviary of the Bible. 'I Philip of Repyndon, late bishop of Lincoln, give this book, called *Peter de Aureolis*, to the new library to be built within the church of Lincoln: reserving the use and possession of it to Richard Tryfely, clerk, canon, and prebendary, of Mil-toun, in fee, and to the term of his life; and afterwards to be given up and restored to the said library, or the keepers of the same, for the time being, faithfully, and without delay. Written with my own hand, A. D. 1422.' When a book was bought, the affair was of so much importance, that it was customary to assemble persons of consequence and character, and to make a formal record that they were present on this occasion.

ook. Among the royal manuscripts, in the book of the Sentences of Peter Lombard, an archdeacon of Lincoln has left this entry. 'This book of the Sentences belongs to master Robert archdeacon of Lincoln, which he bought of Geoffrey the chaplain, brother of Henry vicar of Northelkington, in the presence of master Robert de Lee, master John of Lirding, Richard of Loda clerk, Richard the almoner, the said Henry the vicar, and his clerk, and others: and the said archdeacon gave the said book to God and saint Oswald, and to Peter abbot of Barton, and the convent of Barden.' The disputed property of a book often occasioned the most violent altercations. Many claims appear to have been made to a manuscript of Matthew Paris, belonging to the last-mentioned library; in which John Russell, bishop of Lincoln, thus conditionally defends or explains his right of possession. 'If this book can be proved to be or to have been the property of the exempt monastery of saint Alban in the diocese of Lincoln, I declare this to be my mind, that in that case I use it at present as a loan under favour of those monks who belong to the said monastery. Otherwise, according to the condition under which this book came into my possession, I will that it shall belong to the college of the blessed Winchester Mary at Oxford, of the foundation of William Wykham. Written with my own hand at Buckdane, 1st Jan. A. D. 1488. Jo. Lincoln. Whoever shall obliterate or destroy this writing, let him be anathema.' About the year 1225, Roger de Insula, dean of York, gave several Latin bibles to the university of Oxford, with a condition that the students who perused them should deposit a cautionary pledge. The library of that university, before the year 1300, consisted only of a few tracts, chained or kept in chests in the choir of St Mary's church. In the year 1327, the scholars and citizens of Oxford assaulted and entirely pillaged the opulent Benedictine abbey of the neighbouring town of Abingdon. Among the books they found there, were one hundred psalters, as many grayles, and 40 missals, which undoubtedly belonged to the choir of the church: but besides these, there were only twenty-two codices, which I interpret books on common subjects. And although the invention of paper, at the close of the eleventh century, contributed to multiply manuscripts, and consequently to facilitate knowledge, yet, even so late as the reign of our Henry VI. I have discovered the following remarkable instance of the inconveniences and impediments to study, which must have been produced by a scarcity of books. It is in the statutes of St Mary's college at Oxford, founded as a seminary to Osney abbey in the year 1446: 'Let no scholar occupy a book in the library above one hour, or two hours at most; so that others shall be hindered from the use of the same.' The famous library established in the university of Oxford by that munificent patron of literature Humphrey Duke of Gloucester contained only 600 volumes. About the commencement of the 14th century there were only four classics in the royal library at Paris. There were one copy of Cicero, Ovid, Lucan, and Boethius. The rest were chiefly books of devotion, which included but few of the fathers: many treatises of astrology, geomancy, chiromancy, and medicine, originally written in Arabic, and translated into Latin or French: pandects, chronicles, and romances. This

Book.

collection was principally made by Charles V. who began his reign in 1365. This monarch was passionately fond of reading; and it was the fashion to send him presents of books from every part of the kingdom of France. These he ordered to be elegantly transcribed and richly illuminated; and he placed them in a tower of the Louvre, from thence called *La Tour de la Libraire*. The whole consisted of 900 volumes. They were deposited in three chambers; which on this occasion were wainscoted with Irish oak, and ciled with cypress curiously carved. The windows were of painted glass, fenced with iron bars and copper wire. The English became masters of Paris in the year 1425; on which event the Duke of Bedford, regent of France, sent the whole library, then consisting of only 853 volumes, and valued at 223 livres, into England; where perhaps they became the ground-work of Duke Humphrey's library just mentioned. Even so late as the year 1471, when Louis XI. of France borrowed the works of the Arabian physician Rhasis from the faculty of medicine at Paris, he not only deposited by way of pledge a quantity of valuable plate, but was obliged to procure a nobleman to join with him as surety in a deed, by which he bound himself to return it under a considerable forfeiture. The excessive prices of books in the middle ages afford numerous and curious proofs. I will mention a few only. In the year 1174, Walter, prior of St Swithin's at Winchester, afterwards elected abbot of Westminster, a writer in Latin of the lives of the bishops who were his patrons, purchased of the monks of Dorchester in Oxfordshire, Bede's Homilies and St Austin's Pfalter, for twelve measures of barley, and a pall on which was embroidered in silver the history of St Birinus converting a Saxon king. Among the royal manuscripts in the British museum there is Comestor's Scholastic History in French; which, as it is recorded in a blank page at the beginning, was taken from the king of France at the battle of Poitiers; and being purchased by William Montague Earl of Salisbury for 100 mares, was ordered to be sold by the last will of his countess Elizabeth for 40 livres. About the year 1400, a copy of John of Meun's *Roman de la Rose* was sold before the palace-gate at Paris for 40 crowns, or L. 33 : 6 : 6."

Books, burning of; was a kind of punishment much in use among the Romans, by legal sentence: sometimes the care of the execution was committed to *triumviri* appointed on purpose; sometimes to the pretors, and sometimes to the ædiles. Labienus, whom from his satirical spirit some have called *Rabienus*, is said to have been the first who underwent the severity of it. His enemies procured a *senatusconsultum*, whereby all his books published during seven years were ordered to be collected and burnt. "The thing (says Seneca) then appeared new and strange, to take revenge on learning!" *Res nova & injusta! supplicium de studiis sumi.* Cassius Savius, a friend of Labienus, hearing the sentence pronounced, cried aloud, "That they must burn him too, since he had got all the books by heart?" *Nunc me vicium uris oportet, quia illos didici.* Labienus could not survive his books, but shutting himself up in the tomb of his ancestors, pined away, and was buried alive. Divers other ancient testimonies concerning the burning of books are given in Reimm. Idea Syst. Antiq. Liter. p. 389.

Book is also used for a part or division of a volume or large work. In this sense we say, the *book of Genesis*, the *first book of Kings*, the *five books of Moses*, &c. The Digest is contained in fifty books, the Code in twelve books.

Books are usually subdivided into chapters, sometimes into sections or paragraphs: accurate writers quote chapter and book.

Everlasting Book.—We find in Signior Castaquo's account of the asbestus, a scheme for the making of a book, which, from its imperishable nature, he is for calling the *book of eternity*. The leaves of this book were to be of the asbestus paper, the covers of a thicker sort of work of the same matter, and the whole sewed with thread spun from the same substance. The things to be commemorated in this book were to be written in letters of gold; so that the whole matter of the book being incombitible, and everlastingly permanent against the force of all the elements, and subject to no changes from fire, water, or air, must remain for ever, and always preserve the writing committed to it. He carried this project so far towards execution, as to find a way of making a sort of paper from the asbestus, which was so tractable and soft, that it very well resembled a thin parchment; this, by the same process, was capable of being thickened or thinned at pleasure, and in either state equally resisted the fire. The covering of the thinnest kind of this paper with fire, only makes it red hot and very clear, the fire seeming to pass through it without wadding or altering any part of it. Copper, iron, or any other metal except gold or silver, exposed to the same degree of fire in the same thin plates, would be found not to bear it in this manner, but to scale, and burn it into scoriae at the surface, which this stone does not.

Book-Binding. The art of gathering together and sewing the sheets of a book, and covering it with a back, &c. It is performed thus: The leaves are first folded with a folding-stick, and laid over each other in the order of the signature; then beaten on a stone with an hammer, to make them smooth and open well; and afterwards pressed. They are sewed upon bands, which are pieces of cord or packthread; six bands to a folio book; five to a quarto, octavo, &c.; which is done by drawing a thread through the middle of each facet, and giving it a turn round each band, beginning with the first and proceeding to the last. After this the books are glued, and the bands opened and scraped, for the better fixing the pasteboards; the back is tuned with a hammer, and the book fixed in a press between two boards, in order to make a groove for fixing the pasteboards; these being applied, holes are made for fixing them to the book, which is pressed a third time. Then the book is at last put to the cutting press, betwixt two boards; the one lying even with the press, for the knife to run upon; the other above it, for the knife to run against: after which the pasteboards are squared.

The next operation is the sprinkling the leaves of the book; which is done by dipping a brush into vermilion and sap-green, holding the brush in one hand, and spreading the hair with the other; by which motion the edges of the leaves are sprinkled in a regular manner, without any spots being bigger than the other.

Then

Book-keeping. Then remains the covers, which are either of calf-skin or of sheep-skin: these being moistened in water, are cut out to the size of the book; then smeared over with paste made of wheat-flour; and afterwards stretched over the pasteboard on the outside, and doubled over the edges withinside; after having first taken off the four angles, and indented and platted the cover at the head-band: which done, the book is covered, and

bound firmly between two bands, and then set to dry. Afterwards it is washed over with a little paste and water, and then sprinkled with a fine brush, unless it should be marbled; when the spots are to be made larger by mixing the ink with vitriol. After this the book is glazed twice with the white of an egg beaten, and at last polished with a polishing iron passed hot over the glazed cover.

Book; Book-keep- ing.

B O O K - K E E P I N G,

IS the art of recording mercantile transactions in a regular and systematic manner.

1. A merchant's books should contain every particular which relates to the affairs of the owner. They should exhibit the state of all the branches of his business, the connection of the different parts, the amount and success of the whole. They should be so full and so well arranged, as to afford a ready information in every point for which they may be consulted.

The matter which the books should contain is comprehended under the three following heads: First, The debts which are owing to the owner, and the debts which he owes to others. Secondly, The goods and other articles of property which belonged to him; the quantity and value sold, or otherwise disposed of; and the quantity and value which still remain in his possession. Thirdly, The amount of his stock when the books were opened; the profits he has obtained, and the losses he has suffered, since; and the amount of his stock at present.

That method of book-keeping which answers these purposes most clearly and concisely, is the best. The Italian method, by *double entry*, is generally preferred; at least, it is founded upon the most universal principles, and is the most convenient in extensive and complicated business: and the accountant who understands it, will find little difficulty in following, or even in inventing other methods that are better accommodated to any particular purpose.

The Italian method requires three principal books; the Waste-Book, Journal, and Leger.

SECT. I. *Of the WASTE-BOOK.*

2. The waste-book, or day-book, contains an exact register of all occurrences in business in the same order as they take place. It begins with an inventory of every thing belonging to the owner, a list of the debts due to him, and of the debts he owes to others: It is carried on with a full relation of all the money he receives or pays; of all the goods he buys or sells; and of every other occurrence in his business. Each article should be entered as soon as the transaction takes place, and should be clearly expressed in the plainest language. It should require no supply from the accountant's memory, but should be fully intelligible to any person, however unacquainted with the business: at the same time, it should be written with all convenient brevity; and, therefore, sometimes refers to invoices and other accounts, for particulars. The accountant's first care should be to have nothing defect-

ive or ambiguous; his second, to have nothing superfluous.

3. The date is written in text on the top of each page. The articles are separated from each other by a line; and the transactions of one day are separated from those of another by a double line, in the middle of which there is left a blank space for inserting the day of the month. This book must be kept with the greater care, as it contains the materials from which the other books are composed; and any error or defect will occasion a like one in the others. Besides, it is the book whose authority is trusted to, and which must be exhibited to judges, or arbiters, when an account is disputed. As the journal is filled up from the waste-book, the authority of the former is esteemed more authentic, unless there be an obvious mistake through hurry; and either of these books is depended on rather than the leger, which, from its form, is more liable to error, and may be more easily vitiated by a fraudulent design.

4. As the waste-book contains the whole substance of the business, it may be applied so as to afford any information that can be wanted: but the labour of consulting it would be very great. For instance, if it were required to know how much any person owes us, we must look over the book from the beginning, and mark down every article in which we have dealt with him: or, if it were required to know what quantity of goods we should have on hand, we must look over the whole book, and mark down every article bought or sold. This operation would not only be found very tedious, but much exposed to the risk of omissions. To prevent these inconveniences, another book is used, in which the articles are arranged in a methodical order. This book is called the *Leger*, and we shall consider it next; because the journal, though it comes before it in the order of writing, cannot be well understood, till the nature of the leger be explained.

SECT. II. *Of the LEGER.*

5. In the leger, articles of the same kind are collected together; and, for that purpose, it is divided into many accounts, under which the different branches of business are arranged. Each account is introduced by a proper title, to explain the nature of the articles it contains; and articles of opposite kinds, which belong to the same account, are placed on the opposite pages of the same folio: for instance, money received on the one side, and money paid on the other; or goods bought on the one side, and goods sold on the other. The left-

hand

hand page is called the *Debtor* or *Dr.* side of the account, and the right-hand page the *Creditor* or *Cr.* side. The difference between the sums of the *Dr.* and *Cr.* sides is called the *Balance*.

Accounts in the ledger are of three kinds, which answer to the three purposes of book-keeping mentioned § 1.

6. First, Personal Accounts. It is necessary to open an account for every person or company with whom there are any dealings on credit. At opening the books, if they be indebted to the owner, the debt is entered on the *Dr.*; but, if he be indebted to them, it is entered on the *Cr.* During the course of the business, goods sold on trust, money paid, and every thing for which they are accountable to him, is entered on the *Dr.*; but goods bought on trust, money received, and every thing for which he is accountable to them, is entered on the *Cr.* The balance shows how much they owe him, when the *Dr.* side is greatest; and how much he owes them, when the *Cr.* side is greater.

7. Secondly, Real accounts. By this we understand accounts of property of whatever kind, such as ready money, goods, houses, lands, ships, shares in public companies, and the like.

The account of ready money is intitled *Cash*. On the *Dr.* side, the money on hand at opening the books is entered, and afterwards every article of money received. On the *Cr.* side, there is entered every article of money paid out; and the balance shows how much ought to be on hand. The sum of the *Dr.* side of this account is always greater than that of the *Cr.* side.

8. Accounts of goods are generally ruled with inner columns for entering the quantities. When the books are opened, the goods on hand are entered on the *Dr.* side of the respective accounts; the quantities being placed in the inner, and the values in the outer column. Goods bought are entered in the same manner, and goods sold are entered on the *Cr.* side; the quantities and values being placed in the proper columns. Charges laid out on goods are entered on the *Dr.* side; and, when an incidental advantage arises from them, such as public bounty, it is entered on the *Cr.*

If the sums of the inner columns on the opposite sides be equal, it shows that the goods are all sold, and then the balance of the money column shows the gain or loss. If the *Cr.* side be greater, it is gain; if the *Dr.* side be greater, it is loss. If the sum of the inner column be greater on the *Dr.* side, it shows that part of the goods are on hand; and their value must be added to the sum of the *Cr.* side, in order to determine the gain or loss.

9. If there be two or more kinds of the same sort of goods, they may be entered in the same account, allowing as many inner columns as there are kinds, and entering the quantities of each kind in the inner column referred for it. This method exhibits the gain or loss on the whole goods; but does not show how much of it arises from each kind.

Or, a separate account may be opened for each kind, distinguishing the titles by the qualities, or by some other mark. Thus, one account may be kept for fine linen, another for coarse linen; one for port-wine crop 1787, another for port-wine crop 1788; one for rum from Jamaica, another for rum from Barbadoes. This method shows the gain or loss on each kind.

N^o. 50.

When there are more kinds than can be conveniently introduced in the same account, they may be divided into several classes, each class being placed in a separate account; and the particular kinds distinguished in inner columns. Thus the account of fine linen may be divided into several columns, for different kinds, distinguished by the number of threads in the breadth, or by any other convenient character.

10. Accounts of ships contain on the *Dr.* the value of the ship when the books are opened, and all expences laid out thereon; on the *Cr.* all freights received. In like manner, accounts of houses or lands have the value of the subject, and all repairs, or other charges, entered on the *Dr.* and all rents or other profits received on the *Cr.* If the subject be sold in whole or in part, the sale is entered on the *Cr.* And the balance, after valuing the subject (if any) on hand, shows the gain or loss.

Accounts of property in the public funds, or shares in companies, public or private, contain the value, or money paid in, on the *Dr.* and the dividends received on the *Cr.* and are balanced as other real accounts.

Some persons open accounts for household furniture, plate, jewels, books, or the like. The entries on these accounts are made in the same manner.

In general, real accounts contain the value of the property, and all charges, on the *Dr.* and the sales and other returns on the *Cr.* When the account is to be balanced, if any property remains, the value thereof is placed on the *Cr.*; and then the balance shows the loss or gain, according as the *Dr.* or *Cr.* side is greatest.

11. Thirdly, Accounts of STOCK, PROFIT and LOSS, and its subsidiary accounts, which are sometimes called *fictitious accounts*.

The *stock* account contains on the *Dr.* the amount of the debts which the owner owes when the books are opened; and on the *Cr.* the amount of ready money, goods, debts, and property of every kind belonging to him: therefore the balance shows what his net stock is; or, in case of bankruptcy, how much his debts exceed his effects. There is nothing further entered on this account till the books are balanced: and then, if the business has yielded profit, the net gain is entered on the *Cr.*; if it has been unsuccessful, the net loss is entered on the *Dr.*: after which, the balance shows the net stock at the time the books are closed.

12. The *Profit and Loss* account contains every article of gain on the *Cr.* and every article of loss on the *Dr.* The balance shows the net gain or loss, and is transferred to the proper side of the stock-account, as mentioned above. This account is partly composed of articles that occur while the books are running. For example, legacies received are entered on the *Cr.* goods destroyed on the *Dr.* The rest of the articles are those of gain and loss, arising from the real accounts, which are collected when the books are balanced.

13. It has been found convenient to open several subsidiary accounts, in order to shorten and methodise that of profit and loss. These contain certain articles of gain or loss, which may be reduced under distinct heads. They are in effect so many parts of the profit and loss account, and their balances are entered on the proper side of that account when the books are closed. The chief of these accounts are the following.

6

The

Interest account, Which contains on the Dr. sums paid or incurred for interest; and on the Cr. sums received, or become due for the same.

Commission account, Which contains on the Cr. articles of gain received or owing us for our trouble in transacting business for others. There are seldom any entries on the Dr.

Charges merchandize, Which contains on the Dr. all charges paid or incurred on the business, which do not belong to any particular account, as shop-rent, public burdens for trade, clerks wages, pollages, and the like. If any of these should afterwards be charged to some other account, the sum so charged is entered on the Cr.

Proper expenses, Which contains on the Dr. money or any thing else, withdrawn from the trade for our private use. There are seldom any entries on the Cr. The amount of this account, as well as the former, is not properly loss; but as it has the same effect in diminishing the stock, it is placed in the same manner to the Dr. of profit and loss.

Loss by bad debts, Which contains on the Dr. such debts as we reckon desperate; and on the Cr. any of these which may happen to be unexpectedly recovered.

Account of abatements, Which contains on the Dr. discounts allowed by us on payments received; on the Cr. discounts (if any) allowed to us on payments made. It is particularly useful in retail business, where discounts are often given, to show how much they amount to.

Insurance account, Which contains on the Cr. premiums received for making insurances; and, on the Dr. losses sustained on the same. There may be several accounts of this kind, such as insurance against sea-hazard, which is the most common; insurance against fire; insurance of lives; and insurance of debts. The balance shows the gain or loss which arises from being concerned in insurance.

More or fewer of these accounts may be used, according as the articles are frequent; and others may be invented to suit the purposes of the business which the books are kept for.

14. Every simple transaction in business belongs to two accounts, and must be entered on the Dr. of the one and on the Cr. of the other. Thus, when a person becomes indebted to us, the article he owes must be entered on the Dr. of his account; and, if it be for money paid him, it is also entered on the Cr. of cash; if for goods sold, it is entered on the Cr. of the account of goods; if for any thing delivered him by another person at our desire, it is entered on the Cr. of the deliverer's account; if for any wager or bargain, by which we are gainers, it is entered on the Cr. of profit and loss. Thus, in whatever way the debt arises, it is entered on the Cr. of some other account, as well as on the Dr. of the person's account who owes it.

In like manner, when we become indebted to any person, the article we owe must be entered on the Cr. of his account. If it be for money received, it is also entered on the Dr. of cash; if for goods bought, it is entered on the Dr. of the account of goods; if for any thing delivered to another person at our desire, it is entered on the Dr. of the receiver's account; and if it

be in consequence of a losing bargain, it is entered on the Dr. of profit and loss.

Again, when goods are received, the transaction is entered on the Dr. of the account of goods. If they be bought for ready money, it is also entered on the Cr. of cash; if on trust, it is entered on the Cr. of the feller; if they be exchanged for other goods, it is entered on the Cr. of the goods delivered; if they be obtained by some profitable business, without any return, it is entered on the Cr. of profit and loss.

When goods are delivered, the transaction is entered on the Cr. of the account of goods; and, if they be sold for ready money, it is also entered on the Dr. of cash; if on credit, it is entered on the Dr. of the purchaser; if exchanged for other goods, it is entered on the Dr. of the goods received; and, if they be given gratis, or destroyed, it is entered on the Dr. of profit and loss.

Lastly, When any article of loss occurs, the transaction is entered on the Dr. of profit and loss; and as we must either pay it in money or goods, or remain indebted to some person for it, it must be entered on the Cr. of cash, or of goods delivered, or of the person intitled to receive it. And, when an article of gain occurs, it is entered on the Cr. of profit and loss, and also on the Dr. of cash or goods, if money or goods be received; and on the Dr. of the person accountable for it, if not immediately paid.

Thus, every article in any account, whether personal or real, or belonging to profit and loss, corresponds to some other article on the opposite of a different account. The same sum is entered on the Dr. of one account and on the Cr. of the other; and it follows from this, that, *If all the accounts in the ledger be added, the amount of the sums of the Dr. will be equal to those of the Cr.*

SECT. III. Of the JOURNAL.

15. THE journal is a fair record of all the transactions compiled from the waste-book, in the same order as they stand there; but expressed in a technical style, that it may be transferred to the ledger with more ease.

When we are to enter any article in the journal, we must consider which accounts in the ledger it will require to be placed to, both on the Dr. and Cr. and write [*the former account*] Dr. to [*the latter account*]; then we annex an explanation of the article, and place the sum in the money-column.

EXAMPLE.

Waste-book.) Sold for ready money, 30 yards linen, at 3s
L. 4 10 —
Journal.) Cash Dr. to Linen. Sold 30 yards, at 3s
L. 4 10 —

Here we consider, that the article must be entered on the Dr. of cash, because money is received; and on the Cr. of linen, because linen is delivered: Therefore we write *Cash Dr. to Linen*, to which we annex the nature of the transaction. The article thus entered is called a *journal-post*; *Cash* is called the *Dr.*; *Linen* the *Cr.*; the words "Cash Dr. to Linen," the *Entry*, and the following words the *Narration*.

The purpose of expressing the article in this form,

is to point out the accounts in the ledger, to which it will require to be posted, and thereby enable the accountant to write the ledger with more ease than he could do if it were filled up immediately from the waste-book.

The learner will be able, from this example, to enter any simple article in the journal, providing he knows the accounts to which it should be posted on the Dr. and Cr. of the ledger. This must be collected from the description of the ledger accounts already given § 6—13. and the nature and tendency of the article.

16. GENERAL RULES for the JOURNAL-ENTRIES.

I. Every thing received, or person accountable to us, is Dr.

II. Every thing delivered, or person to whom we are accountable, is Cr.

17. As the whole art of writing the journal depends on a proper choice of the Drs. and Crs. we shall give some particular rules for the most common cases, and a few examples for the illustration and practice of each.

Rule I. *The person to whom any thing is delivered is Dr. to the thing delivered, when nothing is received in return.*

Therefore when money is paid, the receiver is Dr. to cash.

When goods or other property is sold on credit, the purchaser is Dr. to the thing sold. Thus,

Waste-book.) Paid John Bell in full	L. 52 — —
Journal.) <i>John Bell Dr. to Cash</i> , paid him in full	52 — —
Waste-book.) Sold 50 yards cloth to J. Hill, at 12s	30 — —
Journal.) <i>J. Hill Dr. to Cloth</i> , fold him 50 yards, at 12s	30 — —

18. Rule II. *A thing received is Dr. to the person from whom it is received, when nothing is delivered in return.*

Therefore, when money is received, Cash is Dr. to the payer: when goods are bought, the goods are Dr. to the seller. Thus,

Waste-book.) Received from Thomas Gay in full	L. 72 — —
Journal.) <i>Cash Dr. to Thomas Gay</i> , received in full	72 — —
Waste-book.) Bought from J. Hawley 60 lb. wool, at 9d	2 5 —
Journal.) <i>Wool Dr. to J. Hawley</i> , bought 60 lb. at 9d	2 5 —

19. Rule III. *A thing received is Dr. to the thing given for it.*

Therefore goods bought for ready money are Dr. to cash.

When goods are sold for ready money, Cash is Dr. to the goods.

When goods are bartered, the goods received are Dr. to the goods delivered. Thus,

Waste-book.) Bought for ready money 10 hds. wine, at L. 15	L. 150 — —
Journal.) <i>Wine Dr. to Cash</i> , bought 10 hds. at L. 15	150 — —

Waste-book.) Sold for ready money 100 gallons rum, at 9s	45 — —
Journal.) <i>Cash Dr. to Rum</i> , sold 100 gallons, at 9s	45 — —
Waste-book.) Bartered 3 hds. wine, at L. 15, for 100 gallons rum, at 9s	45 — —
Journal.) <i>Rum Dr. to Wine</i> , received 100 gallons at 9s in barter for 3 hds. at L. 15	45 — —

20. Rule IV. *Goods and other real accounts are Dr. for all charges laid out on them. If money be laid out, they are Dr. to Cash; if any thing else be delivered, they are Dr. to the thing delivered; if the charge be taken in trust, they are Dr. to the person to whom it is due.* Thus,

Waste-book.) Paid for repairs to ship Traffick	L. 18 — —
Journal.) <i>Ship Traffick Dr. to Cash</i> , paid for repairs	18 — —
Waste-book.) Delivered wood from my timber-yard for repairing the Angel-tavern	15 — —
Journal.) <i>Angel tavern Dr. to Wood</i> , delivered for repairing the same	15 — —
Waste-book.) Due to William Carpenter for repairs to the Angel-tavern	12 — —
Journal.) <i>Angel-tavern Dr. to William Carpenter</i> , due him for repairs	12 — —

21. Rule V. *When rents of houses or lands, freights of ships, bounties on goods, or any other profits from real accounts are received, Cash is Dr. to the account from which the profit arises: if any thing besides money be received, the article received is Dr.: if they remain unpaid, the person who owes them is Dr.* Thus,

Waste-book.) Received freight of the ship Traffick for a voyage to London	L. 35 — —
Journal.) <i>Ship Traffick Dr. to Cash</i> , received freight to London	35 — —
Waste-book.) Received 100 barrels salmon, being the rent of Inver fishery, at 52s	260 — —
Journal.) <i>Salmon Dr. to Inver fishery</i> , received the rent, being 100 barrels, at 52s	260 — —
Waste-book.) John Public owes me a year's rent of the Angel-tavern	52 — —
Journal.) <i>John Public Dr. to Angel-tavern</i> , for a year's rent due by him	52 — —

22. Rule VI. *When an article of loss occurs, Profit and Loss, or some subsidiary account, is Dr. If the loss be paid in ready money, it is Dr. to Cash; if it be paid in any thing else, it is Dr. to the thing delivered. If it remain unpaid, it is Dr. to the person to whom it is owing.* Thus,

Waste-book.) Given my daughter at her marriage	L. 500 — —
Journal.) <i>Profit and Loss Dr. to Cash</i> , given my daughter at her marriage	500 — —
Waste-book.) Taken for family use from my granary 3 bolls meal, at 13s 4d	2 — —
Journal.)	

Journal.) *Profit and Loss* [or *Proper expenses*] *Dr. to Alack*, taken for family use, 3 bolls, at 13s 4d 2 — —
 Waste-book.) Due James Rich for a year's interest on L. 1000, at 4 percent. 40 — —
 Journal.) *Profit and Loss* [or *Interest account*] *Dr. to James Rich*, due him a year's interest on L. 1000 at 4 percent. 40 — —

23. Rule VII. *When an article of gain occurs, that is not immediately connected with any real account, Cash, the article received, or the person accountable for it, is Dr. to Profit and Loss, or to some subsidiary account.*

Thus,
 Waste-book.) Received in a gift from my father L 100 — —
 Journal.) *Cash Dr. to Profit and Loss*, received from my father 100 — —
 Waste-book.) Received in like manner at opening shop, 100 yards cloth at 12s 60 — —
 Journal.) *Cloth Dr. to Profit and Loss*, received from my father at opening shop 100 yards, at 12s 60 — —
 Waste-book.) James Barbour owes me a year's interest of L. 1000 50 — —
 Journal.) *James Barbour Dr. to Profit and Loss* [or *Interest account*] due by him for a year's interest of L. 1000 50 — —

24. Rule VIII. *When one person pays money, or delivers any thing else to another on our account, the person who receives it is Dr. to the person who pays it.* Thus,

Waste-book.) James Goldsmith has paid the bank of Scotland on my account L 100 — —
 Journal.) *Bank of Scotland Dr. to James Goldsmith*, paid them by him 100 — —
 Waste-book.) Arthur Young has delivered James Baker 100 quarters wheat, for which I am to account to him, at 30s 150 — —
 Journal.) *James Baker Dr. to Arthur Young*, for 100 quarters wheat delivered him on my account, at 30s 150 — —
 Payments of this kind are often transacted by bills of exchange.

25. These examples will make the learner acquainted with the form of the journal, and the rules extend to the greatest part of the simple transactions that occur in domestic trade. We may observe, that the technical sense of the words *Dr.* and *Cr.* has an analogy to their meaning in common language, but is not precisely the same. Thus, in *Ex. 1.* Rule VIII. the journal-entry is, *Bank of Scotland Dr. to James Goldsmith*; by which we are not to understand that the bank is indebted to James Goldsmith; for a debt between them has no connection with our business; and therefore ought not to be entered in our books: the meaning of the entry is, that the bank becomes indebted to us by the transactions narrated; and that we become indebted to James Goldsmith by the same.

26. An article which contains more *Drs.* or more *Cr.*s than one, is called a *complex post*. The form of these will appear from the following examples.

Ex. 1.] Sold William Drapier,
 25 pieces cloth, at L. 15
 per piece L. 375 — —
 130 stones wool, at 5s 6d
 per stone - - - 35 15 — —
 ----- L. 410 15 — —

If the two articles sold to William Drapier were entered separately in the waste-book, and transferred to the journal by Rule I. they would stand thus:

William Drapier Dr. to Cloth, sold him 25 pieces, at L. 15 - - - L. 375 — —
William Drapier Dr. to Wool, sold him 150 stones, at 5s 6d - - - 35 15 — —

And if these were posted to the ledger, there would be two articles placed to the *Dr.* of William Drapier, one to the *Cr.* of Cloth, and one to the *Cr.* of Wool.

But the sales may be entered in the form of one complex journal post, as follows:

William Drapier Dr. to Sundries,
To Cloth, for 25 pieces,
 at L. 15 - - - L. 375 — —
To Wool, for 130 stones,
 at 5s and 6d - - - 35 15 — —
 ----- L. 410 15 — —

And then there is only one article on the *Dr.* of William Drapier in the ledger.

Ex. 2.] Sold 10 pieces cloth to W. Drapier,
 at L. 15 L. 150 — —
 12 ditto to J. Mercer, at do 180 — —
 ----- L. 330 — —
 22

This example also falls under Rule I. But whereas there was one *Dr.* and two *Cr.*s in the former example, there are two *Drs.* and one *Cr.* in this: William Drapier and John Mercer, the purchasers, are *Drs.* for their respective quantities; and cloth, which is the only thing delivered, is *Cr.* for the whole quantity. The journal post is,

Sundries Dr. to Cloth,
W. Drapier, for 10 pieces, at 15l. L. 150 — —
J. Mercer, for 12 ditto at 15l. 180 — —
 ----- L. 330 — —
 22

Ex. 3.] Bought from H. Hood,
 5 puncheons rum, at L. 42, L. 210 — —
 3 hds. claret, at 33, 99 — —
 2 pipes madeira, at 56, 112 — —
 ----- L. 421 — —

This example falls under Rule II. The articles received, rum, claret, and madeira, are *Ds.*; and the person from whom they are received is the only *Cr.*

Sundries Dr. to Henry Hood,
Rum, for 5 puncheons, at 42l. L. 210 — —
Claret, for 3 hds, at 33, 99 — —
Madena, for 2 pipes, at 56, 112 — —
 ----- L. 421 — —

Ex. 4.] Bt. 50 qrs. wheat from J.
 Tull, at 35s L. 87 10 — —
 12 from S. Ellis, 36s 21 12 — —
 ----- L. 109 2 — —
 62

B O O K - K E E P I N G .

This example also falls under Rule II. There is only one Dr. wheat being the only thing received; and two Crs. because it is received from different persons.

Wheat Dr. to Sundries.

To <i>J. Tall</i> , for 50 qrs. at 35s	L 87 10 —
To <i>E. Ellis</i> , for 12 qrs. at 36s	21 12 —
	—————
	L 109 2 —

62

In like manner, examples might be given of complex posts under every rule, which contained either several Drs. or several Crs.; but as it is unnecessary to enlarge so far, we shall only add a few examples of cases, in which the different parts of the complex article fall under different rules.

Ex. 5.] Sold 150 qrs. beans to A. Arnot,

at 13s 4d	L 100 — —
75 ditto to S. Berry,	
at 13s 4d	50 — —
18 ditto for ready	
money, 13s 2d	11 17 —
	—————
243	L 161 17 —

Here beans are delivered, some to different purchasers on trust, and some for ready money. The purchasers are Drs. for the quantities sold to each, by Rule I.; Cash is Cr. for the quantity sold for ready money, by Rule III.; and beans are Cr. for the whole.

Sundries Dr. to beans.

<i>A. Arnot</i> for 150 qrs. at 13s 4d	L 100 — —
<i>S. Berry</i> , for 75	13s 4d 50 — —
<i>Cash</i> , for 18	13s 2d 11 17 —
	—————
	L 161 17 —

Ex. 6.] Bought from David Young

8 cwt. 3 qrs. copper, at L. 12 per cwt.	L 105 — —
Paid in part,	L 50 — —
Balance,	55 — —
	—————
	L 105 — —

Here the article received, copper, is the only Dr.; but as it is bought partly for ready money, and partly on credit, it is Dr. to Cash for the value of the former, by Rule III. and to the seller for the value of the latter, by Rule II.

Copper Dr. to Sundries,

For 8 cwt. 3 qrs. at L. 12 per cwt	L 105 — —
	—————
To <i>Cash</i> in part,	L 50 — —
To <i>D. Young</i> , for balance due him,	55 — —
	—————
	L 105 — —

Ex. 7.] James Wilson being bankrupt, I have accepted a composition on the debt due by him to me of L. 150, and discharged the same.

The composition received, at 15s per L. is,	L 112 10 —
And the balance lost	37 10 —
	—————
	L 150 — —

Here the whole debt of L. 150, due by James Wilson, is cancelled; and he must therefore be stated as Cr. for that sum. Cash is Dr. for the sum received, by

Rule II.; and Profit and Loss, or Loss by bad debts, for the rest, by Rule VI.

Sundries Dr. to James Wilson,

<i>Cash</i> , for compt, on L. 150,	
at 15s. per L.	L 112 10 —
<i>Profit and Loss</i> , for balance lost	37 10 —
	—————
	L 150 — —

Ex. 8.] Shipped for William Smith, per the Bonadventure, Forbes, from Leith to London,

1000 yds linen, at 1s 2d	L 58 6 8
600 lb. leather, bought from J. Currier, at 1s	30 — —
Paid charges at shipping	— 13 4
	—————
	L 89 — —

Here William Smith is Dr. for the amount of the cargo; he is debtor to Linen for the quantity delivered, as by Rule I. and to J. Currier for the leather delivered by him, by Rule VIII. and to cash for the charges paid by us, by Rule I.

William Smith Dr. to Sundries,

To <i>Linen</i> , for 1000 yards, at 1s 2d	L 58 6 8
To <i>J. Currier</i> , for 600 lb. leather, at 1s	30 — —
To <i>Cash</i> , for charges at shipping	— 13 4
Shipped per the Bonadventure, Forbes, from Leith to London.	—————
	L 89 — —

27. The learner may be assisted in understanding these and other complex posts, by resolving them into simple ones. Most of them might have been stated in that manner; and the complex form is only preferred for abridging the ledger. In some articles the different clauses are so connected, that they cannot be separated with propriety.

The narration is sometimes equally diffused through the post, after the Dr. and Cr. as in the five first examples. Sometimes the chief circumstances are narrated before the Drs. or Crs. be specified, as in Ex. 6.; sometimes after the first, as in Ex. 7.; and sometimes at the end, as in Ex. 8.

28. In some articles, there are both more Drs. and more Crs. than one. These may be entered in one journal-post, *Sundries Dr. to Sundries*, specifying first the Drs. and then the Crs. But, as this method is somewhat confused, we would recommend it as a better way to divide the transaction into two journal-posts; so that the first may contain only one Dr. and the second only one Cr.

29. It is neither practicable nor necessary to enumerate all kinds of complex posts that may occur in business. We shall here only mention the entries which occur at opening the books.

The first journal-post contains the substance of the inventory. The entry is *Sundries Drs. to Stock*; the particular Drs. are *Cash*, the different kinds of goods and other property belonging to us, and the persons indebted to us.

The second journal-post contains the debts due by us. The entry is, *Stock Dr. to Sundries*; the particular Crs. are the persons to whom we are indebted.

The form of these entries is more fully exhibited at the beginning of the following sets.

30. The journal should be written by one person, in a fair hand and at leisure hours. The articles are separated, and the titles and dates marked in the same manner as in the waste-book, § 3. The entries are written in half text, for ornament and distinction. In the inventory, the designation (or the business, station, and place of residence) of every person is mentioned; and the same is done the first time that any name occurs in journal-entry. At other times, it is sufficient to enter the name without the designation, unless we have dealings with two persons of the same name; in which case, it is always necessary to annex the designation, in order to distinguish them. The narration should be complete, without referring to the waste-book; and so clear, that every person, acquainted with the style of the journal, may understand it with ease. When the post is written, we mark a dash / against the article, on the margin of the waste-book, to show how far the writing of the journal is advanced.

Secd. IV. Of POSTING and BALANCING the LEDGER.

31. The first thing to be done in the ledger, is to allot a proper space for each account. The accounts may be either opened in the same order that they oc-

cur in the journal; or accounts of the same kind may be placed together, the personal accounts on one part of the ledger, and the real accounts in another. The accounts of Stock, and Profit and Loss, are generally placed at the beginning. The room which each will require cannot be exactly known, but must be conjectured from the number of transactions that are likely to follow.

The number of the folio is marked in strong text at each corner of the top-line; and the titles of the accounts are written in fair text through both folios, if necessary. The designations of the personal accounts may be written on half text, or Italian hand; and some write the titles in Saxon hand, for ornament. The word *Dr.* is prefixed to the title on the left-hand page; and *Contra Cr.* annexed to it on the right-hand page.

32. Next, An Index must be provided, for pointing out the folios where the accounts are opened. The titles of the accounts are entered alphabetically in the index, and the number of the folio annexed. Personal accounts are entered by the first letter of the surname; companies, by the first letter of the surname of the first partner; and all other accounts, by the first letter of the first word. The most convenient kind of index is a long narrow book, of 24 leaves, one for each letter of the alphabet. A is marked on the top of the first leaf, and the paper pared away below it; B is marked on the second leaf, under A; and the other letters on the following leaves, in the same manner; by means of which we can turn at once to any letter required.

33. In posting the ledger, proceed by the following directions. First, look for the *Dr.* of the journal-post in the index, under the proper letter, and this directs you to the folio of the ledger where the account is, if it be already opened: if not, you must allot a space for it, write the title, and enter it in the index. Then enter the article on the left-hand page of the account under the title of the former article, by writing the date on the margin, and the name of the creditor on the line, with the word *To* prefixed, and a short narration of the transaction annexed, and inserting the sum in the money column, and the quantity, if it be an account of goods, in the inner column. Then turn to the account of the *Cr.* of the journal-post, and enter the article in the right-hand page, prefixing the word *By* to the name of the *Dr.*

34. This being done, turn to the journal, and mark on the margin the number of the folios to which the article is posted. The figures which point out the reference to the *Dr.* and *Cr.* folios should be separated by a line: for example, If the *Dr.* entry be on the third folio, and the *Cr.* entry on the fifth, the reference is marked $\frac{3}{5}$. These figures show how far the posting is advanced, and are useful in comparing the books.

The figures for dates or references should be written in a lighter hand than the figures in the columns for money or quantity.

35. There is often a reference-column ruled in the ledger, for pointing out the other entry, corresponding to any article. In this column, the folio of the *Cr.* entry is marked against the *Dr.* article, and the folio of the *Dr.* entry against the *Cr.* article.

Sometimes

Sometimes the accounts are numbered according to their order in the ledger; and the references, both in the journal and ledger, point out the number of the account instead of the folio.

36. In complex posts, turn to the several Drs. or Crs. in their order, and enter the articles according to the foregoing directions; placing the sums belonging to each in the money-column, against the respective entries.

37. An article in the ledger is generally comprehended in one line. The narration should be as full as can be contained in that bounds. If it cannot be narrated completely, the journal is referred to for further particulars, by writing *per Journal*, (or *p. J.*), either after an incomplete narration, or immediately after the Dr. or Cr. when there is no room for a proper narration. In complex posts, there can seldom be any narration annexed to the single Dr. or the single Cr. The entry is generally *To Sundries per J.* or, *By Sundries per J.* If the sense of the whole article can be narrated, it should be done; but it is improper to narrate the first or any other part of the article, and omit the others.

38. When the space allotted for an account in the ledger is filled up, the account must be transported to another folio. For this purpose add the columns on both sides, and write against the sum, *Transported to folio*, inserting the number of the folio where the new account is opened, in the reference-column, or on the line, if no reference-column be used. Then, after titling the new account, and entering the number of the folio in the index, write on the Dr. *To amount, brought from folio*, inserting the number of the folio where the old account was; and on the Cr. *By amount, brought from folio*; and place the sums, and quantities, if any, in the proper columns.

When either side of an account is full, both sides should be transported, and diagonal lines drawn, to fill up the vacant space of the side which requires it.

39. The books should be written up as frequently as can be done conveniently; so that the journal may keep pace nearly with the walter-book, and the ledger with the journal. Each book should be carefully revised, and compared with the book from which it is posted. In comparing the ledger, observe the following directions:

Begin with the first journal-post, and turn to the folio of the ledger where the Dr. is entered, which you are directed to by the marginal reference, and compare the date, entry, and sum. If you find them to correspond, it is well; if not, the ledger must be altered till it correspond with the journal. Then place a dot before the reference-figure in the journal, and a mark Δ before the sum in the ledger.

Proceed in the same manner to compare the Cr. of the journal-post, and all the following posts in their order. The dots in the journal show how far the comparison is advanced, and the marks in the ledger show what articles are compared.

The sums of accounts transported should be left blank till the books be compared; as an error in any article will occasion an alteration in the sum.

40. Some accountants correct all errors in the ledger, without erasing any thing, by the following methods: 1st, If the sum be entered too small, they make

a second entry for the deficiency. 2^d, If it be entered too large, they make an entry on the opposite side for the excess. 3^d, If it be entered on the wrong side of the account, they enter it twice on the other; once, to counterbalance the error, and a second time for the true entry. 4th, If it be entered on a wrong account, they charge the wrong account Dr. to, or Cr. by, the right one.

41. We do not much approve of these methods, as they give the books a confused appearance; and would rather recommend the following rules: 1st, If an article be omitted, do not attempt to interline at the place where it should have been; but insert it under the last article when you discover the omission, and mark a cross \times against it on the margin, and another at the place where it should have been. 2^d, If you discover a mistake immediately when committed, correct it without cancelling any thing, as in this example. *To Cash, for, To James Speirs received to account.* 3^d, If you have written a line entirely wrong, or in a wrong place, write the word *Error* at the end, prefix a cross, and omit or cancel the sum. 4th, Cancel errors, by drawing a line lightly through them, so that the old writing may still be legible; by which it will be evident, that the book has not been vitiated for a fraudulent purpose. The same method should be followed in correcting errors in the journal.

42. When the comparison of the books is finished, glance over the ledger, to observe if the mark of comparison be affixed to every article. If not, you must turn to the journal, and observe if the articles be right which had not been marked.

43. Because the whole sum of the Dr. side of the ledger should be equal to the whole sum of the Cr. § 14. it is proper to try if they correspond. For this purpose, you may add the Dr. of every account, except such as are already balanced, placing the sums in an inner column, and extending them at the end of one or more folios, as you find most convenient, to the outer column: and, as you go along, add the Cr. in the same manner. If the sum total of both sides be equal, it gives a presumption that the books are right; if they differ, there is certainly some mistake. This is called the *Trial-balance*. The labour bestowed upon it is not lost, as the sums may be referred for assisting us to collect the balances; the method of which will be explained afterwards.

44. If the sums of the trial-balance do not correspond, the books must be examined again. For this purpose, begin with the first article on the Dr. side of the first account, and turn to the account where the corresponding entry is, which you will find by the figure in the reference-column. If the articles agree, mark them with a dot. Proceed in like manner with the other articles on the Dr. of the first account; then with the articles on the Cr. of the same; and then with the following accounts in their order, till the error or errors be discovered. In complex entries, observe if the amount of the sums on one side be equal to the sum on the other. When you come to a dotted article, you may pass it by, because it has been examined already.

If the errors be not discovered at the first revival, you must repeat the same operation again, till you bring the books to balance. Marks different from the former ones,

lines, or differently placed, may be used, to signify that an article has been examined a second or third time. As the detection of errors is the most tedious and disagreeable part of book-keeping, the accountant will be induced to guard against them with all possible care, when he has once experienced the trouble which they occasion.

45. Before we explain the method of balancing the books, it will be proper to direct the learner how to balance particular accounts. When we settle accounts with any person, and ascertain how much is owing at either hand, it is necessary to balance his account in the ledger, and open a new one, beginning with the sum that was due according to the settlement; and when we clear accounts again, we must go back to that article, and no farther.

If any articles be charged on either side, at the time of settling, they must be immediately entered on the waste-book; from which they will pass in course to the journal and ledger; and a remark must be entered in the waste-book, that the account was settled, and the balance transferred to the proper side of the new account. This remark is transcribed in the journal; and the ledger account is balanced, when it occurs, in the course of posting.

If the balance be due to you, write on the Cr. *By balance due to him to Dr. new account*, and insert the sum due you; after which, the amount of both sides will be equal. Add the account, placing the sums opposite to each other; and, if the sides be unequal, draw a diagonal line through the vacant space of the shorter side, and close the old account by drawing lines under the sums. Then open the new account immediately under the old one, or in a new folio if the old one be full, by writing on the Dr. *To balance of former account due by him*. If the balance be due by you to him, the entries are made on the opposite sides, with the necessary alterations. When the new account is opened in the same folio, it is unnecessary to repeat the title; but the year and month, as well as the day, are repeated at the date of the first article.

46. Sometimes when an account is balanced, one or more articles are left out on purpose: For example, goods lately bought on credit may be left out, and the settlement may only relate to articles of longer standing. When this is the case, if the articles omitted be on the Dr. of the ledger, we write on the Cr. thus, *By articles sold him since 1st January replaced*: and when we have balanced the account, and opened a new one, we write on the Dr. *To articles replaced at settling, furnished since 1st January*: or, if the articles were left out for any other reason, we explain the same in the narration. If the omitted articles be on the Cr. the like entries are made on the opposite sides. It should be noticed in the waste-book and journal when this operation is necessary.

47. When we post any common article from the journal, we enter the sum on the Dr. of one account, and on the Cr. of another: when we balance an account, we place the balance sum on the Dr. of the old account, and on the Cr. of the new one, or contrarywise: and when we replace an article, as above directed, to the Dr. or Cr. of the old account, we place it after balancing to the Cr. or Dr. of the new one. Thus, in these entries, as well as in common posts, there are like

sums entered on the Dr. and Cr. of the ledger, and the general equality of the sides is still preserved.

48. Merchants generally balance their books once a year. The design of this operation is, to collect the various branches of their business, diffused through the books, into a concise abstract; to ascertain their gain or loss since the last balance; and exhibit the present state of their funds. If the business be of such a kind, that most of the branches naturally come to an issue at a certain time of year, that time is the proper one for making the balance. Otherwise the end of the year, or the least busy time, may be chosen.

49. It is proper, before balancing, to settle as many personal accounts as possible: to clear all arrears and small charges; to take an exact inventory of the goods on hand, as far as can be done; and affix a moderate value to each article, according to the current prices at the time; such a value as you would be willing at present to buy for. It is more proper to value the goods on hand in conformity to the current prices, than at prime cost: for the design of affixing any value is to point out the gain or loss, and the gain is in reality obtained so soon as the prices rise, or the loss suffered so soon as they fall; therefore it is impossible to make up a just state of the affairs, unless the present prices be attended to.

50. These things being done, proceed to make the balance as follows: Prepare two sheets of paper, ruled with money-columns, in the form of Dr. and Cr.; write *Profit and Loss* as the title of the first, and *Balance* as the title of the second.

Prepare also some paper for computing the balances, and mark down the folios, titles, and sums of each account in the ledger, in a regular order. If a trial-balance was made, the sums may be transcribed from it. Pass by such accounts as are already closed; also the accounts of Stock and Profit and Loss, which are always the last of being balanced. Then subtract the lesser sum from the greater, and enter the difference on either of the sheets that the nature of the article points out, and on the side of that sheet which corresponds to the greater sum of the account. More particularly,

In personal accounts, enter the difference, which is the debt owing to you, or by you, on the proper side of the balance-sheet.

In the cash-account, enter the difference, which is the money in hand, on the Dr. side of the balance-sheet.

In accounts of goods or other property, if there be nothing remaining on hand, enter the difference, which is the gain or loss, on the proper side of the profit and loss sheet.

If the whole be still on hand, enter the present value on the Dr. of the balance-sheet; and, if this be different from the prime cost, charges included, enter the difference in the proper side of the profit and loss sheet.

If part be sold, and part on hand, place the value of the quantity on hand under the sum of the Cr. and add them. The sum is the whole return that will be obtained, if the rest of the goods be sold at the estimated value; and this, being compared with the sum of the Dr. which is the whole expence, shows the gain or loss. Enter the same in the proper side of the profit and loss sheet, and enter the quantity and value on hand on the Dr. of the balance-sheet.

Observe if the quantities in the inner columns be e-

equal on both sides, when the goods are all sold; or, if the difference, when only part is sold, be equal to the quantity on hand. If they correspond, you have a just account of the goods. If the Dr. be greater, there is something amissing, which you must enter on the Dr. of the balance-sheet, and mark the cause of the deficiency, as intake, waste, or the like. If the Cr. be greater, there is an excess, which you must enter on the Cr. of the balance-sheet, together with the occasion of it, as difference of measure, or the like.

In accounts subsidiary to profit and loss, enter the difference on the proper side of the profit and loss sheet.

When there is nothing written on one side of an account, enter the sum of the article or articles on that sheet which the kind of the account points out.

51. When you have collected all the balances, sum up both sheets, and add to the profit and loss sheet the sums of the profit and loss account in the ledger: then subtract the lesser sum of each sheet from the greater.

This being done, mark the sums of the stock-account on your computation-paper, and add thereto the balance of the profit and loss sheet on the side which corresponds with the greater sum of that account: then subtract the lesser sum from the greater. The remainder will be equal to the difference of the sides of the balance-sheet, if the books be right, and the balances exactly collected.

52. We shall prove that this equality must always hold, from the nature of the articles collected. The Dr. of the balance-sheet contains every kind of property belonging to you, and every debt owing to you; and the Cr. contains every debt owing by you: therefore the difference of the sides shows what your nett estate amounts to. The profit and loss sheet, when the articles from the ledger are included, contains every thing you have gained on the Cr. and every thing you have lost on the Dr.; and the difference of the sides is your nett gain or loss. The stock-account contained your effects and debts at the time the books were opened; and therefore, when the gain or loss is added to the proper side, it must show the extent of your nett estate at present. Thus the stock-account and the balance-sheet both point out how much you are worth at present; the one from your former stock, allowance being made for your gains or losses; the other from a view of your present effects and debts; and they will correspond, because both must be agreeable to the truth, if the books be correct.

53. Though the books must balance, if free from error, yet it is sometimes difficult to adjust them exactly, especially when the business is extensive, and the error trilling. If there be still a difference, which we do not think it worth while to make further search for, we may close the books, by making Profit and Loss Dr. or Cr. for the same. This introduces an article on one side of the ledger, which has none corresponding to it on the other, but is balanced by some undiscovered error.

54. The balance being struck, your next work is to close the books. Every article in the ledger should be posted from the journal; therefore, the most regular way of finishing both is by inserting the following articles in the journal, and posting them in the common manner to the ledger.

1st, *Profit and Loss Dr. to Sundries, for loss, on the*
N^o 50.

following accounts. The particulars are taken from the Dr. of the Profit and Loss sheet.

2d, *Sundries Dr. to Profit and Loss, for gain, on the following accounts.* The particulars are taken from the Cr. of the Profit and Loss sheet.

3d, *Balance-account Dr. to Sundries, for debts and property belonging to me.*

4th, *Sundries Dr. to balance-account, for debts due by me.* The particulars of this and the former are taken from the respective sides of the balance-sheet.

5th, *Profit and Loss Dr. to Stock for nett gain; or Stock Dr. to Profit and Loss, for nett loss.*

6th, *Balance-account Dr. to Stock, for nett stock.*

55. When the four first of these articles are posted in the ledger, all the personal, real, and subsidiary accounts will balance, and you may add them as you go along. In accounts of goods, if there be any deficiency, you must enter it on the Cr. in the inner column; and, if there be any outcome, you must enter it on the Dr. before you add the account. Then the sums of every account and every column on the opposite sides will be equal.

The only accounts that remain open are, *Profit and Loss, Stock, and Balance.* The fifth post balances the profit and loss account, and the sixth balances the stock-account. It was noticed, § 14. that the whole sums of Dr. and Cr. of the ledger are equal; and therefore, if the sides of every account, except one, be balanced, that one will balance of its own accord. The balance-account alone remains open, and, upon trial, you will find that the sides are equal. This affords an additional proof, or, at least, a different view, of what was demonstrated, with respect to the balance of the books, in § 52.

The lines above and under the sums, at a general balance, may be drawn with red ink; and, at the balancing of particular accounts, with black ink, for distinction.

56. Some chuse to insert the particulars of the profit and loss and balance sheets in the respective accounts of the ledger. If this be done, it is unnecessary to enumerate them also in the journal. — Some chuse to balance the accounts of goods, whenever the quantity is sold off; and we approve of this method, as it lessens the work at the general balance, which is always sufficiently laborious.

57. Thus is the state of a person's affairs brought together, in a short compass, under his view; and the articles of the balance-sheet supply materials for a new inventory. It is convenient, however, to alter the order, and arrange the real accounts together, and the personal ones together.

58. It is not necessary to begin new books, nor open the accounts anew, unless the old folios be full. The accounts may be continued in the former folios; but it is best to begin a new ledger, if the old one be not likely to hold all the business of the next year. When one comes to have several sets of books, it is common to distinguish them by the letters of the alphabet. The first waste-book, journal, and ledger, are marked A, the second, B; and so on.

In the following specimen, the waste-book and journal are placed on opposite pages, that the learner may easily compare them; and the rules are referred to by their numbers.

(1) WASTE-BOOK.
Edinburgh, JANUARY 1. 1789.

JOURNAL. (1)
Edinburgh, JANUARY 1. 1789.

INVENTORY of ready money, goods, and debts, belonging to James Oswald merchant in Edinburgh.

The present article, it is hoped, will appear sufficiently extended for a work of this nature. It contains the general principles of Italian book-keeping; and is sufficient to unfold the nature and design of that art to the speculative inquirer, to direct the accountant in common and easy cases, and prepare him for understanding those that are more complicated. In fact, if he has a clear apprehension of the sense of the transactions, the tendency of the journal-entries, and the import of the balances in the ledger, he will seldom be at a loss how to proceed.

Subsidiary Books used by merchants.

Though all merchant-accounts may be kept by the *Waste-book*, *Journal*, and *Leger*, alone; yet men of great business find it convenient, either for abridging these, or for other ends, to use some others, generally called *Subsidiary* or *Subservient Books*; the most common of which are these nine following, *viz.*

1. *Cash-book.* This book is kept in a folio form, like the ledger, and serves to abridge the cash-account there. On the left-hand page, or Dr. side, *Cash* is charged Dr. for all the sums received; and on the right-hand page, *Cash* is made Cr. for all the sums paid. Once a-week, or, which is more ordinary, once a month, this book is polled to the ledger; or, if you please, first to the journal, by two entries, *viz.* *Cash* Dr. to *Sundries*, for all the receipts, and *Sundries* Drs. to *Cash*, for all the payments. By this means the cash-account in the ledger will be so far contracted as to consist of 12 lines, *viz.* one for each month in the year.

2. *Book of Charges of Merchandize.* This book is only paged, and designed to abbreviate the cash-book. It contains particular charges on goods and voyages; such as carriage, custom, freight, cranage, wharfage, &c.: as also other expences that affect trade in general; such as, warehouse-rent, shop-rent, accountant's wages, postage of letters, and the like. At the end of each month the money-columns of this book are added up, and the sum carried to the credit-side of the cash-book.

3. *Book of House-expences.* This book is also paged, and designed likewise to ease the cash-book. It contains all disbursements for family provisions, servant's wages, house-rent, apparel, utensils, &c. The money-columns of this book are also added up at the end of each month, and the sum transferred to the credit-side of the cash-book.

4. *Invoice-book.* This book, which is used chiefly by factors, is paged, and contains doubles or copies of the invoices of goods sent to sea, or of goods received from abroad.

5. *Sales-book.* This book too is chiefly used by factors; and into it is polled, from the waste-book, the particular sales of every consigned cargo; by which means the several articles of a sale, that lie scattered in the waste-book, are brought together, and represented under one view, and that in a manner more full and minute than they are collected in the ledger account.

This book exhibits the sales of every consignment separately and by themselves: to which are subjoined the respective charges, such as freight, custom, the factor's commission, as also abatements allowed to buyers, &c. whose sum subtracted from the gross amount of sale gives the neat proceeds. From this book, when a cargo is sold off, an account of sales is drawn out, in order to be transmitted to the employer.

6. *Bill-book.* The design of this *Bill-book*, or *Month-book*, is to furnish a merchant with a ready way of knowing the time when bills or other debts become payable to or by him. It consists of 12 folios, one for each month in the year. The left-hand page contains the debts that fall due to the merchant in the month on the top, and the right-hand page contains the debts payable by him to others in the same month.

7. *Receipt-book.* In this book a merchant takes receipts of the payments he makes. The receipt should contain the date; the sum received, expressed in words at large, and also in figures in the money-columns; the reason why; and whether in full or in part; and must be signed by the person receiving. But there is no occasion to mention the merchant's name; for the book being his own, sufficiently implies that.

8. *Letter-book.* It is very imprudent in any person to send away a letter of business, without keeping a double of it to himself; and therefore to prevent the bad consequences of such a careless practice, merchants are provided with a large book in folio, into which is copied *verbatim* every letter of business before it be sent off. So that this book, together with the letters received (which must also be carefully kept in files or boxes), makes a complete history of all the dealings that pass betwixt a merchant and his correspondents; which may be very useful and necessary on many occasions.

9. *Pocket-book.* This is a small book, of a portable size, which a merchant carries in his pocket when business calls him abroad to a tavern, a fair, the country, or other places. In this he sets down the bargains he makes, the expences he is at, the debts he pays, or sums he receives, with every other part of business he transacts while abroad; as also any occurrence or piece of news he thinks worth while to record. And when he comes home to his counting-house or shop, he transfers the things contained in this book, each to their proper places in the waste-book, or books subsidiary.

Factors of great business sometimes keep another small book, called the *Memorandum-book*. Into this book is copied, from letters as they come to hand, short notes of the several commissions for buying goods contained in them; and as the commissions are effected, the notes are crossed, or have some mark affixed to them. This is more convenient in doing business, than to be continually running to the letters themselves.

The above are the subsidiary books most in use: but a merchant is not tied down or restricted to them; he may keep some, and neglect others, or invent more as the nature of his business requires, and he finds convenient.

B O O

BOOKSELLER, one who trades in books, whether he prints them himself, or gives them to be printed by others.

B O O

BOOKSELLERS, among us, are the same with *billi-pole* among the ancients, whose office was distinct from that of *librarii*. Petty dealers, or vendors of small

Bookfeller. ware, like our publishers, were more particularly denominated *libellions*. At Rome, the Argiletum was the mart of books, as Paul's Church-yard, or Fleet-street, and Paternoster-row, have been among us: whence that of Martial,

*Argiletanas maxis habitare tabernas,
Cum tibi. parve liber, scriinia nostra vacent.*

Bookfellers in many places are ranked among the members of universities, and intitled to the privileges of students: as at Tubingen, Salisburg, and Paris, where they have always been distinguished from the vulgar and mechanical traders, and exempted from diverse taxes and impositions laid on other companies.

Formerly, the offices of bookfellers and printers were united in the same persons. Labbe gives a list of learned bookfellers; most of whom were also authors. Of late, bookfellers have drawn their business into less compass, and leaving the labour of composing books to one set of persons, and that of printing them to another, content themselves with the gainful part; thus ministering to the republic of letters not with the head or the hand, but the purse only. In this view, they have been very important and useful agents between authors and the public; and have contributed, in no small degree, to the encouragement of genius and literary industry, and the spread of science. There are few authors, who have undertaken the printing and publishing of any work likely to be transmitted to posterity, without being connected with some bookfeller, or bookfellers, eminent in their profession.

The fairs of Francfort and Leipzig are famous for the resort of bookfellers, not only from all parts of the empire, but Holland, Flanders, &c. They have each their shop or warehouse, over which is inscribed the name of some celebrated bookfeller of former times; *officina, Elseviriana, Frobeniana, Moralliana, Janseniana*, &c.

An acquaintance with the bookfellers marks or signs, frequently expressed on the title-pages of their books, is of some use; because many books, especially in the last century, have no other designation either of printer, bookfeller, or even city. The anchor is the mark of Raphelengius at Leyden; and the same with a dolphin twisted round it, of the Mutii at Venice and Rome; the Atrion denotes a book printed by Oporinus at Basil; the caduceus, or pegasus, by the Wecheluses at Paris and Francfort; the cranes, by Cramoisy; the compass, by Plantin at Antwerp; the fountain, by Vascosan at Paris; the sphere in a balance, by Janson or Blaeu, at Amsterdam; the lily, by the Juntas at Venice, Florence, Lyons, and Rome; the mulberry-tree, by Mord at Paris; the olive-tree, by the Stephanes at Paris and Geneva, and the Elms at Amsterdam and Leyden; the bird between two serpents, by the Frobeniuses at Basil; the truth, by the Commelins at Heidelberg and Paris; the Saturn, by Colinaus; the printing-press, by Budius Ascencius. &c.

The traffic of books was anciently very inconsiderable, inasmuch that the book-merchants of England, France, Spain, and other countries, were distinguished by the appellation of *stationers*, as having no shops, but only stalls and stands in the streets. During this state, the civil magistrates took little notice of the bookfellers, leaving the government of them to the univer-

sities, to whom they were supposed more immediate retainers: who accordingly gave them laws and regulations, fixed prices on their books, examined their correctness, and punished them at discretion. But when, by the invention of printing, books and bookfellers began to multiply, it became a matter of more consequence; and the sovereigns took the direction of them into their own hands, giving them new statutes, appointing officers to fix prices, and granting licences, privileges, &c.

BOOM, in the sea language, a long piece of timber with which the clew of the studding sail is spread out; and sometimes the boom is used to spread or boom out the clew of the main-mast.

BOOM, denotes also a cable stretched athwart the mouth of a river or harbour; with yards, top-masts, battling or spars of wood lashed to it, to prevent an enemy's coming in.

BOOMING, among sailors, denotes the application of a boom to the sails. A ship is said to come booming forwards, when she comes with all the sail she can make.

BOONEN (Arnold), portrait painter, was born at Dort in 1669, and at first was a disciple of Arnold Verbuis, a painter of history and portrait. Afterwards he placed himself with Godfrey Schaleken, and continued with that artist for six years. The sweetness of his colouring, and the neatness of his touch, with a striking likeness in his portraits, procured him a number of admirers. He painted in the manner of his master, particularly subjects by candle-light, which were very delicate, and very natural; and much more of his work was requested by the lovers of the art than it was possible for him to undertake. He had the honour to paint the portraits of the Czar of Muscovy; of Fiederic I. King of Prussia; of the victorious Duke of Marlborough, as well as many of the princes of Germany; and most of the noblemen who attended the Czar. His style of colouring was extremely good, and he had an elegant manner of disposing the attitudes of his figures; his handling was neat, and the whole had so much harmony that he was justly ranked among the ablest artists of his time. The small pictures of Boonen are in the taste of his master Schaleken; but his excessive application, to answer the multitude of his engagements, impaired his health, and destroyed while it enriched him. He died in 1729.

BOOPHTHALMUS, a kind of agate with large circles in it, bearing some resemblance to an ox's eye, from whence it has got this name.

BOOPS, in zoology, the trivial name of a species of balæna. See **BALÆNA**.

BOOSHATTER, formerly the city of Utica, famous for the retreat and death of Cato, lies about seven miles inland from **PORTO FARINA** in the bay of **TUNIS**. Nothing remains of its ancient grandeur except part of a large aqueduct, some cisterns, and other magnificent ruins, which cover a large extent of ground, and show it to have been a very considerable place. The sea, it is known, came up anciently to this city, though now seven miles distant.

BOOT, a leathern cover or defence for the leg, used on horseback, both to keep the body more firm, and defend the part from the injuries of the weather. Boots

seem to have taken their name from the resemblance they bear to a sort of jacks or lathern bottles formerly in use, and called *bottes*, in the old French *bouts*. Borel derives the name from the old French word *bot*, a slump, by reason the boot gives the leg this appearance. The Chinese have a kind of boots made of silk or fine stuff lined with cotton, a full inch thick, which they always wear at home. This people are always booted; and when a visit is made them, if they happen to be without their boots, their guests must wait till they put them on. They never stir out of doors without their boots on; and their scrupulousness in this respect is the more remarkable as they are always carried in their chairs.

The boot was much used by the ancients, by the foot as well as by the horsemen. It was called by the ancient Romans *ocrea*; in middle-age writers, *greva*, *gamberia*, *hainberga*, *benbarga*, or *benbarga*. The boot is said to have been the invention of the Carians. It was at first made of leather, afterwards of brass or iron, and was proof both against cuts and thrusts. It was from this that Homer calls the Greeks *brazen-boots*. The boot only covered half the leg; some say the right leg, which was more advanced than the left, it being advanced forwards in an attack with the sword; but in reality it appears to have been used on either leg, and sometimes on both. Those who fought with darts or other missile weapons, advanced the left leg foremost, so that this only was booted.

Fishing-Boots, are a thick strong sort used in dragging ponds, and the like. *Hunting-boots*, a thinner kind used by sportsmen. *Jack-boots*, a kind of very strong boots used by the troopers.

Boot, is likewise a kind of torture for criminals; to extort a confession, by means of a boot, stocking, or bulkin of parchment; which being put on the leg moist, and brought near the fire, in shrinking squeezes the leg violently, and occasions intolerable pain.

There is also another kind of boot; consisting of four thick strong boards bound round with cords: two of these are put between the criminal's legs, and the two others placed one on the outside of one leg and the other on the other; then squeezing the legs against the boards by the cords, the criminal's bones are severely pinched, or even broken, &c.

The boot is now disused in England and Scotland; but it subsists still in some other countries.

Boot-Tree, or *Boot-laff*, an instrument used by shoemakers to widen the leg of a boot. It is a wooden cylinder slit into two parts, between which, when it is put into the boot, they drive by main force a wedge or quoin.

BOOTES, a constellation of the northern hemisphere, consisting of 23 stars according to Ptolemy's catalogue, of 18 in Tycho's, of 34 in Bayer's, of 52 in Hevelius's, and of 54 in Mr Flamsteed's catalogue.

BOOTH (Barton), a famous English actor, born in Lancashire in 1681, and educated in Westminster school under the celebrated Dr Bulby, where his success in the Latin plays customarily performed by the scholars gave him an inclination for the stage. He was intended for the church; but running away from school to Dublin, he there commenced actor. His first appearance was in the part of Oroonoko, in which he came off with every testimonial of approbation from the

audience. From this time he continued daily improving; and, after two successful campaigns in that kingdom, conceived thoughts of returning to his native country, and making a trial of his abilities on the English stage. To this end, he first, by letter, reconciled himself to his friends; and then, as a farther step towards insuring his success, obtained a recommendation from Lord Fitzharding (one of the lords of the bed-chamber to prince George of Denmark) to Mr Betterton, who with great candour and good nature took him under his care, and gave him all the assistance in his power. The first part Mr Booth appeared in at London was that of Maximus in Lord Rocheiter's *Valentinian*, his reception in which exceeded even his most sanguine expectations; and very soon after his performance of *Artaban*, in Rowe's *Ambitious Stepmother*, which was a new tragedy, established his reputation, as second at least to his great instructor. *Pyrrhus*, in the *Distressed Mother*, was another part in which he shone without a rival. But he was indebted to a happy coincidence of merit and chance, for that height of fame which he at length attained in the character of Cato, as drawn by Mr Addison, in 1712. For this play being considered as a party one, the Whigs, in favour of whose principles it was apparently written, thought it their duty strongly to support it, while at the same time the Tories, who had too much sense to appear to consider it as a reflection on their administration, were still more vehement in their approbation of it, which they carried to such an height, as even to make a collection of 50 guineas in the boxes during the performance, and present them to Mr Booth, with this compliment, "That it was a slight acknowledgement for his honest opposition to a perpetual dictator, and his dying so bravely in the cause of liberty." Besides this, he had a present of an equal sum from the managers, in consideration of the great success of the play, which they attributed in a good measure to his extraordinary merit in the performance; and certain it is, that no one since that time has ever equalled, or even nearly approached, his excellence in that character.— But these were not the only advantages which were to accrue to Mr Booth from his success in this part; for Lord Bolingbroke, then one of the principal secretaries of state, in a little time after procured a special licence from queen Anne, recalling all the former ones, and nominating Mr Booth as joint manager with Wilks, Cibber, and Dogget; none of whom were pleased at it; but the last especially took such disgust as to withdraw himself from any further share in the management. In 1704, Mr Booth had married a daughter of Sir William Barkham Bart. who died in 1710, without issue. Being now established in the management, he once more turned his thoughts towards matrimony; and in the year 1719 united himself to the celebrated Miss Hester Santlow, a woman of a most amiable disposition, whose great merit as an actress, added to the utmost discretion and prudential economy, had enabled her to save up a considerable fortune. During the 20 years in which Mr Booth continued a manager, the theatre was in the greatest credit; and his illness and death, which happened on the 10th of May 1733, contributed not a little to its decline.

Mr Booth wrote a dramatic entertainment called *Diva and Eunus*; but his master-piece was a Latin in-

Booty
||
Borak.

scription to the memory of Mr William Smith, a celebrated actor, who died while he was young.—As an actor, his excellency lay wholly in tragedy, not being able to endure such parts as had not strong passion to inspire him. And even in this walk, dignity rather than complacency, rage rather than tenderness, seemed to be his taste. For a particular idea of his abilities, we must refer to the description Mr Cibber has given of him in his Apology; and the admirable character drawn of him by that excellent judge of dramatic perfection, Aaron Hill, Esq; in a political paper published by him called the *Prompter*, which may be seen at length in Theoph. Cibber's Lives of the Poets, and Chetwood's History of the Stage.—His character as a man was adorned with many amiable qualities, among which, a goodness of heart, the basis of every virtue, was remarkably conspicuous; and so particularly was he distinguished and carested, and his company sought by the great, that, as Chetwood relates of him, not one nobleman in the kingdom had so many sets of horses at command as he had.

BOOTY, whatever is taken from an enemy in time of war.—Among the Greeks, the booty was divided in common among the army, the general only claiming a larger share. By the military discipline of the Romans, spoils taken from the enemy belonged to the republic, particular persons having no right to them. The generals who piqued themselves on their probity carried it wholly to the public treasury. Sometimes indeed they divided it among the soldiery, to animate them, and serve in lieu of a reward. But this distribution depended on the generals, who were to conduct themselves herein with great equity and moderation; otherwise it became a crime of peculate to lay hands on the pillage, as regularly belonging only to the state. The consuls Romulus and Vatinus were condemned for having sold the booty taken from the Aequi.—Among the Jews, the booty was divided equally between the army and the people, though under the kings a different kind of distribution obtained.—Among the Mahometans, two thirds of the spoils are allowed to the army: the other third to God, to Mahomet and his relations, and to the orphans, the poor, and the pilgrims.—Among us, formerly the booty was divided among the soldiery. If the general be in the field, every body takes what he can lay hold on: if the general be absent, the booty is distributed among the soldiery, two parts being allowed to the cavalry, and one to the infantry. A captain is allowed ten shares, a lieutenant six, and a cornet four.

BOPPART, a town of Germany, in the circle of the Rhine, and electorate of Treves; it is seated at the foot of a mountain near the Rhine, in E. Long. 7. 35. N. Lat. 50. 19.

BOPSINGEN, a town of Suabia in Germany, seated on the river Egar, in E. Long. 9. 55. N. Lat. 48. 51.

BOQUINIANS, in church-history, a sect of heretics, so called from Boquinus their founder, who taught that Christ did not die for all mankind, but only for the faithful, and consequently was only a particular Saviour.

BORAGO, in botany, a synonyme of the ANCHUSA.

BORAK, among Mahometans, a fabulous animal,

supposed to be of the middle kind between an ass and a mule, whereon their prophet was carried in his nocturnal flight from Jerusalem into the heavens. This animal the Arabians call *Al Borak*, q. d. *shining*. The night when the journey was performed is called *Lailat al Meeraga*, i. e. *the night of ascension*; and the flight itself *Al Mejra*; concerning which there are a multitude of traditions.

BORAX, in chemistry, a salt in appearance somewhat similar to crystals of alum, brought originally from the East Indies in an impure state, and afterwards freed from its impurities by certain processes in the European countries. It was long a matter of uncertainty whether this salt be a natural or factitious substance in those countries from whence it is brought; but it is now beyond a doubt, that it is naturally produced in the mountains of Thibet, from whence other parts of the eastern continent are supplied. Mr Kirwan, in his mineralogy, informs us, that Mr Grill Adamson sent some to Sweden in the year 1772, in a crystalline form, as dug out of the earth in the kingdom of Thibet, where it is called *ponna*, *my pon*, and *kou pon*. It is said to have been found in Saxony in some coal-pits.

In the Philosophical Transactions, vol. 77. we have two different accounts of the place where it is found, and the manner of obtaining it. One of these is by William Blane, Esq; who tells us that in the language of the country it is called *swazah*, and is brought into Hindostan from the mountains of Thibet. It is produced in the kingdom of Jumlate, about 30 days journey north from Betowle, a small principality about 200 miles N. E. of Lucknow. The place where it is found is said to be a small valley surrounded with snowy mountains, in which is a lake about six miles in circumference; the water of which is constantly so hot that the hand cannot bear it for any time. Around this lake the ground is perfectly barren, not producing even a blade of grass; and the earth is so full of a saline matter, that after falls of rain or snow it concretes in white flakes on the surface like the natron of Hindostan. On the banks of this lake, in the winter season, when the falls of snow begin, the earth is formed into small reservoirs six inches high: when these are filled with snow, the hot water from the lake is thrown upon it; which, together with the water from the melted snow, remains in the reservoir, to be partly absorbed by the earth and partly evaporated by the sun; after which there remains at the bottom a cake of sometimes half an inch thick of crude borax, which is taken up and reserved for use. It can only be made in the winter season, because the falls of snow are indispensably requisite, and also because the saline appearances upon the earth are strongest at that time. When once it has been made on any spot, it cannot be made again on the same until the snow has fallen and dissolved three or four times, when the saline efflorescence appears as before. The borax, in the state in which it is taken off the earth, is carried from hill to hill upon goats, and passes through many hands, which increases the difficulty of obtaining any authentic information concerning the original manufacture. When brought down from the hills, it is refined from the gross impurities by boiling and crystallization. Our author could obtain no answer from those who gave him the account, to any of his questions concerning the quality of the wa-

Borax.

Borax.

ter and the mineral productions of the soil. All they could tell him was, that the water was very hot, very foul, and as it were greasy; that it boils up in many places, and has a very offensive smell; and that the soil is remarkable only for the saline appearances already mentioned. The country in general produces considerable quantities of iron, copper, and sulphur; and our author was assured that all the borax in India came from this place.

As this part of A^da is entirely unfrequented by Europeans, our author could only obtain his information from the natives: however, as he had an opportunity of seeing some of those who resided near the spot, it might be reckoned as genuine as could well be expected. The place, he tells us, is inaccessible not only to the Europeans, but even to the inhabitants of Indostan, being never visited by any of them except a few wandering Saquirs, who have been sometimes led there, either with a view to visit some of the temples in the mountains, or to do penance. They describe the cold in winter to be so intense, that every thing is frozen up; and life can only be preserved by loads of blankets and skins. In the summer, again, the reflection of heat from the sides of the mountains, which are steep and close to one another, renders the heat intolerable. With respect to the credibility of the account, he observes, first, "That borax is really brought from the mountains of Thibet is certain, as he himself often had occasion to see large quantities of it brought down, and had purchased it from the Tartar mountaineers, who brought it to market; secondly, he had never heard of its being produced or brought into India from any other quarter; and, thirdly, if it was made on the coast of Coromandel, as some books mention, he thinks there can be little doubt but that the whole process would have been fully inquired into, and given to the public long before this time."

The other account is from father Joseph de Ravato, president of the mission of Thibet, and sent in a letter to the Royal Society, communicated by Joseph Banks, Esq; He pretends also to have had his intelligence from a native of the country where the borax is made, though it differs very considerably from that of Mr Blanc. "In the province or territory of Marme (says he), 28 days journey to the north of Nepal, and 25 to the west of Lassa, the capital of Thibet, there is a vale about eight miles broad. In a part of this vale there are two villages or castles, the inhabitants of which are wholly employed in digging the borax which they sell into Thibet and Nepal, they having no other means of subsistence, the soil being so barren as to produce nothing but a few reeds. Near these two castles there is a pool of a moderate size, and some smaller ones, where the ground is hollow and the rain-water collects. In these pools, after the water has been some time detained in them, the borax is formed naturally: the men wading into the water, feel a kind of a pavement under their feet, which is a sure indication that borax is there formed; and there they accordingly dig it. Where there is little water, the layer of borax is thin; where it is deep, it is thicker; and near the latter there is always an inch or two of soft mud, which is probably a deposit of the water after it has been agitated by rain or wind. Thus is the borax produced merely by nature, without either boiling or distillation.

The water in which it is formed is so bad, that the drinking a small quantity of it will occasion a swelling of the abdomen, and in a short time death itself. The earth that yields the borax is of a whitish colour; and in the same valley, about four miles from the pools, there are mines of salt, which is there dug in great abundance for the use of all the inhabitants of these mountains, who live at a great distance from the sea. The natives, who have no other subsistence on account of the sterility of the soil, pay nothing for digging borax; but strangers must pay a certain retribution, and usually agree at so much per workman. Ten days journey farther north, there is another valley named *Tapre*, where they dig borax; and another still farther to the northward, named *Cizga*. Borax, in the Hindoo and Nepalese languages, is called *Seaga*. If it be not purified, it will easily deliquesce; and in order to preserve it for any time till they have an opportunity of selling it, the people often mix it with earth and butter. In the territory of Mungdan, 16 days' journey to the north of Nepal, there are rich mines of arsenic; and in various other places are found mines of sulphur, as also of gold and silver, whose produce is much purer than those of the mines of Pegu."

Mr Fourcroy informs us, that borax is found in commerce in three different states. 1. Crude borax, tincal, or chrysocolla, which comes from Persia. He describes it as consisting of a greenish mass of a greasy feel, or in opaque crystals of an olive green, which are six-sided prisms terminated by irregular prisms. There are two varieties of these crystals, differing in magnitude: this salt is very impure by the addition of foreign matters. Mr Kirwan tells us, that this kind is called *brut: borax, tincal, or chrysocolla*, and that it is in the form of large, flat, hexangular, or irregular crystals, of a dull white or greenish colour, greasy to the touch; or in small crystals, as it were cemented together by a rancid, yellowish, oily substance, intermixed with mud, gravel, and other impurities. Mr Engelstrom, he adds, has a suspicion that the tincal is only the residuum of the mother liquor of borax evaporated to dryness; and that the greasiness arises from its being mixed with butter-milk, to prevent its efflorescence.

2. Borax of China is somewhat purer than the foregoing, and is met with in the form of small plates or masses irregularly crystallized, and of a dirty white. It appears to consist of fragments of prisms and pyramids, confounded together without any symmetrical arrangement: a white powder is observed on the surface, which is thought to be of an argillaceous nature.

3. The Dutch or purified borax, is in the form of portions of transparent crystals of considerable purity. Pyramids with several facets may be observed among them, the crystallization appearing to have been interrupted. "This form (says Mr Fourcroy) shows to a certainty that the Dutch refine this salt by solution and crystallization."—Mr Kirwan says, that it is purified by solution, filtration, and insalidization; and the crystals thus obtained are calcined, to free them still farther from greasiness; and then dissolved, filtered, and crystallized, a second time. Sometimes more mineral alkali is added, as tincal is said to contain an excess of sedative salt. Mr Fourcroy tells us, that a purified borax, not inferior to the Dutch, but perhaps

Borax.

Borax.

even of greater purity, is prepared by some chemists at Paris.

The same author informs us, that Mr La Piane, an apothecary at Paris, has discovered, that it is continually formed in the soap-suds and refuse-waters of the kitchen, which a person preserves in a kind of ditch; and from which, at the end of a certain time, he obtains true borax in fine crystals. "All that we can deduce (says he) from the known facts concerning its formation, is simply, that it is produced in stagnant waters which contain fat matters." Some authors affirm, that it is produced by art in China. A mixture of grease, clay, and dung, is said to be deposited in a ditch, *stratum superstratum*. This mixture is sprinkled with water, and suffered to remain for some years; at the end of which time it is lixiviated, and affords crude borax by evaporation. Others have supposed that it is obtained from water, which filters through copper mines. Mr Beaume positively asserts, that the former of these processes succeeded very well with him; but Dr Black gives little credit to his assertions.

Borax serves as a flux to vitrifiable earths, with which it forms a good glass, and is employed in making artificial gemis. It vitrifies clay, but much less completely than siliceous earths; and from this property it adheres to the insides of crucibles, and glazes them.

Borax, as is related at length under the article CHEMISTRY, is a peculiar neutral salt formed by the union of a kind of acid with mineral alkali. This acid, from some supposed properties of allaying the heat of fevers, had the name of *sal sedativus*, which it still retains. It has been supposed to be an artificial product, and perhaps may be artificially made*: but Mr Hoefler, apothecary to the grand duke of Tuscany, has discovered that the waters of several lakes of that country contain it in a state of great purity; and the chemists of the academy of Dijon have confirmed this discovery by analysing the waters of Monte Rotondo, which were sent to them; and in which they found sedative salt, as discovered by Mr Hoefler. It is probable (says our author) that it may hereafter be found in other mineral waters; and it seems to be produced by the putrefaction of fat substances.

Mr Hoefler first discovered this acid in the waters of the Lagoon named *Cerchiaio* near Monte Rotondo, of which discovery an account was published in the year 1778. The same was found, in a concrete state, by Mr Paul Mafgagni professor of Anatomy, in several streams of the Lagoon in the neighbourhood of Siena and Volterra. He enumerates six places; viz. the lake of *Travale*, 20 miles to the west of Siena; that of *Rotondo*, which lies 30 miles to the westward of the same town; of *del Saffè*, three miles further; at another called *Sarazzano*, six miles from Monte Rotondo; another named *Casfel Nuovo*, seven miles from Monte Rotondo and 24 from Siena; and that of *Monte Cerboli*, four miles distant from *Casfel Nuovo*. In the neighbourhood of all these lakes are considerable springs of hot water rushing out of the earth, some clear, and some muddy; either of a dark or a whitish colour; and, in some, a kind of metallic crust or pellicle is perceived on the surface of the water. Many cavities from which the waters rush out seem to be true small volcanic craters, and continually emit from the earth vapours of a sulphureous and ammoniacal na-

ture. These waters not only contain the acid of borax, both in the fluid and concrete state, but various other concretions are there observed, such as martial vitriol, ammoniacal, aluminous, concrete boracic salts, brimstone, &c.

"It is remarkable (says our author, p. 363.), that, near 40 years ago, Dr Hill, in his notes to *Theophrastus's Treatise on Stones*, asserted, that borax was a salt made by evaporation of an ill tasted and foul water, of which there were springs in Persia, Muscovy, and Tartary. But he was hardly believed, on account of the many bold and groundless assertions of which he had been found guilty in almost all his numerous works. Mr Beaumé at Paris pretended to have discovered the method of making the sedative salt by a long maceration of greasy and earthy substances; but nobody has yet been able to verify this fanciful discovery.

"The unrefined borax which is brought to Europe under the name of *tincal*, looks like soft soap, is fat, and covers or encrusts the borax crystals. The mineral matter, Mr Swab, has published some experiments upon this tincal in the acts of the Royal Academy of Sciences at Stockholm for 1756. He found in it a martial earth, and a fat substance, which, to smell and other circumstances, comes nearest to a mineral fat: as also, that pure borax does not yield any *hepar sulphuris* when united with a phlogiston and a vitriolic acid; from which he concludes, that borax is prepared from its own particular mineral substance.

"Professor Pott and M. d'Henouville have very carefully examined the refined borax; and from their experiments, which have been published, it is evident, that it is of a peculiar nature. However, there remains to be known, for certain, from whence it is prepared by the Indians: for if it is produced from a mineral substance, as is very probable, there must exist other mixtures and compositions as yet unknown to the learned world.

"I have also found in the tincal small bits of leather, bones, and small pebbles, whence there is no certainty to be concluded on from its examination; but if it should happen that it is prepared from animal substances, it must be allowed, that nature has formed an alkaline salt in the animal kingdom analogous to the *sal fusibile microcosmicum*. Some years ago a report was propagated from Saxony, that somebody had discovered there a substance out of which borax could be made, and also the art of preparing it: but nothing more has transpired since, than that the author showed it in secret to his friends, and gave a description of it which was only intended to mislead them, if he really did possess the art."

According to Mr Kirwan, 100 parts of purified borax contain 32 of real boracic acid, 17 of mineral alkali, and about 47 of water; but of this quantity of mineral alkali only about five parts are saturated; whence, in many cases, borax acts as an alkali. Bergman informs us, that it requires an equal weight of acid to make the alkaline properties entirely disappear; and Dr Withering, that double the quantity of acid is required for this purpose, both in the tincal and refined borax.

This acid, like the borax in substance, is made use of to fuse vitrifiable earths, with which it forms clear and nearly colourless glasses: by the assistance of heat it dissolves

Borax.

magus**
||
Borde.

dissolves the earth precipitated from the liquor of flints. It unites with ponderous earth, magnesia, lime, and alkalis, and forms, with these different substances, salts distinguished by one general name of borax, though only that formed by the combination of sedative salt and mineral alkali is used in the arts. It is used in many other chemical operations as a flux, besides that of glass-making; and the dyers also use it for giving a gloss to silks. In medicine it has been given as a narcotic, and was formerly an ingredient in a powder for promoting delivery, but is now disused.

BORBETOMAGUS, (anc. geog.), a city of the Vangiones on the Rhine; now *Worms*, in Germany.

BORBONIA, in botany: A genus of the decandria order, belonging to the diadelphia class of plants; and in the natural method ranking under the 32d order, *Caryophyllea*. The stigma is emarginated; the calyx has pointed spines; and the legumen is pointed.—There are six species, all of which are natives of warm countries. They are a kind of broom; and in the places where they grow naturally, they rise to the height of ten or twelve feet, but in Europe seldom rise more than four or five. They must be kept constantly in the stove, and may be propagated by laying down the young shoots; but as these are generally two years before they put forth proper roots, the most eligible method is by seeds, which must be procured from those places where they grow naturally, as they do not come to perfection in this country.

BORBORITES, in church-history, a sect of gnostics, in the second century, who, besides embracing the errors of these heretics, denied the last judgment. Their name comes from the Greek *Barbotes*, "filth;" on account of a custom they had of daubing their faces and bodies with dirt and filth.

BORCH, a town of the duchy of Magdeburgh in Lower Saxony, seated on the river Elbe, in E. Long. 12. 14. N. Lat. 52. 25.

BORCHLOEN, a town of the bishopric of Liege in Germany, situated in E. Long. 5. 28. N. Lat. 50. 50.

BORCOVIUM, (anc. geog.), a town of the Ottadini in Britain, now *Berwick on Tweed*.

BORD-HALFPENNY, a small toll by custom paid to the lord of the town for setting up boards, tables, booths, &c. in fairs and markets.

BORD Lands, the demesnes which lords keep in their hands for the maintenance of their board or table.

BORD Lode, a service required of tenants to carry timber out of the woods of the lord to his house. It is also used to signify the quantity of provision which the hordarii or bordmen paid for their bord lands.

BORD-Service, the tenure of bord-lands, by which some lands in certain places are held of the bishop of London, and the tenants now pay sixpence per acre, in lieu of sending provision anciently for their lord's table.

BORDAT, in commerce, a small narrow stuff, which is manufactured in some parts of Egypt, particularly at Cairo, at Alexandria, and Damietta.

BORDE (Andrew), a physician, was born at Pevensey in Suffex, early in the 16th century, and supposed to have been educated at Westminster school. In his *Introduction to Knowledge*, he says, that he was a student of Oxford; but of what college he does not

mention. He left the university without a degree, and entered himself a brother of a Carthusian convent in or near London; but, not liking the severe discipline of that order, he returned to Oxford, and applied himself to the study of physic. Some time after, he embarked for the Continent; and, as he himself expresses it, "travelled through and round about Christendom, and out of Christendom into some parts of Africa." In the years 1541 and 1542, he resided at Montpellier in France, where he was made doctor of physic, and after his return to England was incorporated into the same degree at Oxford. From the preface to his *introduction* above mentioned, it appears that he had been in Scotland, which probably was soon after his return from France. Having now satisfied his inclination for travelling, he settled first at Pevensey where he was born, afterwards at Winchester, and finally in London, where he is said to have become a fellow of the college of physicians, and first physician to king Henry VIII. But, notwithstanding his eminence in his profession, he had the misfortune to spend the latter end of his life in the Fleet prison, where he died in the year 1549. As to his character, Wood says, that "he was esteemed a noted poet, a witty and ingenious person, and an excellent physician." Pits calls him a man of sufficient learning, but too volatile and inconstant. Bale and some others, on the contrary, abuse him grossly. His writings are, 1. A book of the introduction of knowledge, the which doth teach a man to speak part of all manner of languages, &c. Lond. 1542, 4to; dedicated, from Montpellier, to the lady Mary daughter to Henry VIII. It is written partly in verse, and partly in prose, containing 39 chapters, before each of which is a wooden print of a man. 2. The breviary of health, wherein are remedies for all manner of sicknesses and diseases, &c. Lond. 1547, &c. 4to. 3. Dietary of health, Lond. 1576, 8vo. 4. The merry tales of the madmen of Gotham. Printed, says Wood, in the time of Henry VIII. in whose reign, and after, it was accounted a book full of wit and mirth by scholars and gentlemen. Afterwards being often printed, it is now sold only on the stalls of ballad-singers. 5. A right pleasant and merry history of the mylner of Abington, with his wife and his fair daughter, and of two poor scholars of Cambridge. Lond. printed by Richard Jones, 4to. 6. A book of every region, country, and province; which shows the miles and leagues distance from city to city, and from town to town, with the noted things in the said cities and towns. Wood says that the author lent the manuscript of this book to his friend Thomas Cromwell, who lost it, to the great grief of the author, who would otherwise have published it. In this instance, however, the antiquary was misinformed; for it has since been published by Hearne at the end of *Benedictus abbas Peterb. de vita Henrici II.* Oxf. 1735, 8vo. 7. The principles of astronomy, the which diligently persecuted is in a manner a prognostication to the world. Lond. printed by Robert Copland, 12mo. The author says that he wrote this little book in four days, with one old pen without mending.

BORDER, in gardening, is made to inclose parterres, that they may not be injured by walking in them. Borders are made either circular, straight, or in cants; and are turned into knots, scrolls, volutes, and other

Borduni
||
Borelli.

other compartments. They are rendered very ornamental by the flowers, shrubs, yews, &c. that are raised in them. They are always laid with a sharp rising in the middle; because, if they are flat, they are noways agreeable to the eye: and as for their breadth, the largest are allowed five or six feet, and the smallest commonly four.

BORDUNI, or BORDONE, (Paris), an excellent Italian painter, was born at Venice about the year 1512; and, being of a noble family, had a polite education. He was the disciple of Titian; but has been admired more for the delicacy of his pencil than for the truth of his outlines. He was at the court of France in the reign of Francis I. who had a great esteem for him, and for whom he drew not only abundance of history-pieces, but the portraits of several court-ladies, in so fine a manner, that original nature was hardly more charming. He at length returned to Venice, laden with riches and honour; and having gained great reputation in all parts of Italy, died in 1587, aged 75.

BORDURE, in heraldry. See there, n^o 10.

BORE, among engineers, denotes the diameter of the barrel of a gun or cannon, or rather its whole cavity.

BOREAS, a Greek name, now in common use for the north wind. Pezron observes, that anciently Boreas signified the *north-east wind*, blowing at the time of the summer solstice. The Greeks erected an altar to Boreas. He is represented on the temple at Athens with his robe before his mouth, as if he felt the cold of the climate over which he presides, agreeably to the description of Ovid, who calls him *gelidus tyrannus*, "the shivering tyrant," Met. vi. ver. 711. But he is usually described by the Roman poets as violent and impetuous; *ibid.* ver. 686—ver. 707. In painting, he is generally represented like an old man with a horrible look, his hair and beard covered with snow or hoar frost, with the feet and tail of a dragon. M. Spierlingius has a treatise in praise of Boreas, wherein he shows the honours paid to him by antiquity. Boreas, according to this author, purifies the air, renders it calm and salubrious, preserves buildings from decay, drives away the plague and other noxious diseases, and expels locusts and other vermin hurtful to the grounds.

BOREL (Peter), a learned physician, was the son of James Borel who published several poems, and was born at Castres in 1620. He applied himself to the study of physic, of which he was created doctor, and practised with great success in the city of Castres. Towards the end of the year 1653, he went to Paris, and was soon after made physician in ordinary to the king. In 1674, he was received into the academy of sciences, and distinguished himself by writing a great number of works. The most esteemed are, 1. *Historiarum & observationum medico-physicarum*. 2. *Bibliotheca chymica, duodecimo*. 3. *De vero telescopii inventore, cum brevis omnium conspiciendorum historia*. He died in 1678.

BORELLI (John Alphonso), a famous philosopher and mathematician born at Naples the 28th of January 1608. He was professor of philosophy and mathematics in some of the most celebrated universities of Italy, particularly at Florence and Pisa, where he became highly in favour with the princes of the

house of Medicis; but having been engaged in the revolt of Messina, he was obliged to retire to Rome, where he spent the remainder of his life under the protection of Christina queen of Sweden, who honoured him with her friendship, and by her liberality towards him softened the rigour of his hard fortune. He continued two years in the convent of the regular clergy of St Pantaleon, called the *picus schools*, where he instructed the youth in mathematical studies. He died there of a pleurisy, the 31st of December 1679, in the 72d year of his age. He wrote, in Latin, 1. Euclid restored. 2. The theory of the influence of the planets in medicine, deduced from physical causes. 3. Of percussive force. 4. Of natural motions depending upon gravity. 5. An historical and meteorological account of the burning of mount Ætna, in the year 1669. 6. Of the motion of animals; and several other works, some of which are in Italian.

BORGIA (Cæsar), natural son of pope Alexander VI. was a brave general, but a most abandoned villain. See (*History of*) ITALY.—It is incredible what numbers he caused to be taken off by poison, or by the sword; and it is notorious that swarms of assassins were constantly kept in pay by him at Rome, for the sake of removing all who were either obnoxious or inconvenient to him. He experienced various turns of fortune; and was sometimes very prosperous, sometimes the reverse. He very narrowly escaped dying by poison in 1503; for having concerted with the pope a design of poisoning nine newly created cardinals at once, for the sake of possessing their effects, the poisoned wine, destined for the purpose, was by mistake brought to and drank by themselves. The pope died of it; but Cæsar, by the vigour of his youth, and the force of antidotes, after many struggles, recovered. He only recovered to outlive his fortune and grandeur, to see himself depressed, and his enemies exalted; for he was soon after divested of all his acquisitions, and sent a prisoner to Spain, in order to free Italy from an incendiary, and the Italian princes from those dangers which the turbulent and restless spirit of Cæsar made them fear, even though he was unarmed. He escaped from thence; and got safe to Navarre, to king John his brother-in-law, who was then at war with his subjects. Cæsar served as a volunteer in that war, and was killed in 1507.

BORGIO, an ancient town of Sweden, seated on the gulf of Finland, in the province of Nyland. E. Long. 26. 25. N. Lat. 60. 34.

Borgio de St Sepulchro, a town of Tuscany, in Italy, situated in E. Long. 13. 0. N. Lat. 43. 30.

Borgio de val de Faro, a town of Italy, in the duchy of Parma, in E. Long. 10. 36. N. Lat. 44. 35.

Borgio-Porto, a town of the Mantuan in Italy, situated at the confluence of the rivers Po and Menzo. E. Long. 11. 0. N. Lat. 44. 50.

Borgio San Demino, a town of Italy, in the duchy of Parma, with a bishop's see. E. Long. 10. 31. N. Lat. 41. 53.

BORGOGNONE, a celebrated painter, whose true name was *Giacomo Cortesi*; but he is commonly called *Borgognone*, from the country where he was born, about the year 1605. He was much admired and highly applauded for his admirable gullo and grand manner of painting battles. He had for several years been con-

Borgia
||
Borgognone.

Boria
||
iffhence.

versant in military affairs, was an officer of considerable rank in the army, made the camp his school, and formed all his ideas from what he had seen performed in the field. His style is roughly noble, full of fire and spirit, and there are a few prints etched by his own hand. Towards the close of his life he retired to the Jesuits convent in Rome, where he is said to have taken sanctuary to rid his hands of an ill bargain he had got of a wife; but happily surviving her, he lived in great esteem and honour till after the year 1675.

BORIA, a small town of Spain, in the kingdom of Arragon. W. Long. 2. 2. N. Lat. 41. 50.

BORING, in a general sense, the art of perforating, or making a hole through any solid body.

BORING of Water-pipes. The method of boring water-pipes is as follows. The poles of alder, which is a very useful wood in making pumps, water-pipes, &c. being laid on horses or trassels of a foot height, to rest the augre upon while they are boring, they set up a lath to turn the least end of the poles, to fit them to the cavities of the great end of the others. They turn the small ends of the poles about five or six inches in length, to the size they intend to bore the bigger ends about the same depth, viz. five or six inches. This is designed to make a joint to shut each pair of poles together, the concave part being the female part, and the other the male of the joint. In turning the male part, they turn a channel in it, or a small groove at a certain distance from the end; and in the female part they bore a small hole to fit over this channel. This being done, they bore the poles through; and to prevent them from boring out at the side, they slick great nails at each end to be a guide in boring. It is usual, however, to bore them at both ends, so that if a pole be crooked one way, they can bore it through and not spoil it.

BORING, in surgery, a cruel and absurd method of treating a wrenched shoulder. See **FABRERY**, §. XXIII. 7.

BORING, in mineralogy, a method of piercing the earth with scooping irons, which being drawn back at proper times, bring up with them samples of the different strata through which they have passed; by the examination of which the skilful mineralogist will be able to guess whereabouts a vein of ore may lie, or whether it will be worth while to open a mine there or no.

BORIQUEN, one of the Caribbee islands in North America, near that of Porto Rico. The English formerly had a settlement there, but were driven away by the Spaniards. It is at present without inhabitants, though agreeable and fertile; the air being wholesome, and the water good. There are a great number of land-crabs, whence some have called it *Crab Island*. W. Long. 64. 35. N. Lat. 18. c.

BORISTHENES, (anc. geog.), the largest river of Sarmatia Europea, thus described by Mela, who copies *verbatim* from Herodotus: "It runs through a cognominal people, is the most pleasant of all the rivers of Scythia, and calmer than all of them in its course, and very agreeable to drink: it feeds very rich pastures, and produces large fish of the best flavour, and without bones: it comes a great way, rising from springs unknown; its course is a distance of 40 days, and so far it is navigable." It is now called the *Dnieper* or *Nieper*.

Borkel
||
Borlase.

BORKELO, a strong town in the United Provinces, in the county of Zutphen, seated on the river Borkel, in E. Long. 6. 30. N. Lat. 52. 15.

BORLASE (Dr Edmund), an eminent physician and English writer in the 17th century, was the son of Sir John Borlase, master of the ordinance, and one of the Lord Justices of Ireland in 1642. He studied in Dublin college, and afterwards, at the university of Leyden, at which last place he took the degree of doctor of physick. He afterwards practised physick with great success in the city of Chester, and was incorporated doctor of the faculty in the university of Oxford. Among the books which he wrote and published are the following. 1. *Latham Spaw in Lancashire*, with some remarkable cases and cures performed by it. 2. *The reduction of Ireland to the crown of England*. 3. *The history of the Irish rebellion*. 4. *Brief reflections on the earl of Castlhaven's memoirs*, &c. He died after the year 1682.

BORLASE (William), a very ingenious and learned writer, was of an ancient family in Cornwall, and born at Pendeen, in the parish of St Just. Feb. 2. 1695-6. He was put early to school at Penzance, and in 1709 removed to Plymouth. March 1712-13, he was entered of Exeter college, Oxford; and, June 1719, took a master of arts degree. In 1720, he was ordained a priest; and, in 1722, inducted to the rectory of Ludgvan in Cornwall. In 1732, the lord chancellor King presented him to the vicarage of St Just, his native parish; and this, with the rectory aforesaid, were all the preferments he ever had. In the parish of Ludgvan were rich copper works, which abound with mineral and metallic fossils; and these, being a man of an active and inquisitive turn, he collected from time to time, and thence was led to study at large the natural history of his native county. He was struck at the same time with the numerous monuments of remote antiquity that are to be met with in Cornwall; and, enlarging therefore his plan, he determined to gain as accurate an acquaintance as possible with the Druid learning, and with the religion and customs of the ancient Britons, before their conversion to Christianity. In 1750 he was admitted a fellow of the Royal Society; and, in 1752, published in folio at Oxford his "*Antiquities of Cornwall*;" a second edition of which was published, in the same form, at London, 1769, with this title, "*Antiquities, historical and monumental, of the county of Cornwall; consisting of several essays on the ancient inhabitants, Druid superstition, customs and remains of the most remote antiquity in Britain, and the British isles, exemplified and proved by monuments now extant in Cornwall and the Scilly islands; with a vocabulary of the Cornu-British language. Revised, with several additions, by the author; to which is added a map of Cornwall, and two new plates.*" His next publication was, "*Observations on the ancient and present state of the islands of Scilly, and their importance to the trade of Great Britain*;" Oxf. 1756, 4to. This was the extension of a paper which had been read before the Royal Society in 1753. In 1758 came out his "*Natural history of Cornwall*;" Oxf. 8. l. After these publications, he sent a variety of fossils and remains of antiquity which he had described in his works, to be deposited in the Museum

Bornio
||
Borneo.

musium: for which, and other benefactions of the same kind, he received the thanks of the university, in a letter from the vice-chancellor, Nov. 18. 1758; and, March 1766, the degree of doctor of laws. He died in 1772, aged 77 years, leaving two sons out of six, whom he had by a lady he married in 1724. Besides his literary connections with many ingenious and learned men, he had a particular correspondence with Mr Pope; and there is still existing a large collection of letters written by that poet to Dr Borlase. He furnished Pope with many of the materials which formed his grotto at Twickenham, consisting of curious fossils; and there may at present be seen Dr Borlase's name in capitals, composed of crystals, in the grotto. On which occasion Pope says to Borlase in a letter, "I am much obliged to you for your valuable collection of Cornish diamonds: I have placed them, where they may best represent yourself, *in a shade, but shining*;" alluding to the obscurity of the doctor's situation, and the brilliancy of his talents. Besides the above works, he sent many curious papers to the Philosophical Transactions, and had in contemplation several other works.

BORMIO, a county depending on the republic of the Grisons in Switzerland. It is bounded on the south by the estate of Venice, on the east by the territory of the house of Austria, and on the south and west by Caddea. It is 15 miles over both ways; and is divided into five communities, viz. the town of Bormio, the valley of Forbia, the Interior Valley, the Lower Valley, and the Valley of Luveno. Bormio is the only town in this district; and has a governor called a *podesta*, sent by the Grisons to preside in civil and criminal affairs. It is seated at the confluence of the rivers Addo and Malacna, in E. Long. 10. 10. N. Lat. 46. 45.

BORNE, a market town of Lincolnshire in England. W. Long. 0. 20. N. Lat. 52. 40.

BORNEO, an island of Asia, in the East Indies, and one of the three great Sunda islands. It is thought to be the largest island in the world, next to New Holland; being 3500 miles in circumference. It is seated under the equator, that line cutting it almost through the middle. It is almost of a circular figure; abounds with gold; and the finest diamonds in the Indies are found in its rivers, being probably washed down from the hills by torrents. Here are also mines of iron and tin, and leadstones. Birds nests † are to be had in this island, which are eatable, and reckoned a great delicacy. The beasts are, oxen, buffaloes, deer, goats, elephants, tigers, and monkeys. This island has five rivers, especially towards the west and south. In their monsoon from April to September, the wind is westerly; and they have continual heavy rains, attended with violent storms of thunder and lightning. The rainy season continues for eight months of the year, and as during that time all the flat country near the coast is overflowed, the air is rendered very unhealthy, and the inhabitants are forced to build their houses on floats, which they make fast to trees. The houses have but one floor, with partitions made with cane; and the roofs are covered with palmetto leaves, the eaves of which reach within four or five feet of the bottom. The west and north-east sides of the island are almost desert, and the east is but little known. The inland parts are very mountainous; and the south-

N. 30.

east, for many leagues together, is a stinking morass, which being overflowed in the wet season, is very unhealthy.

The Portuguese, who first discovered Borneo, had arrived in the Indies above 30 years before they knew any thing of it more than the name, and its situation, by reason of their frequently passing by its coast. At last one captain Edward Corril had ordered to examine it more narrowly; and being once acquainted with the worth of the country, they made frequent voyages thither. They found the coasts inhabited by Malayan Moors, who had certainly established themselves there by conquest; but the original inhabitants still remain in the mountains, and are styled *Beajus*, which in the Malayan language signifies a *wild man*. The most authentic account of these people is the following, which was extracted from the papers of father Antonio Ventimiglia, an Italian missionary. He was sent to Borneo from Macao, on board a Portuguese ship, converted great numbers to Christianity, and died on the island about the year 1691. The Beajus have no kings, but many little chiefs. Some are subject to the Moorish kings, and pay them tribute; but such as live far up the country, are altogether independent, and live according to their own customs. They are generally very superstitious, and much addicted to augury. They do not adore idols; but their sacrifices of sweet wood and perfumes are offered to one God, who, they believe, rewards the just in heaven, and punishes the wicked in hell. They marry but one wife; and look upon any breach of conjugal faith, either in the man or woman, as a capital offence. The Beajus are naturally honest and industrious, and have a brotherly affection for one another. They have a notion of property, which yet does not render them covetous. They sow and cultivate their lands; but in the time of harvest, each reaps as much as will serve his family, and the rest belongs to the tribe in common; by which means they prevent necessity or disputes. With the Moors on the coasts the Portuguese for some time carried on a considerable trade, and at their request settled a factory there; which, however, was afterwards surprised and plundered by the Moors, who put most of the people to the sword. The most considerable river in Borneo is called *Banjar*, at the mouth of which our East India company have a factory.

BORNHOLM, an island in the Baltic sea, to the south-east of the province of Schonen in Sweden. It is twenty-one miles in length, and above thirteen in breadth. It has three considerable towns, Rattum, Sandwick, and Nexia; with a great number of villages; and is fertile and populous. It was conquered by the Swedes in 1658; but the inhabitants, under the conduct of Jens Roefelds, voluntarily surrendered it to the king of Denmark, on account of the bad usage they received from the former. In 1678, a body of 5000 Swedish troops, in their passage from Pomerania to Sweden, being shipwrecked on this island, such of them as remained were made prisoners of war. The inhabitants defend the island by their own militia, without any expence to the crown. The commandant or governor resides at Rattum. E. Long. 14. 56. N. Lat. 55. 15.

BORNOU, a kingdom or province of Zaara in Africa, extending from 12 to 22. degrees of east longitude

Borneo
||
Bornou.

† See Bir-
2-
N^o 6.

itude, and from 17 to 21 degrees of north latitude. The northern part is poor, and like the rest of the provinces of Zaara; but all the rest is well watered by springs and rivers that tumble down with a dreadful noise from the mountains; rendering the country prolific in corn, grass, and fruits, and giving it a pleasing aspect. The eastern and western frontiers are divided into mountains and valleys, the latter being all covered with flocks of cattle, fields of rice and millet, and many of the mountains with wood, fruit-trees, and cotton. On the north-west stands the mountain of Faïton, having plenty of good iron mines; and on the south flows the river Niger, which, it is said, after running a great many leagues under a long chain of mountains, rears up its head again, and mingles its streams with the waters of the lake Bornou in its course, from whence it washes the walls of the capital of this kingdom. The compilers of the Universal History, however, are of opinion, that in these mountains the river Niger hath its source, because no river hath been traced to the eastward, except the Nile, which runs in a different course from north to south, and the White river, on the western frontiers of Abyssinia, which is a branch of the Nile. The eastern and western parts of Bornou are inhabited by a people of a roving disposition, who live in tents, and have their women, children, and every thing else, in common; the word *property*, or any idea equivalent to it, being utterly unknown among them. They have neither religion, laws, government, nor any degree of subordination; and hence they have been supposed by Cluverius to be the lineal descendants of the ancient Garamantes, and this to have been the residence of that people. In these parts, the natives are almost to a man shepherds and husbandmen. In summer they go naked, except a short apron before; but in winter they are warmly clothed with the softest sheepskins, of which they also form their bed-clothes; and indeed this is scarce a sufficient defence against the inclemency of the weather at certain seasons of the year, when a cold piercing wind blows from the northern mountains that chills the blood in proportion as the pores of the body have been opened by the scorching heats of summer. Baudrand and Daper affirm, that the natives are scarce superior in their understanding to brutes; not even having any names wherby to distinguish each other, except what they take from some personal defect or singularity; such as lean, fat, squinting, hump-backed, &c. In the towns, however, it is acknowledged that they are something more civilized and polite, being many of them merchants; but of these towns, or indeed of the kingdom in general, very little is known.

BOROMÆUS. See BOROMÆUS.

BORONDON, (S.), an island in the Atlantic Ocean, mentioned by some writers, particularly Linshotten, in their description of the Canary islands, as something supernatural. It is said to be about 100 leagues distant from Ferro, probably well, though no writer has pretended to lay down its exact situation. There it is affirmed several ships have touched by accident, and all agree in their relations of the state of the inhabitants and island. They affirm, that it is perpetually clothed with a great variety of wood, chiefly fruit-trees: that the valleys are in a perpetual state of verdure; and continually decked with flowers, grass, and plants, the

spontaneous productions of the earth; or with corn and B rough. pulic, cultivated with great care by the inhabitants: that the soil is so prolific as to raise large quantities of corn for exportation; and that the ships that call here never fail of meeting with refreshments of every kind. It is said to be peopled by Christians, who have a language of their own, apparently combined of a variety of modern languages; for, say they, whoever understands the European tongues may make shift to hold conversation with this people. It is remarkable, that no ships, expressly sent upon this discovery, were ever fortunate enough to fall in with the island of St Borondon, though the Spaniards have several times attempted it from the Canaries. Hence it has been called the *marvellous island*; and hence indeed we may conclude, either that it exists wholly in imagination, or at least that it is surrounded with such currents as insensibly carry ships out of their course, and prevent their meeting with it. Some writers affirm that it actually disappears upon certain occasions, and shifts its position; while others, with more appearance of truth, allege, that it is frequently overcast with thick and impenetrable clouds, which occasion the disappointment of all the adventurers who have gone in search of it.

BOROUGH, BURROUGH, *Borow*, or *Burgh*, is frequently used for a town or corporation which is not a city.

BOROUGH, in its original Saxon *berge*, or *burgh*, is by some supposed to have been primarily meant of a titling or company consisting of ten families, who were bound and combined together as each others pledge. Afterwards, as Verilegan informs us, borough came to signify a town that had something of a wall or inclosure about it; so that all places which among our ancestors had the denomination borough, were one way or other fenced or fortified. But, in later times, the same appellation was also bestowed on several of the *ville insigniores*, or country towns of more than ordinary note, though not walled.

The ancient Saxons, according to Spelman, gave the name burgh to those called, in other countries, cities. But divers canons being made for removing the episcopal sees from villages and small towns to the chief cities, the name *city* became attributed to episcopal towns, and that of borough retained to all the rest; though these too had the appearance of cities, as being governed by their mayors, and having laws of their own making, and sending representatives to parliament, and being fortified with a wall and castle, and the like.

BOROUGH, or *burgh*, is now particularly appropriated to such towns and villages as send burgesses or representatives to parliament. Boroughs are equally such, whether they be incorporate or not; there being great numbers of our English boroughs not incorporated; and, on the contrary, several corporations that are not boroughs; *e. gr.* Kingston, Deal, Kendal, &c.

BOROUGHS, in Scotland. See LAW, N^o clviii. 11.

Royal Boroughs, in Scotland, are corporations made for the advantage of trade, by charters granted by several of their kings; having the privilege of sending commissioners to represent them in parliament, besides other peculiar privileges. The Royal Boroughs are not only so many distinct corporations, but do also constitute one entire body, governed by, and accountable to, one general court, anciently called *the court of*

Borough *four boroughs*, held yearly to treat and determine concerning matters relating to the common advantage of all boroughs. The four boroughs which composed this court were, Edinburgh, Stirling, Roxburgh, and Berwick; which two last falling into the hands of the English, Linlithgow and Lanerk were put in their places; with a saving to the former, whenever they should return to their allegiance. But this court not being sufficient to answer the necessities of the royal boroughs, they were all empowered, under James III. in 1487, to send commissioners to a yearly convention of their own, which was then appointed to be held at Inverkeithing, but is now held at Edinburgh, under the denomination of the *convention of boroughs*, vested with great power, and having for their object the benefit of trade, and the general interest of the boroughs.

Borough-Courts, are certain courts held in boroughs, by prescription, charter, or act of parliament: such are the sheriff's court, and court of huldings, in London.

Borough-English, a customary descent of lands or tenements, in some ancient boroughs and copy-hold manors, by which the youngest son, and not the eldest, succeeds to the burgage tenement on the death of his father. For which Littleton gives this reason; because the younger son, by reason of his tender age, is not so capable as the rest of his brethren to help himself. Other authors have indeed given a much stronger reason for this custom; as if the lord of the fee had anciently a right to break the seventh commandment with his tenant's wife on her wedding night; and that therefore the tenement descended, not to the eldest, but to the youngest son, who was more certainly the offspring of the tenant. But it cannot be proved that this custom ever prevailed in England, though it certainly did in Scotland, (under the name of *marcheta*, or *marcheta*), till abolished by Malcolm III. But perhaps a more rational account than either may be brought from the practice of the Tartars; among whom, according to Father Duhalde, this custom of descent to the youngest son also prevails. That nation is composed totally of shepherds and herdsmen; and the elder sons, as soon as they are capable of leading a pastoral life, migrate from their father with a certain allotment of cattle, and go to seek a new habitation. The youngest son, therefore, who continues latest with his father, is naturally the heir of his house, the rest being already provided for. And thus we find, that among many other northern nations it was the custom for all the sons but one to migrate from the father, which one became his heir. So that possibly this custom, wherever it prevails, may be the remnant of that pastoral state of the ancient Britons and Germans which Cæsar and Tacitus describe.

Borough-head, or *Head-borough*, called also *burghholder*, or *burghholder*, the chief man of the decenna, or hundred, chosen to speak and act in behalf of the rest.

Head-borough also signifies a kind of head constable, where there are several chosen as his assistants, to serve warrants, &c. See **CONSTABLE**.

BOROUGHBRIDGE, a town in the north riding of Yorkshire in England, seated on the river Your, over which there is a handsome stone bridge. The town is not large, but commodious, and sends two members to parliament. W. Long. 1. 15. N. Lat. 54. 10.

BOROZAIL, or the zeal of the Ethiopians, a dis-

ease epidemic in the countries about the river Senega. **Borrachio** It principally affects the pudenda, but is different from the lues venerea. It owes its rise to excessive venery; **Borrachio** in the men this distemper is called *afab*, and in women *affhotus*.

BORRACHIO. See **CAUCHOUK**.

BORRAGE. See **ANCHUSA**.

BORRELLISTS, in church-history, a Christian sect in Holland; so denominated from their founder Borrel, a person of great learning in the Hebrew, Greek, and Latin tongues. They reject the use of the sacraments, public prayer, and all other external acts of worship. They assert, that all the Christian churches of the world have degenerated from the pure apostolical doctrines, because they have suffered the word of God, which is infallible, to be expounded, or rather corrupted, by doctors who are not infallible. They lead a very austere life, and employ a great part of their goods in alms.

BORRICHIOUS, one of the most learned men of his age, the son of a Lutheran minister in Denmark, was born in 1626. He applied himself to physic in the university of Copenhagen, and began to practise during a most terrible plague that made great havoc in that city. He travelled: but before his departure, in 1660, he was appointed professor in poetry, botany, and chemistry; and at his return discharged his duties with great assiduity, of which the works he published afford full proof. He was raised to the office of counsellor in the supreme council of justice, in 1686; to that of counsellor of the Royal Chancery, in 1689; and died of the operation for the stone, in 1690. He published, 1. *Lingua pharmacopæorum*. 2. *Dissertationes de præticis Græcis et Latinis*. 3. *De ortu et progressu chemiæ*; and several other works.

BORROMEUS (St Charles), cardinal, and archbishop of Milan; a personage of great note in the Romish calendar, and whose sincere piety, simplicity of manners, and zeal for reformation, render him indeed a character equally interesting and instructive to the members of any church. He was the son of Gilbert Borromeus Count of Arona and of Mary of Medicis, and was born at the castle of Arona upon Lake Major in the Milanese in October 1538. When he was about 12 years old, Julius Cæsar Borromeus resigned an abbacy to him of a considerable revenue, which was considered as an hereditary inheritance of the family; which Charles accepted, but applied the revenue wholly in charity to the poor. Having acquired a sufficient knowledge of the languages at Milan, he studied the civil and canon law at Pavia, where he lived like another Lot in Sodom, preserving his innocence among a thousand snares by which it was endangered. He received great advantage from the company and conversation of Francis Alciat, one of the most learned men of the age, for whom he afterwards procured the purple. He would accept no new benefice but upon condition that he should be at liberty to apply the revenue to public uses. In the year 1554, Charles being then 16 years old, his father died, an event which brought him back to the castle of Arona; where, though he had an elder brother, Count Frederick, he was requested by the family to take upon him the management of the domestic affairs, to which at length he consented.

After

Borromeus. After some time he returned again to his studies, which, in the year 1559, being then just 21, he finished by a solemn act, and took his doctor's degree. The promotion of his uncle to the pontificate, by the name of *Pius IV.* which happened the year following, seemed to have very little effect upon him; but he was very soon made protonotary, and intrusted both with the public and privy seal of the ecclesiastical state: he was also, at the same time, created cardinal deacon, and soon after archbishop of Milan. In obedience to the will of his uncle the pope, he lived in great splendor, having a brilliant retinue and a great number of domestics; yet his own temperance and humility were never brought into question. In order to render even his amusements useful, he established an academy of select and learned persons, as well ecclesiastics as laics, from among his household and dependants, who were employed in some exercise which tended to inspire a love of virtue, and to form a just taste. Each of them was to write upon some chosen subject, either in verse or in prose, and to communicate to each other in frequent conferences the fruits of their studies. The works produced by this society have been published in many volumes, under the title of *Actus Vaticanæ*, because these useful assemblies were held at the Vatican, and at night, after the business of the day was over. About this time Charles also formed a design of founding a college at Pavia, which should at the same time be a school of science and an asylum from the vices and vanities of the world. In prosecution of this design, he raised a large edifice upon the foundations of several houses which belonged to the family of Borromeus in that city; he obtained from the pope several benefices, which he attached to his building; he provided it with all things necessary for the young scholars out of his own revenue; and he dedicated his college to St. Justina virgin and martyr.

Upon the death of his only brother Frederick, his relations, his friends, and even the pope himself, advised him to change his state, to quit the church, and marry, that his family might not become extinct. Charles, however, contrary to this advice and the expectations of the world, received the priesthood, and addressed the pope in these terms: "Do not complain of me, Holy Father, for I have taken a spouse whom I love and on whom my wishes have been long fixed." From this time he became more fervent in exercises of piety and ecclesiastical knowledge: He perceived that some literati who had departed from the faith had also corrupted the writings of some holy doctors of the church, and he thought he should render religion good service if he could restore the genuine reading: He therefore employed Achilles Statius, a Portuguese of great learning, in this work, whom for that purpose he retained at Rome. To his zeal and attention also is owing the congregation of eight cardinals, still subsisting, to resolve doubts and obviate difficulties which should arise in explanations of the council of Trent.

There was a very intimate friendship between Borromeus and Don Bartholemey des Martyris archbishop of Prague, and author of a work intitled *Stimulus Pasterum*. This work falling into Borromeus's hands gave him an earnest desire to become a preacher, as he was now convinced that preaching was one of the principal duties of a prelate. An almost inconceivable

multiplicity of business, ill health, a feeble voice, and a difficult pronounciation, were no inconsiderable obstacles to his design, yet he surmounted them all; and though his beginnings were weak, yet perseverance crowned them with success.

Having obtained permission to visit his church, which the pope had hitherto refused as he found his presence necessary at Rome, he prepared to set out for Milan. He had before sent thither his grand vicar Ormanetus, whose labours at first had not been unsuccessful, but who soon found oppositions so pertinacious and obdurate as put an end to his hopes: Borromeus therefore saw the necessity of going in person, and he was received with the most distinguished honours. He was, however, soon recalled to Rome, where many things made his presence necessary: the pope was gradually dying; and Charles arrived just time enough to administer to him the last sacraments.

Pius IV. died on the 7th of January 1566, and 28 days afterwards Cardinal Alexandrine mounted the papal chair, and assumed the name of *Pius V.* the skill and diligence of Borromeus having contributed not a little to prevent the cabals of the conclave.

As soon as this event had taken place, and all was quiet at Rome, Borromeus gave himself wholly up to the reformation of his diocese, where the most flagitious irregularities were openly practised, having first made another reform in his own family. He began by making pastoral visits in his metropolis, where the canons were not distinguished for the purity of their manners. He soon restored proper decency and dignity to divine service, by a variety of wise and necessary regulations: In conformity to the decrees of the council of Trent, he cleared the cathedral of many pompous tombs, rich ornaments, banners, arms, and in general of all the trophies with which the vanity of man had disfigured the house of God; and in order to give a sanction to his zeal by his example, he spared not the monuments of his nearest relations. Nor did his zeal stop here: he divided the nave of the church through its whole length into two parts, by strong thick planks, that the two sexes, being separated, might perform their devotions without any attention to each other, and with a modesty and recollection more suitable to the place.

This pastoral care extended from the cathedral to the collegiate churches, and even to the fraternities or societies of penitents, particularly that of St. John the Baptist. The duty of this society was to attend criminals to the place of punishment, to assist, comfort, and prepare them for death; but the spirit of the institution was now forgotten, and the wretches who were condemned to death were commonly dragged to execution like beasts, without any spiritual assistance or consolation. But the archbishop revived the original fervor of this order, in the exercise of their peculiar duty, and persuaded many of the nobility and principal persons of the city to become members of a society appropriated to so eminent a branch of Christian charity. The reformation of the monasteries followed that of the churches, and the vigilance of the pastor soon extended itself from the city to the country round it, which abounded with irregularities that required his correction. The great abuses and irregularities which had over-run the church at this time arose prin-

Borromeus. cipally from the gross ignorance of the clergy; in order therefore to attack these evils at their root, Charles established seminaries, colleges, and communities, for the education of young persons intended for holy orders. He met with many difficulties, and much opposition in his endeavours to bring about a reformation of manners; but he prevailed against every obstacle by an inflexible constancy, tempered with great sweetness of manners.

The governor of the province, and many of the senators, were apprehensive that the cardinal's ordinances and proceedings would encroach upon the civil jurisdiction, and become inconsistent with the rights of his catholic majesty, to whom the duchy of Milan was then in subjection. And this was a fruitful source of remonstrances, representations, and complaints, which long troubled the courts of Rome and Madrid, and which the king of Spain, Philip II. referred entirely to the decision of the pope. But *Borromeus* had a more formidable opposition to struggle with, that of several religious orders, particularly the Brothers of Humility. Three provots of this society entered into a conspiracy to cut him off; and one of their confederates, called *Jerom Donat*, whose surname was *Farina*, took upon him to carry the design into execution. For this purpose he mixed with the crowd that went into the archiepiscopal chapel, where the cardinal spent an hour every evening in prayer with his domestics and other pious persons; and having watched his opportunity, he fired an arquebus at him, which was loaded with a ball suited to the bore of the piece, and with a considerable charge of leaden shot. It is said that the ball struck him on the spinal bone, but fell down at his feet without doing any other damage than soiling his rochet, and that one of the shot penetrated his clothes to the skin, and there stopped, without imprinting any wound, which was considered as a miracle, especially as the other shot tore away part of a wall, and went quite through a table.

In the year 1576, the city and diocese of Milan were visited by the plague, which swept away incredible numbers; and the behaviour of *Borromeus*, on this occasion, was truly christian and heroic: He not only continued on the spot, but he went about giving directions for accommodating the sick, and burying the dead, with a zeal and attention that were at once ardent and deliberate, minute and comprehensive; and his example stimulated others to join in the good work. He avoided no danger, and he spared no expence; nor did he content himself with establishing proper regulations in the city, but went out into all the neighbouring parishes where the contagion raged, distributing money to the poor, ordering proper accommodations for the sick, and punishing those, especially the clergy, who were remiss in the duties of their calling. Charles, notwithstanding the fatigue and perplexity which he suffered by thus executing his pastoral charge, abated nothing of the usual austerity of his life, nor omitted any of his stated devotions; for, whatever approached to luxury or magnificence, he considered as incompatible with the propriety of his character. It happened, that being once on a visit to the archbishop of Sienna at his palace, a very sumptuous entertainment was provided for him. *Borromeus*, though he had been used to content himself with bread and wa-

ter, yet sat down at the table, where however he eat but little, and gave sufficient intimation that he was much displeas'd with such ostentatious prodigality; but what was his surprize when he saw the table again covered with a desert, consisting of whatever was most rare, exquisite, and costly? He immediately rose hastily from his seat, as if he had suddenly recollected some pressing business, and gave orders for his departure, notwithstanding the rain, and the most earnest entreaties of the archbishop. "My Lord," said the cardinal, "if I should tarry here to-night, you would give me another such treat as that I have just seen, and the poor will then suffer another loss, great numbers of whom might have been fed with the superfluities that have been now set before us."

The continual labours and austerities of *Borromeus* naturally shortened his life; he went to Verca to put an end, if possible, to the divisions which threatened the most fatal consequences; and, when he was there, he received a message from the Duke of Savoy, requesting his presence at Turin. From Turin he retired to a place called the *Sepulchre*, on the mountain *Varais*, where he was seized with an intermittent fever, which scarce permitted him to return alive to Milan, where he arrived on the 31 of November 1584, and died the next day. He was lamented by the city and the whole province with such marks of sincere sorrow as are rarely seen; and he was immediately worshipped as a saint without waiting for the pope's approbation. The pope, however, when he was told of it by Cardinal *Baronius*, gave directions that the devotion of the people should not be restrained, though *Borromeus* was not canonized till the 1st of November 1610, in the pontificate of Leon XI. Since that time many churches and chapels have been erected in honour of this saint, and many religious societies instituted and put under his protection.

The foregoing particulars are extracted from an account of the life of *Borromeus*, written some years ago by Father *Anthony Touron*. Upon a comparison of this life with that written by *Ribadeneira* a Spanish Jesuit above a century ago, it appears that the improvement of knowledge has made a very striking difference in this kind of biography. *Ribadeneira*, who lived in the midst of ignorance and superstition, did not suspect that the time was at hand when the incredible and ridiculous fables he recites could not be believed: his life of this saint therefore abounds with particulars which *Touron* has justly omitted. We are told that a miraculous light was seen over the chamber of *Borromeus's* mother when she was in labour: That *Borromeus*, seeing two persons carried violently down a rapid river on their horses, and just ready to perish, caught their horses suddenly to leap with them out of the water, by giving them his benediction: That *Oclavian Varese*, a gentleman of Milan, who was confined to his bed by sickness, when *Borromeus* died became instantly well, by recommending himself to the Saint's intercession. That a daughter of *Julius Bonacina* was instantly cured of a disorder in her eye, which had taken away the sight of it, by performing an act of devotion in honour of this Saint: That a count of Ferrara was instantly seized with a violent disease upon speaking irreverently of *Borromeus's* picture, but was cured upon confessing his fault. It would certainly be

Borrowing a work of infinite service to the Romish church, to new-write the lives of her saints in such a manner as can now be believed, since the lives already written might by that means be gradually superseded, which are a better antidote against Popery than the arguments of the best reasoner in the world.

BORROWING AND HIRING, in law, are contracts by which a qualified property may be transferred to the hirer or borrower; in which there is only this difference, that hiring is always for a price or stipend, or additional recompense; borrowing is merely gratuitous. But the law in both cases is the same. They are both contracts, whereby the possession and transient property is transferred for a particular time or use, on condition and agreement to restore the goods so hired or borrowed, as soon as the time is expired, or the use performed, together with the price or stipend (in case of hiring) either expressly agreed upon by the parties, or left to be implied by law, according to the value of the service. By this mutual contract, the hirer or borrower gains a temporary property in the thing hired, accompanied with an implied condition to use it with moderation, and not to abuse it; and the owner or lender retains a reversionary interest in the same, and acquires a new property in the price or reward. Thus, if a man hires or borrows a house for a month, he has the possession and a qualified property therein during that period; on the expiration of which his qualified property determines, and the owner becomes (in case of hiring) intitled also to the premium or price for which the house was hired.

There is one species of this price or reward the most usual of any, but concerning which many good and learned men have in former times very much perplexed themselves and other people, by raising doubts about its legality *in foro conscientie*. That is, when money is lent on a contract to receive not only the principal sum again, but also an increase by way of compensation for the use, which is generally called *interest* by those who think it lawful, and *usury* by those who do not so. But as to this, see the article INTEREST.

BORROWSTOWNNESS. See BURROWSTOWNNESS.

BORSEHOLDER, among the Anglo-Saxons, one of the lowest magistrates, whose authority extended only over one freeburgh, tithing, or decenary, consisting of ten families. Every freeman who wished to enjoy the protection of the laws, and not to be treated as a vagabond, was under the necessity of being admitted a member of the tithing where he and his family resided; and in order to obtain this admission, it was as necessary for him to maintain a good reputation; because all the members of each tithing being mutual pledges and sureties for each other, and the whole tithing sureties to the king for the good behaviour of all its members, they were very cautious of admitting any into their society who were of bad or doubtful characters. Each tithing formed a little state or commonwealth within itself, and chose one of its most respectable members for its head, who was sometimes called the *alderman* of such a tithing or freeburgh, on account of his age and experience, but most commonly *borjelder*, from the Saxon words *borh*, "a surety," and *alder*, "a head or chief." This magistrate had authority to call together the members of his tithing, to preside in their meetings, and to put their sentences in execution. The members of

each tithing, with their tithing-man or *borjelder*, at their head, constituted a court of justice, in which all the little controversies arising within the tithing were determined. If any dispute of great difficulty or importance happened, or if either of the parties was not willing to submit to a sentence given in the tithing-court, the cause was referred or appealed to the next superior court, or court of the hundred.

BORSET, or **BORSETT**, celebrated for its baths, a place about half a league from Aix-la-Chapelle in Germany. The abbey here is a very magnificent pile of building. It was formerly a monastery; but serves for a nunnery, whose abbess is a princess of the empire, and lady of Bosfet. The waters are warm, and of the nature of those of Aix-la-Chapelle; but they are only used as baths for the diseases in which the waters last mentioned are recommended, and also in dropical and sceleratous cases. The waters are distinguished into the upper and lower springs. The former were found by Dr Simmons to raise the thermometer to 158°, the latter to only 127°. All the baths are supplied by the first. Dr Simmons observed that these waters were much less sulphureous than those of Aix-la-Chapelle, probably on account of their greater heat. He likewise found that they abounded much with selenites, which incurst the pipe through which the water passes, and likewise the sides of the bath.

BORYSCHENES. See BORISCHENES.

BOS (John Baptist du), a celebrated author and member of the French academy, was born at Beauvais in 1670, and finished his studies at the Sorbonne. In 1695, he was made one of the committee for foreign affairs under Mr Torez; and was afterwards charged with some important transactions in England, Germany, Holland, and Italy. At his return to Paris, he was handsomely preferred, made an abbé, and chosen perpetual secretary of the French academy. He was the author of several excellent works; the principal of which are, 1. Critical reflections upon poetry and painting, 3 vols 12mo. 2. The history of the four Gordians, confirmed and illustrated by medals. 3. A critical history of the establishment of the French monarchy among the Gauls, 2 vols 4to, 4 vols 12mo. He died at Paris on the 23d of March 1742.

Bos (Lewis Jaussen), an esteemed painter, was born at Bois-le-Duc. Having been carefully instructed in the art of painting by the artists of his native city, he applied himself entirely to study after nature, and rendered himself very eminent for the truth of his colouring and the neatness of his handling. His favourite subjects were flowers, and curious plants, which he usually represented as grouped, in glasses, or vases of crystal, half filled with water; and gave them so lovely a look of nature, that it seemed scarce possible to express them with greater truth or delicacy. It was frequent with this master to represent the drops of dew on the leaves of his subjects, which he executed with an uncommon transparency; and embellished his subjects with butterflies, bees, wasps, and other insects, which, Sandraut says, were superior to any thing of that kind performed by his contemporary artists. He likewise painted portraits with very great success; and showed as much merit in that style as he did in his competition of still life. He died in 1577.

BOS, in zoology, a genus of quadrupeds belonging to the order of peona. The characters of this genus

are taken from the horns and teeth. The horns are hollow within; and turned forward, in the form of crescents: There are eight fore-teeth in the under jaw, and none in the upper, their place being supplied by a hard membrane; and there are no dog-teeth in either jaw. Linnæus enumerates six species, viz.

I. The TAURUS, including the bull and cow, has cylindrical horns bent outwards, and loose dewlaps. The bull, or male, is naturally a fierce and terrible animal. When the cows are in season, he is perfectly ungovernable, and often altogether furious. When chafed, he has an air of fullen majesty, and oft tears up the ground with his feet and horns. The principal use of the bull is to propagate the species; although he might be trained to labour, his obedience cannot be depended on. A bull, like a stallion, should be the most handsome of his species. He should be large, well-made, and in good heart; he should have a black eye, a fierce aspect, but an open front; a short head; thick, short, and blackish horns, and long shaggy ears; a short and straight nose, large and full breast and shoulders, thick and fleshy neck, firm reins, a straight back, thick fleshy legs, and a long tail well covered with hair. Castration remarkably softens the nature of this animal; it destroys all his fire and impetuosity, and renders him mild and tractable, without diminishing his strength; on the contrary, after this operation, his weight is increased, and he becomes fitter for the purposes of plowing, &c.

The best time for castrating bulls is at the age of puberty, or when they are 18 months or two years old; when performed sooner, they often die. However, it is not uncommon to castrate calves a few days after birth. But such as survive an operation so dangerous to their tender age, generally grow larger and fatter, and have more courage and activity than those who are castrated at the age of puberty. When the operation is delayed till the age of six, seven, or eight years, they lose but few of the qualities of bulls; are much more furious and untractable than other oxen; and when the cows are in season, they go in quest of them with their usual ardour.

The females of all these species of animals which we keep in flocks, and whose increase is the principal object, are much more useful than the males. The cow produces milk, butter, cheese, &c. which are principal articles in our food, and besides answer many useful purposes in various arts. Cows are generally in season, and receive the bull, from the beginning of May to the middle of July. Their time of gestation is nine months, which naturally brings the veal or calves to our markets from the beginning of January to the end of April. However, luxury has fallen upon methods of interrupting this natural course, and veal may be had almost every month in the year. Cows, when improperly managed, are very subject to abortion. In the time of gestation, therefore, they ought to be observed with more than ordinary care, lest they should leap ditches, &c. Neither should they be suffered to draw in the plough or other carriage, which is a practice in some countries. They should be put into the best pasture, and should not be milked for six weeks or two months before they bring forth their young. The calf should be allowed to suck and follow its mother during the first six or eight days. After this it

begins to eat pretty well, and two or three sucks in a day will be sufficient. But if the object be to have it quickly fattened for the market, a few raw eggs every day, with boiled milk, and a little bread, will make it excellent veal in four or five weeks. This management of calves applies only to such as are designed for the butcher. When they are intended to be nourished and brought up, they ought to have at least two months suck; because the longer they suck, they grow the stronger and larger. Those that are brought forth in April, May, or June, are the most proper for this purpose; when calved later in the season, they do not acquire sufficient strength to support them during the winter. The cow comes to the age of puberty in 18 months, but the bull requires two years: but although they are capable of propagating at these ages, it is better to restrain them till they be full three years. From three to nine years those animals are in full vigour; but when older, they are fit for nothing but to be fed for the butcher. A milk-cow ought to be chosen young, fleshy, and with a brisk eye.

The heaviest and most bulky animals neither sleep so profoundly, nor so long, as the smaller ones. The sleep of the ox is short and slight; he wakes at the least noise. He lies generally on the left side, and the kidney of that side is always larger than the other. There is great variety in the colour of oxen. A reddish or black colour is most esteemed. The hair should be glossy, thick, and soft; for when otherwise, the animal is either not in health, or has a weakly constitution. The best time for maring them to labour is at the age of two and a half or three years. The ox eats very quick, and soon fills his first stomach; after which he lies down to ruminate or chew the cud. The first and second stomachs are continuations of the same bag, and very capacious. After the grass has been chewed over again, it is reduced to a kind of mash, not unlike boiled spinach; and under this form it is sent down to the third stomach, where it remains and digests for some time; but the digestion is not fully completed till it comes to the fourth stomach, from which it is thrown down to the guts. The contents of the first and second stomachs are a collection of grass and other vegetables roughly macerated; a fermentation, however, soon commences, which makes the grass swell. The communication between the second and third stomach is by an opening much smaller than the gullet, and not sufficient for the passage of the food in this state. Whenever then the two first stomachs are distended with food, they begin to contract, or rather perform a kind of reaction. This reaction compresses the food, and makes it endeavour to get out: now the gullet being larger than the passage between the second and third stomachs, the pressure of the stomach necessarily forces it up the gullet. The action of ruminating, however, appears to be in a great measure voluntary; as animals of this kind have a power of increasing the reaction of their stomachs. After the food undergoes a second mastication, it is then reduced into a thin pulp, which easily passes from the second to the third stomach, where it is still further macerated; from thence it passes to the fourth, where it is reduced to a perfect mucilage, every way prepared for being taken up by the lacteals, and converted into nourishment. What confirms this account of chewing the cud is, that

that as long as these animals suck or feed upon liquid aliment, they never ruminate; and in the winter, when they are obliged to feed upon hay and other dry victuals, they ruminate more than when they feed upon fresh grass.

Bulls, cows, and oxen, are fond of licking themselves, especially when lying at rest. But this practice should be prevented as much as possible; for as the hair is an undigestible substance, it lies in the stomach or guts, and is gradually coated by a glutinous substance, which in time hardens into round stones of a considerable bulk, which sometimes kills them, but always prevents their fattening, as the stomach is rendered incapable of digesting the food so well as it ought.

The age of these animals may be distinguished by the teeth and horns. The first fore-teeth fall out at the age of six months, and are succeeded by others of a darker colour, and broader. At the end of sixteen months, the next milk-teeth likewise fall out; and at the beginning of the fourth year all the fore-teeth are renewed, and then they are long, pretty white, and equal: However, as the animal advances in years, they become unequal and blackish. The horns of oxen four years of age are small pointed, neat, and smooth, but thickest near the head: This thick part next season is pushed further from the head by a horny cylinder, which is also terminated by another swelling part, and so on (for as long as the ox lives, the horns continue to grow); and these swellings become so many annular knots by which the age may easily be reckoned: But from the point to the first knot must be counted three years, and every succeeding knot only one year. The bull, cow, and ox, generally live about fourteen or fifteen years.

Ox-beef is very nourishing, and yields a strong aliment; the flesh of a cow, when well fatted and young, is not much inferior. Bull-beef is hard, tough, and dry; for which reason it is not much used for food. Veal is well tasted, easy of digestion, and rather keeps the body open than otherwise.

The northern countries of Europe produce the best cattle of this kind. In general, they bear cold better than heat; for this reason they are not so plenty in the southern countries. There are but few in Asia the south of Armenia, or in Africa beyond Egypt and Barbary. America produced none till they were carried there by the Europeans. But the largest are to be met with in Denmark, Podolia, the Ukrain, and among the Calmuck Tartars; likewise those of Ireland, England, Holland, and Hungary, are much larger than those of Persia, Turkey, Greece, Italy, and Spain; but those of Barbary are least of all. In all mountainous countries, as Wales, the Highlands of Scotland, &c. the black cattle are small; but hardy, and when fattened make excellent beef. In Lapland, they are mostly white, and many of them want horns.

The British breed of cattle, Mr Pennant observes, has in general been so much improved by foreign mixture, that it is difficult to point out the original kind of these islands. Those which may be supposed to have been originally British are far inferior in size to those on the northern part of the European continent: the cattle of the Highlands of Scotland are exceedingly small; and many of them, males as well as females, are hornless: the Welsh runts are much larger: the black

cattle of Cornwall are of the same size with the last. The large species that is now cultivated through most parts of Great Britain, are either entirely of foreign extraction, or our own improved by a cross with the foreign kind. The Lincolnshire kind derive their size from the Holstein breed; and the large hornless cattle that are bred in some parts of England, come originally from Poland.

About 250 years ago, there was found in Scotland a wild race of cattle, which were of a pure white colour, and had, if we may believe Boethius, manes like lions. Mr Pennant says, he cannot but give credit to the relation; having seen in the woods of Drunkanrig in North Britain, and in the park belonging to Chillingham castle in Northumberland, herds of cattle probably derived from the savage breed. They had long their manes, but retained their colour and fierceness; they were of a middle size, long legged, and had black muzzles and ears; their horns fine, and with a bold and elegant bend.—The keeper of those at Chillingham said, that the weight of the ox was 38 stones; of the cow, 28: that their hides were more esteemed by the tanners than those of the tame; and they would give sixpence per stone more for them. These cattle were wild as any deer; on being approached, they would instantly take to flight, and gallop away at full speed; never mix with the tame species; nor come near the house, unless constrained to it by hunger in very severe weather. When it is necessary to kill any, they are always shot: if the keeper only wounds the beast, he must take care to keep behind some tree, or his life would be in danger from the furious attacks of the animal, which will never desist till a period is put to its life.

Frequent mention is made of our savage cattle by historians. One relates, that Robert Bruce was (in chasing these animals) preserved from the rage of a wild bull by the intrepidity of one of his courtiers, from which he and his lineage acquired the name of *Turn-bull*. Fitz-Stephen names these animals (*ursi felines*) among those that harboured in the great forest that in his time lay adjacent to London. Another enumerates, among the provisions at the great feast of Nevil archbishop of York, six wild bulls; and Sibbald assures us, that in his days a wild and white species was found in the mountains of Scotland, but agreeing in form with the common sort. These were probably the same with the *bifontes jabati* of Pliny found then in Germany, and might have been common to the continent and our island; the loss of their savage vigour by confinement might occasion some change in the external appearance, as is frequent with wild animals deprived of liberty; and to that we may ascribe their loss of mane. The urus of the Hercynian forest described by Cæsar (lib. vi.) was of this kind; the same which is called by the modern Germans, *aurochs*, i. e. *ursi felines*.

The ox is the only horned animal in these islands that will apply his strength to the service of mankind. It is now generally allowed, that, in the draught, oxen are in many cases more profitable than horses; their food, harness, and shoes, being cheaper; and should they be hmed or grow old, an old working beast will be as good meat, and fatten as well, as a young one.

There is scarce any part of this animal without its

Bos.

History of London preserved in Leard's Ann. VIII.

use. The blood, fat, marrow, hide, hair, horns, hoofs, milk, cream, butter, cheese, whey, urine, liver, gall, spleen, bones, and dung, have each their particular use in manufactures, commerce, and medicine.

The skin has been of great use in all ages. The ancient Britons, before they knew a better method, built their boats with skins, and covered them with the hides of bulls, which served them for short coasting voyages.

*Prætor cara salix madefacta vimine parvum
Tæxitur in puppim, exque induta jumento,
Icthoris patiens, tænidiam super ducit annem:
Sic Venetus flagrans Pado, jusque Britannus
Navigat oceanum.* *LUCAS. lib. iv. 131.*

The bending willow into barks they twine;
Then line the work with spoils of slaughter'd kine.
Such are the floats Venetian fishers know,
When in dull marshes stands the settling Po;
On such to neighbouring Gaul, allur'd by gain,
The bolder Britons cross the swelling main.

Rowe.

Vessels of this kind are still in use on the Irish lakes; and on the Dee and Severn: In Ireland they are called *curachs*: in English, *coracles*: from the British *curragh*, a word signifying a boat of that structure. At present the hide, when tanned and curried, serves for boots, shoes, and numberless other conveniences of life.—Vellum is made of the thinnest calve-skins, and the skins of abortions. Of the horns are made combs, boxes, handles for knives, and drinking vessels; and when softened by water, obeying the manufacturer's hands, they form pellucid laminae for the sides of lanterns. These last conveniences were invented by the great king Alfred, who first used them to preserve his candle time-measurers from the wind; or (as other writers will have it) the tapers that were set up before the reliques in the miserable tattered churches of that time. The very smallest fragments, and even the dust and filings, of horn, are found very serviceable in mending cold lands. The matter lying within, on which the horn is formed, is called the *slough*; and, when dry, is used in making walls or fences, in which, covered from wet, it will last a long time. It is also most admirable in mending roads, where the soil is soft and spewy; for, dissolving, it becomes a glutinous substance, that binds amazingly with gravel. As a manure, they allow between two and three quarter-sacks to an acre. Horn saw-dust with mould is an excellent compost for flowers. It is also of use in hardening, and giving what is called a proper temper, to metals. In medicine, horns were employed as alexipharmics or antidotes against poison, the plague, or the small-pox; they have been dignified with the title of *English lazarus*, and are said to have been found to answer the end of the oriental kind.

The teguments, cartilages, and gristles, for the indifferent,—and, for the finer, all the cuttings, parings, and scrapes of hides,—are boiled in water, till the gelatinous parts of them are thoroughly dissolved; and the mats, properly dried, becomes glue. See *GLUE*.

The bones are used by mechanics where ivory is too expensive; by which the common people are served with many neat conveniences at an easy rate. From the tibia and carpus bones is procured an oil much used by coach-makers and others in dressing and clean-

ing harness, and all trappings belonging to a coach; and the bones calcined afford a fit matter for tests for the use of the refiner in the smelting trade. The blood is used as an excellent manure for fruit-trees, and is the basis of that fine colour the Prussian blue. The finews are prepared so as to become a kind of thread or small cord, used in sewing saddles, in making racquets, and other things of a like nature. The hair hath also its value, and is employed in many different ways. The long hair of the tail is frequently mixed with horse-hair spun into ropes, and sometimes wove. The short hair serves to stuff saddles, seats of several kinds, mattresses, and chairs. The refuse is a good manure, and operates more speedily than the horns. The fat, tallow, and suet, furnish us with light; and are also used to precipitate the salt that is drawn from briny springs. The gall, liver, spleen, and urine, had also their place in the materia medica, though they have now resigned it to more efficacious and agreeable medicines. The uses of butter, cheese, cream, and milk, in domestic œconomy, and the excellence of the latter in furnishing a palatable nutriment for most people whose organs of digestion are weakened, are too obvious to be insisted on.

II. The *BOVASUS* has a long mane; its horns are bent round towards the cheek, and are not above a span long. It is about the size of a large bull, and is a native of Africa and Asia. When enraged, he throws out his dung upon dogs or other animals that annoy him; the dung has a kind of caustic quality, which burns the hair off any animal it falls upon.

III. The *BISON* has short black rounded horns, with a great interval between their bases. On the shoulders is a vast hunch, consisting of a fleshy substance, much elevated. The fore-parts of the body are thick and strong; the hind-part, slender and weak. The hunch and head are covered with a very long undulated fleece, divided into locks, of a dull rust-colour: this is at times so long, as to make the fore-part of the animal of a shapeless appearance, and to obscure its sense of seeing. During winter, the whole body is clothed in the same manner. In summer the hind part of the body is naked, wrinkled, and dusky. The tail is about a foot long; at the end is a tuft of black hairs, the rest naked. It inhabits Mexico and the interior parts of North America. It is found in great herds in the Savannas; and is fond of marshy places, where it lodges amidst the high reeds. In Louisiana they are seen feeding in herds innumerable, promiscuously with multitudes of stags and deer, during morning and evening; retiring in the sultry heats into the shade of tall reeds, which border the rivers of America. They are exceedingly shy; and very fearful of man, unless they are wounded, when they pursue their enemy, and become very dangerous.

The chase of these animals is a favourite diversion of the Indians; and is effected in two ways. First, by shooting: when the marksman must take great care to go against the wind; for their smell is so exquisite, that the moment they get scent of him they instantly retire with the utmost precipitation. He aims at their shoulders, that they may drop at once, and not be irritated by an ineffectual wound. Provided the wind does not favour the beasts, they may be approached very near, being blinded by the hair which

Fig. 1. BOS 3 b.
The Cape Ox.

Fig. 2. BOS 3 a.
Muske Bull or Cow.

which covers their eyes.—The other method is performed by a great number of men, who divide and form a vast square: each band sets fire to the dry grass of the savannah where the herds are feeding: these animals having a great dread of fire which they see approach on all sides, they retire from it to the centre of the square; when the bands close and kill them (packed together in heaps) without the least hazard. It is pretended, that on every expedition of this nature they kill 1500 or 2000 beeves. The hunting-grounds are prescribed with great form, but the different bands should meet and interfere in the division. Penalties are enacted on such who infringe the regulations, as well as on those who quit their posts and suffer the beasts to escape from the hollow squares; the punishments are, the stripping the delinquents, the taking away their arms (which is the greatest disgrace a savage can undergo), or lastly the demolition of their cabins.

The uses of these animals are various. Powder-flasks are made of their horns. The skins are very valuable; in old times the Indians made of them the best targets. When dressed, they form an excellent buff; the Indians dress them with the hair on, and clothe themselves with them; the Europeans of Louisiana use them for blankets, and find them light, warm, and soft. The flesh is a considerable article of food, and the bunch on the back is esteemed a very great delicacy. The bulls become excessively fat, and yield great quantities of tallow. 150 pounds weight having been got from a single beast, which forms a considerable matter of commerce. These over-fed animals usually become the prey of wolves; for, by reason of their great unwieldiness, they cannot keep up with the herd. The Indians, by a very bad policy, prefer the flesh of the cows; which in time will destroy the species: they complain of the rankness of that of the bulls; but Du Pratz thinks the fat much more tender, and that the rankness might be prevented by cutting off the testicles as soon as the head is killed. The hair or wool is spun into cloth, gloves, stockings, and garters, which are very strong, and look as well as those made of the best sheep's wool: Governor Pennell assures us, that the most luxurious fabric might be made of it. The fleece of one of these animals has been found to weigh eight pounds.

Their sagacity in defending themselves against the attacks of wolves is admirable. When they scent the approach of a drove of those ravenous creatures, the head sings itself into the form of a circle: the weakest keep in the middle; the strongest are ranged on the outside, presenting to the enemy an impenetrable front of horns: should they be taken by surprise, and have recourse to flight, numbers of the fattest or the weakest are sure to perish. Attempts have been made to tame and domesticate the wild, by catching the calves and bringing them up with the common kind, in hopes of improving the breed; but it has not yet been found to answer: notwithstanding they had the appearance for a time of having lost their savage nature, yet they always grew impatient of restraint, and by reason of their great strength would break down the strongest inclosure, and entice the tame cattle into the corn-fields. They have been known to engender together, and to breed.

a. The *wild* of Hudson's Bay, a variety of this species, wants the hump between the shoulders. It is about the size of a Scotch bullock: has a sleek body, and short legs. The horns are large, and very remarkable: they are united at their origin in the middle, but immediately after, they fall down on each side of the crown of the head, then taper away till the point turning up. The hair is black, and grows to a great length; underneath which is a fine wool superior to Virginia wool. The male only has the curious shape; the female is covered with hair. These animals frequent the country about 100 miles inwards to the north-west of Churchill river in Hudson's Bay, where they are very numerous. They live in herds of 30, 40, and upwards to the number of 80 or 100. The bulls are very few in proportion to the cows: for, according to Mr Graham's information, it is rare to see more than two or three full-grown bulls with the largest herd; and from the number of males which at times are found dead, the Indians are of opinion that they kill each other in contending for the females at the rutting season. They are then so jealous of their mistresses, that they run at either man or beast who offers to approach them, and have been seen to run and bellow even at ravens and other huge birds which chanced to fly or light near them. They go to rut in August. The females bring forth their young about the latter end of May or beginning of June, and are never known to have more than one at a time. They delight most in the flattest and mountainous parts of the barren grounds, and are seldom found at any great distance through the woods. Though a beast of considerable magnitude and apparently unwieldy form, yet it climbs the rocks with great ease and agility; and is nearly as sure-footed as a goat, and like that animal will feed on any thing: for though they seem fondest of grass, yet in winter they eat moss and any other herbage they can find; also the tops of the willows and the barks of the pine-tree. The flesh of this animal no ways resembles that of the western buffalo; but is more like that of the moose or elk, the fat being of a clear white slightly tinged with a light azurine. The calves and young heifers are exceedingly good eating; but the flesh of the bulls both smell and taste so strong of musk, as to render it very disagreeable. It seems to have been from want of better information, that Mr Drage asserts the heart to be the most impregnated: had he said the kidneys, he would have been much nearer the truth. The urine must contain this scent in a very great degree: for the penis is always lubricated with a brown gummy substance, so highly scented with musk, that after having been kept for several years it does not seem to have lost any of its quality. The dung of this animal (though so large) is all in little round knobs; and so exactly like that of the varying hare both in size and colour, that it would be very easy to mistake the one for the other, were it not for the quantity. The Indians kill great numbers of them. From 2000 to 4000 weight of the flesh frozen is brought to Prince of Wales's Fort annually, and is served out as provisions to the Europeans. See the figures, Plate CL.

b. The *Cape Buffalo*, or Bos Caffee of Spanham, another variety, inhabits the interior parts of Africa north of the Cape of Good Hope, but does not extend to the north of the Tropic. They are said to be greatly superior

Bos.

in size to the largest English ox: hang their heads down, and have a most ferocious and malevolent appearance. They are in fact excessively fierce and dangerous to travellers; will lie quietly in wait in the woods, and rush suddenly on passengers, and trample them, their horses, and oxen of draught, under their feet: so that they are to be shunned as the most cruel beasts of this country. They will even return to the attack, and delight to lick the slaughtered bodies. They are prodigiously swift, and so strong, that a young one of three years of age, being placed with six tame oxen in a waggon, could not by their united force be moved from the spot. They are also found in the interior parts of Guinea; but are so fierce and dangerous, that the negroes who are in chase of other animals are fearful of shooting at them. The lion, which can break the back of the strongest domestic oxen at one blow, cannot kill this species, except by leaping on its back, and suffocating it by fixing its talons about its nose and mouth. The lion often perishes in the attempt; but leaves the marks of its fury about the mouth and nose of the beast. They live in great herds, especially in Krake-Kamma, and other deserts of the Cape; and retire during the day into the thick forests. They are reckoned good meat by the Dutch of the Cape. They are called *Aurochs*, but differ totally from the European. The warmth of the climate has prevented the vast length and abundance of hair which distinguishes the former, and the luxuriance of herbage in this country has given it the vast superiority of size.

Of this animal we have the following account by Dr Sparman, who was the first who gave a distinct delineation and description of it. Describing the death of one that was shot, he informs us, that "immediately after the report of the gun, the buffalo fell upon its knees: that he afterwards, however, raised himself up, and ran seven or eight hundred paces into a thicket; and directly upon this, with a most dreadful bellowing, gave us to understand that it was all over with him. All this together formed a spectacle, which most sportsmen would have been highly delighted to have been present at. This creature, as well as most of the larger kind of game, was shot by a Hottentot. Even some of the best huntsmen among the farmers are obliged, for the most part, to make use of Hottentots by way of bush-hunters; as in their skin cloaks they do not excite the attention of the wild beasts so much as the Europeans do in their dresses. They are likewise ready at any time when there is occasion for it, to go barefoot, and crawl softly upon their bellies, till they come within a proper distance of the animal. Moreover, when the buffalo at length is irritated, the Hottentots can much easier escape from the danger which threatens them than a Christian. I myself, on another occasion, saw two Hottentots run with amazing swiftness when a buffalo was in pursuit of them. It was not without the greatest discontent on the part of my Hottentots that I made a draught and took the dimensions of this buffalo; thus preventing them, in the mean while, from falling aboard of the flesh. Neither did they afterwards delay one moment to cut a few slices off and broil them. They likewise laid two bones on the fire to broil, for the sake of the marrow. After this they began to take out the entrails, which, according to the testimony of my

Bos.

Hottentots, perfectly resembled those of an ox: the buffalo's, however, are much larger, and take up more room, and indeed gave us no little trouble in clearing them away; for the diameter of this creature's body was full three feet.

"Upon the whole, the size of the buffalo was as follows: the length eight feet, the height five and a half, and the fore legs two feet and a half long; the larger hoofs were five inches over; from the tip of the muzzle to the horns was twenty-two inches. This animal in shape, as may be seen in the plate, very much resembled the common ox; but the buffalo has much stouter limbs, in proportion to its height and length. Their fetlocks hang likewise nearer to the ground. The horns are singular, both in their form and position: the bases of them are 13 inches broad, and are only an inch distance from each other; by which means, there is formed between them a narrow channel or furrow, in a great measure bare of hair. Measuring them from this furrow, the horns rise up in a spherical form, with an elevation of three inches at most. In this way they extend over a great part of the head, viz. from the nape of the neck to the distance of three and a half inches from the eyes; so that the part from which they grow out, does not occupy a space of less than 18 or 20 inches in circumference. From hence bending down on each side of the neck, and becoming more cylindrical by degrees, they each of them form a curve, the convex part of which is turned towards the ground, and the point up in the air; which, however, at the same time is generally inclined backwards. The distance between the points of the horns is frequently above five feet; the colour of them is black; and the surface, to within about a third part of them, measured from the base, is very rough and craggy, with cavities sometimes an inch deep. Neither these cavities, nor the elevations which are formed between them, appear to be at all accidental, as there is a tolerable similarity between these excrescences, though they are very different in different buffaloes. The ears are a foot in length, somewhat pendant, and in a great measure covered and defended by the lower edges of the horns. The edges of the ears are notched and shrivelled up in divers ways, which probably proceeds from the wounds these creatures frequently receive in their battles with each other, and from the rents they get in the briars and almost impenetrable thickets through which they pass, together with other casualties of that nature: Though several Hottentots have been induced from thence to imagine, that the buffaloes belonged to certain supernatural beings, who marked these animals in this manner for their own cattle. By way of naming these beings to me, they made use of the word *duyvel*, which means devil.

"The hairs of the buffalo are of a dark brown colour, about an inch long; harsh; and on such males as are advanced in years, very thin, especially on the middle of the sides of the belly: hence they appear at some distance as if they were girt with a belt; and what contributes not a little to this appearance is, that the buffaloes in general are very fond of rolling in the mire. The hairs on the knees are in most buffaloes somewhat longer than those on the rest of the body, and lie as it were in whirls. The eyes are somewhat

Plate Cl.

fank

Bos. sunk within their prominent orbits. This, together with the near situation of them to the bases of the horns, which hang somewhat over its pendant dangling ears, and its usual method of holding its head inclined to one side, gives the buffalo a fierce and treacherous aspect. The disposition likewise of the animal seems to correspond with its countenance. He may in some sort be called treacherous, as he is wont to hide himself among the trees, and stand there skulking till somebody happens to come very near him, when he rushes out at once into the road, and attacks them. This animal likewise deserves the appellation of fierce and cruel; as it has been remarked, that, not content with throwing down and killing the person whom he attacks, he stands over him afterwards, in order to trample upon him with his hoofs and heels, at the same time crushing him with his knees, and with his horns and teeth tearing to pieces and mangling the whole body, and stripping off the skin by licking it with his tongue. This, however, he does not do all at once, but at intervals, going away between whiles to some distance off. Notwithstanding all this, the buffalo will bear to be hunted; though sometimes he will turn and hunt his pursuer, whose only dependence in that case is upon the swiftness of his speed. The sure way to escape from him is to ride up some hill, as the great bulk of the buffalo's body, like that of the elephant, is a weight sufficient to prevent him from being able to vie with the slender and fine limbed horse in swiftness; though, on the other hand, the buffalo, in going down-hill, gets on much faster than the horse; a fact to which I have more than once been an eye-witness.

"The flesh of the buffalo is coarse and not very fat, but full of juice, and of a high and not disagreeable flavour. The hide is thick and tough, and is in great request with the farmers for thongs and harnesses. Of it we made the only halters that can be depended upon for securing our horses and oxen; so that these beasts cannot get loose by snapping them asunder, which they are otherwise apt to do when the lions and wolves make their appearance in the neighbourhood. Every such halter should be a finger and a half in breadth and about three yards long, and are sold a good way up in the country for a quarter of a rix-dollar a-piece.

"The hide of the buffalo we had now shot, after it had been dressed in some sort by my Hottentots, by being stretched out and salted a little, and afterwards half dried, served to make a pair of new four-plaited traces for my waggon. We observed, that the ball had hit the lower part of the neck, and entered the lungs; where, though it did not seem to have struck against any bone, and though it was alloyed with the usual quantity of tin, it was yet found to be pretty much flattened. In other buffaloes that we shot since, I have sometimes found the balls, though alloyed with tin, shivered into several pieces against the bones in the internal parts, or at least very much flattened. It is not, therefore, worth while to set about shooting the buffalo with balls made of lead only, for they will seldom be able to penetrate into those parts where they are likely to prove mortal. Besides being possessed of the degree of hardness requisite, a ball should be of a tolerable size, in order to kill so large an animal as the

buffalo. The least that ought to be used for this purpose should weigh two ounces and a quarter.

"My Hottentots showed so much diligence and zeal both in cutting up and eating this beast, that the encouragement and stimulation which is otherwise frequently necessary to set their sluggish and heavy souls in motion, would on this occasion have been quite superfluous. They drove the waggon then up to the place where the beast lay, and loaded it with the best and fattest part of the flesh. The raw hide, which was of considerable weight and extent, was tied under the waggon till it should be wanted, and the two remaining legs or marrow-bones were fastened to each side of the body of the waggon. Notwithstanding this, our Boshies-men had each of them loaded themselves with a quantity of slips of flesh made up into bundles. Thus covered up to the eyes and ears in meat, we made a singular appearance, which might have given any traveller who had happened to pass that way the idea of a walking flesh-market. As we proceeded on our journey, a swarm of other carnivorous animals in a considerable number, viz. eagles, falcons, and common hawks, were seen soon afterwards to occupy our places about the buffalo's remains; though we saw none of them either in the trees or flying about in the air till we had got to the distance of a few gun-shots from the spot."

Another hunt of this formidable animal he afterwards describes as follows: "There was now again a great scarcity of meat in the waggon; for which reason my Hottentots began to grumble, and reminded me that we ought not to waste so much of our time in looking after insects and plants, but give a better look out after the game. At the same time they pointed to a neighbouring dale over-run with wood, at the upper edge of which, at the distance of a mile and a quarter from the spot where we then were, they had seen several buffaloes. Accordingly we went thither; but though our fatigue was lessened by our Hottentots carrying our guns for us up a hill, yet we were quite out of breath and overcome by the heat of the sun before we got up to it. Yet, what even now appears to me a matter of wonder is, that as soon as we had got a glimpse of the game, all this languor left us in an instant. In fact, we each of us strove to fire before the other, so that we seemed entirely to have lost sight of all prudence and caution. When we advanced to within twenty or thirty paces of the beast, and consequently were perhaps likewise in some degree actuated by our fears, we discharged our pieces pretty nearly at the same time; while the buffalo, which was upon rather lower ground than we were, behind a thin scrambling bush, seemed to turn his head round in order to make towards us. In the mean while, however, the moment we had discharged our guns, we had the pleasure to see him fall, and directly afterwards run down into the thickest part of the wood. This induced us to hope that our shot had proved mortal; for which reason, we had the imprudence to follow him down into the close thickets, where luckily for us we could get no farther. We had, however, as we found afterward, only hit the hindmost part of the chine, where the balls, which lay at the distance of three inches from each other, had been shivered to pieces against the bones. In the

Bos.

mean while our temerity, which chiefly proceeded from hurry and ignorance, was considered by the Hottentots as a proof of spirit and intrepidity hardly to be equalled; on which account, from that instant they ever after appeared to entertain an infinitely higher opinion of our courage than they had ever done before. Several of our Hottentots now came to us, and threw stones down into the dale, though without success, in order to find out by the howlings of the beast whether he had retired: afterwards, however, he seemed to have plucked up his courage; for he came up at last out of the dale of his own accord to the skirts of the wood, and placed himself so as to have a full view of us on the spot where we were resting ourselves somewhat higher up: his intention was, in all probability, and in the opinion of our old sportsmen, to revenge himself on us, if we had not happened to see him in time, and fired at him directly. What, perhaps, in some measure put a stop to his boldness was, that we stood on higher ground than he did: for several veteran sportsmen have assured me of it as a fact, that they know from experience, that the buffaloes do not willingly venture to ascend any hill or eminence in order to attack any one. The third shot, which afterwards was observed to have entered at the belly, was fatal. This occasioned the buffalo to take himself down again into the vale, dyeing the ground and bushes all the way he went with his blood. Though still hot upon the chase, yet we advanced with the greatest caution, accompanied by two of our Hottentots, thro' the thin and more pervious part of the wood, where the buffalo had taken refuge. He was advancing again in order to attack some of us, when Mr Immelman, from the place where he was posted, shot him in the lungs. Notwithstanding this, he had still strength enough left to make a circuit of a hundred and fifty paces, before we heard him fall: during his fall, and before he died, he bellowed in a most stupendous manner: and this death-song of his inspired every one of us with joy, on account of the victory we had gained: and so thoroughly Steeleed is frequently the human heart against the sufferings of the brute creation, that we hastened forwards, in order to enjoy the pleasure of seeing the buffalo struggle with the pangs of death. I happened to be the foremost amongst them; but think it impossible for anguish, accompanied by a savage fierceness, to be painted in stronger colours than they were in the countenance of this buffalo. I was within ten steps of him when he perceived me, and bellowing raised himself suddenly again on his legs. I had reason to believe since, that I was at the time very much frightened; for before I could well take my aim, I fired off my gun, and the shot missed the whole of his huge body, and only hit him in the hind legs, as we afterwards discovered by the size of the ball. Immediately upon this I flew away like lightning, in order to look out for some tree to climb up into. Notwithstanding the tedious prolixity it might occasion me to be guilty of, I thought the best and readiest method of giving my reader an idea of the nature of this animal, and of the method of hunting it, as well as of other contingent circumstances, would be to adduce an instance or two of what occurred during the chase. My Hottentots cut up the buffalo with their usual alacrity and ardour; but as they had a great way to

carry the flesh to the waggon, they took it thither in a rather unusual way. This was as follows: they cut out large slips of flesh, whole and entire, with holes in the middle, wide enough for them to put their heads and arms through, and loaded themselves with it in this manner before, behind, and on every side of them; the meat all the while dangling about their bodies in a manner ludicrous enough, though not much adapted to create an appetite in the spectator. In this way, their hands being entirely disengaged, excepting that each man carried a stick, they clambered up the brow of the hill that overhung the vale, and thus walked on towards the waggon, whither one might trace them all the way by the blood."

IV. The GRUNNIENS, or hog-cow, has cylindrical horns bent backwards. The body is so hairy, that the hair hangs down upon its knees like a goat. The colour of the body is black, but the front is white. It has bristles on its back, tail, and hind-legs, and it grunts like an hog. It is an inhabitant of the north of Asia.

a. A variety of this species is the *Indian ox*, with a vast lump on the shoulders. They differ much in size and in the form of their horns. Some are very large, and of a reddish colour; with horns short, and bending close to the neck; others very small, with horns almost upright, bending a little forward. In Surat is a minute kind not bigger than a great dog, which have a very fierce look, and are used to draw children in small carts, In Celebes is a small species not bigger than a middle-sized sheep, called *Ausa*, very fierce and wild, of a dark ash-colour, inhabiting the rocks. Mr Loten, when in India, put some of them into a paddock, and in one night's time they killed 14 or 15 of his deer by ripping up their bellies.

V. The *BEVALUS*, or common buffalo, has large black horns bent backward and inward, and plain before. The hair on the back is very hard, but thinly scattered over the body. It is a native of Asia; but they are tamed in Italy, and used for the same purposes as black cattle in other countries. They draw carriages, and are guided by a rope tied to a string thrust through their noses. This buffalo is larger than an ox, has a thicker body, and a very hard hide. His pace is slow; but he will carry a great burden. They feed in herds like cows; and yield plenty of milk, of which very good butter and cheese is made. Their flesh is pretty good, but not to be compared to beef. The wild buffalo is a very fierce and dangerous animal; he often attacks travellers, and tears them in pieces. However, they are not so much to be feared in woods as in the plains, because their horns, which are sometimes ten feet long, are apt to be entangled in the branches of trees, which gives those who are surpris'd by them time to escape. They are excellent swimmers, and will cross the largest rivers without any difficulty. They run wild in great troops on the coast of Malabar; for which reason strangers are allowed to hunt and kill them at pleasure.

VI. The *INDICUS*, or little Indian buffalo, has horns shorter than its ears, a bunch on its back, and no mane. It is about the size of a calf six months old, and used in the East Indies for drawing coaches.

BOS, in antiquity, was peculiarly used for an ancient Greek silver coin, which was *distrachus*, or equivalent to two Drachms. It was so called, having on it

Bos.

Bofa
||
Bofcawen.

the imprefion of an ox, and chiefly obtained among the Athenians and Delians; being fometimes alfo struck of gold. From this arofe the phrafe *Bos in lingua*, applied to thofe who had taken bribes to hold their tongue.

BOSA, a maritime town in the western part of the island of Sardinia, with a caſtle, a good port, and a biſhop's ſee. It is feated on the river Boſa, to the north-eaſt of an island of the ſame name; and has good falt-pits. E. Long. 8. 30. N. Lat. 40. 19.

BOSCAGE, the fame with a grove or thicket.

BOSCAZE, in a law ſenſe, is that food which trees yield to cattle; as maſt, &c. But Manwood ſays, to be quit of boſcave is to be diſcharged of paying any duty for windfall wood in the foreſt.

BOSCAZE, among painters, denotes a landſcape repreſenting much wood and trees.

BOSCAN (John), a Spaniſh poet of the 16th century, born at Barcelona. He was the friend of Garcilaſſo de Vega, another Spaniſh poet. Theſe two were the firſt who made any great improvement in the poetry of their nation, and their pieces were printed together. Boſcan, who died about the year 1542, principally ſucceeded in ſonnets.

BOSCAWEN (Edward), a brave Britiſh admiral, was the ſecond ſon of Hugh late lord viſcount Falmouth. Having early entered into the navy, he was, in 1740, captain of the Shoreham; and behaved with great intrepidity as a volunteer under admiral Vernon, at the taking of Porto Bello. At the ſiege of Carthage, in March 1740-1, he had the command of a party of ſeamen who reſolutely attacked and took a battery of 15 twenty-four pounders, though expoſed to the fire of another fort of five guns. Lord Aubrey Beauclerk being killed at the attack of Boca-Chica, captain Boſcawen ſucceeded him in the command of the prince Frederic of 70 guns. In May 1742, he returned to England, and married Frances daughter of William Glanville, Eſq; and the ſame year was elected repreſentative for Furo in Cornwall. In 1743, he was made captain of the Dreadnought of 60 guns; and ſoon after he took the Media, a French man of war commanded by M. Hoquart, the firſt king's ſhip taken in that war. May 3. 1747, he ſignalized himſelf under the admirals Anſon and Warren, in an engagement with the French fleet off Cape Finiſterre, and was wounded in the ſhoulder with a muſket ball. Here M. Hoquart, who then commanded the Diamond of 56 guns, again became his priſoner; and all the French ſhips of war, which were ten in number, were taken. On the 15th of July, he was made rear-admiral of the blue, and commander in chief of the land and ſea forces employed on an expedition to the Eaſt Indies; and, on the 4th of November, ſailed from St Helen's, with ſix ſhips of the line, five frigates, and 2000 ſoldiers. On the 29th of July 1748, he arrived at St David's, and ſoon after laid ſiege to Pondicherry; but the men growing ſickly, and the monſoons being expected, the ſiege was raiſed, and Mr Boſcawen ſhewed himſelf as much the general as the admiral in his retreat. Soon after he had news of the peace, and Madraſs was delivered up to him by the French. In April 1750, he arrived at St Helen's in the Exeter, and found that in his abſence he had been appointed rear-

admiral of the white. He was the next year made one of the lords commiſſioners of the admiralty, and choſen an elder brother of the Trinity-houſe. In February 1755, he was appointed vice-admiral of the blue. On the 15th of April, ſailing in order to intercept a French ſquadron bound to North America, he fell in with the Alcide and Leys of 64 guns each, which were both taken: on this occaſion M. Hoquart became his priſoner a third time, and he returned to Spithead with his prizes and 1500 priſoners. In 1756, he was appointed vice-admiral of the white; and in 1758, admiral of the blue, and commander in chief of the expedition to Cape Breton; when, in conjunction with general Amherſt, and a body of troops from New England, the important fortrefs of Louiſbourg and the whole island of Cape Breton was taken, for which he afterwards received the thanks of the Houſe of Commons. In 1759, being appointed to command in the Mediterranean, he arrived at Gibraltar, where hearing that the Toulon fleet, under M. de la Clue, had paſſed the Straits, in order to join that at Brett, he got under ſail, and on the 18th of Auguſt ſaw, purſued, and engaged the enemy. His ſhip, the Namur of 90 guns, loſing her main-maſt, he ſhifted his flag to the Newark; and, after a ſharp engagement, took three large ſhips, and burnt two in Lagos-bay, and the ſame year arrived at Spithead with his prizes and 2000 priſoners. On December 8. 1760, he was appointed general of the marines with a ſalary of L. 3000 *per annum*, and was alſo ſworn one of the privy-council. He died in 1761.

BOSCH (Jacob Vanden), a painter of ſtill life, was born at Amſterdam in 1636, and painted ſummer fruits of various kinds, peaches, pears, apples, plums, neſtarines, and cherries, with extraordinary neatneſs of pencil. He painted all his objects after nature, and imitated every ſort of fruit, with ſo great truth and delicacy, with ſuch natural and tranſparent colour, that they appeared delicious, and almoſt real. He died in 1676.

BOSCHAERTS (Thomas Willborns), a celebrated painter, was born at Bergen-op-room; and, like the great painters who flouriſhed at that time, began to draw, when very young, in the books that were intended for other ſtudies. Preferring his pencil to every thing elſe, he drew his own picture, by his reſemblance in a looking-glaſs, ſo like, that thoſe who ſaw it were aſtoniſhed. This he did before he had the leaſt inſtruction from any one, and when he was only 12 years of age. Upon this his parents ſent him to a maſter, that he might follow the bent of his genius; but his firſt maſter being only an indifferent painter, and incapable of ſatiſfying his curioſity deſire of learning, he left him, and engaged himſelf with Gerard Segers; under whom, after four years practice, he proved a moſt accompliſhed artiſt. Antwerp being at that time the ſeat of arts, where there was a conflux of the moſt eminent painter, he thought it the fitteſt place for his improvement; and there executed ſuch a number of noble pieces as added greatly to the ſplendor of that wealthy city. In 1642, Henry Frederick prince of Orange, and his ſon prince William, employed him in their ſervice; in which he continued ſeveral years, and made thoſe excellent pieces that are to be ſeen in that prince's palace at the Hague and other parts of

Holland, and painted portraits for most of the persons of quality that were then living. He died in the flower of his age, in 1670.

BOSCO, or BOSCHI, a town of Italy, in the Milanese, seated on the river Olbe. E. Long. 9. 44. N. Lat. 44. 53.

BOSCOI, or BOSCI, in ecclesiastical history, denotes a species or tribe of monks in Palestine, who fed on grass like the beasts of the field. The word is Greek, βοσκος, q. d. "grazers;" formed from βοσκω, *bosco*, "I feed." The Boscoi are ranked among the number of Adamites, not so much on account of their habit, as food. They took no care about provision; but when eating-time came, or any of them was hungry, went into the fields, with each his knife in his hand, and gathered and eat what he could find.

BOSEA, GOLDEN-ROD TREE: A genus of the digynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 53d order, *Scabride*. The calyx is pentaphyllous; there is no corolla; and the berry is monospermous. Of this genus there is but one species, viz. the yersamora. This is a native of the Canary islands, and also of some of the Caribbees. It hath been long an inhabitant of the British botanic gardens, but hath never been observed to flower in this country. It is a pretty strong woody shrub, growing with a stem as large as a middling person's leg; the branches come out very irregular, and make considerable shoots every summer, which should be shortened in the spring. These branches retain their leaves till towards the spring, when they fall away, and new leaves are produced in their place. It may be propagated by cuttings planted in the spring; and the plants must be housed in winter, for they are too tender to bear the open air at that season of the year.

BOSHIES-MEN, a species of Hottentots, so called, according to Dr Sparman, from their dwelling in woody or mountainous places. They are sworn enemies to a pastoral life. Some of their maxims are, to live on hunting and plunder, and never to keep any animal alive for the space of one night. By this means they render themselves odious to the rest of the inhabitants of the Cape; and are pursued and exterminated like the wild beasts, whose manners they have assumed. Others of them again are kept alive, and made slaves of. Their weapons are poisoned arrows, which shot out of a small bow will fly to the distance of 200 paces, and will hit a mark with a tolerable degree of certainty at the distance of 50 or even 100 paces. From this distance they can by stealth, as it were, convey death to the game they hunt for food, as well as to their foes, and even to so large and tremendous a beast as the lion; this noble animal thus falling by a weapon which perhaps it despised, or even did not take notice of. The Hottentot, in the mean time, concealed and safe in his ambush, is absolutely certain of the operation of his poison, which he always culls of the most virulent kind; and it is said he has only to wait a few minutes in order to see the wild beast languish and die. The dwellings of these foes to a pastoral life are generally not more agreeable than their maxims and manners. Like the wild beasts, bushes and cliffs in rocks by turns serve them instead of houses; and some of them are said to be so far worse than beasts, that their

soil has been found close by their habitations. A great many of them are entirely naked; but such as have been able to procure the skin of any sort of animal, great or small, cover their bodies with it from the shoulders downwards as far as it will reach, wearing it till it falls off their backs in rags. As ignorant of agriculture as apes and monkeys, like them they are obliged to wander about over hills and dales after certain wild roots, berries, and plants (which they eat raw), in order to sustain a life that this miserable food would soon extinguish and destroy were they used to better fare. Their table, however, is sometimes composed of several other dishes, among which may be reckoned the larvæ of insects, or that kind of caterpillars from which butterflies are generated; and in like manner a sort of white ants (the *termites*), grasshoppers, snakes, and some sorts of spiders. With all these changes of diet, the Boshties-man is nevertheless frequently in want, and famished to such a degree as to wait almost to a shadow. "It was with no small astonishment (says Dr Sparman), that I for the first time saw in Lange Kloof a lad belonging to this race of men with his face, arms, legs, and body, so monstrously small and withered, that I could not have been induced to suppose but that he had been brought to that state by the fever that was epidemic in those parts, had I not seen him at the same time run like a lapwing. It required but a few weeks to bring one of these starvelings to a thriving state, and even to make him fat; their stomachs being strong enough to digest the great quantity of food with which they are crammed, as they may rather be said to bolt than eat. It sometimes happens indeed that they cannot long retain what they have taken in; but this circumstance, it is said, does not hinder them from beginning again upon a new score."

The capture of slaves from among this race of men is by no means difficult; and is effected (Dr Sparman informs us) in the following manner. "Several farmers that are a want of servants join together and take a joint stock in that part of the country where the Boshties are to be found, as well as their Lego-Hottentots. Some of such Boshties-men as have been caught before, and have been trained up to fidelity in their service, endeavour to spy out where the wild Boshties-men have their haunts. This is best discovered by the smoke of their fires. They are found in societies from 10 to 50 and 100, reckoning great and small together. Notwithstanding this, the farmers will venture in a dark night to set upon them with six or eight people, which they contrive to do by previously stationing themselves at some distance round about the camp. They then give the alarm by firing a gun or two. By this means there is such a consternation spread over the whole body of these savages, that it is only the most bold and intelligent among them that have the courage to break through the circle and steal off. These the captors are glad enough to get rid of at so easy a rate; being better pleased with these that are stupid, timorous, and struck with amazement, and who consequently allow themselves to be taken and carried into bondage. They are, however, at first treated by gentle methods; that is, the victors intermix the fairest promises with their threats, and endeavour, if possible, to shoot some of the

the larger kinds of game for their prisoners, such as buffaloes, sea-cows, and the like. Such agreeable baits, together with a little tobacco, soon induce them, continually cooered and feared as they are, to go with a tolerable degree of cheerfulness to the colonist's place of abode. There this luxurious junketting upon meat and fat is exchanged for more moderate portions, consisting for the most part of butter-milk, frumenty, and hasty-pudding. This diet, nevertheless, makes the Boshies-man fat in a few weeks. However, he soon finds his good living embittered by the mauling and grumbling of his master and mistress. The words *'guzeri* and *'yauunaji*, which perhaps are best translated by those of "young forcerer" and "imp," are expressions which he must frequently put up with, and sometimes a few curses and blows into the bargain; and this for neglect, remissness, or idleness; which last failure, if it cannot be said to be born with him, is however in a manner naturalised in him. So that, both by nature and custom detesting all manner of labour, and now from his greater corpulency becoming still more slothful, and having besides been used to a wandering life subject to no controul, he most sensibly feels the want of his liberty. No wonder, then, that he generally endeavours to regain it by making his escape: but what is really the subject for wonder is, that when one of these poor devils runs away from his service, or more properly bondage, he never takes with him any thing that does not belong to him. This is an instance of moderation in the savages towards their tyrants which is universally attested, and at the same time praised and admired by the colonists themselves; which, however, I cannot easily reconcile with what I have learned of the human heart. Is it in consequence of their fearing to meet with harder usage in case they should be retaken? Thus far, however, is certain, that none of this species of Hottentots are much given to violence or revenge. Free from many wants and desires that torment the rest of mankind, they are little, if at all, addicted to thieving, if we except brandy, victuals, and tobacco. It is not improbable, likewise, that the advantages accruing from a theft may be overlooked by them, when their thoughts are taken up with regaining their liberty, the greatest of all treasures. It is necessary to observe here, that some of the Hottentots or Boshies-men, who are thus forced into the service of the colonists, live in small societies peaceably and quietly in desert tracts, where the colonists cannot easily come at them, and are sometimes in the possession of a few cows. These people probably originate from Boshies-men who have run away from the colonist's service.

"I must conclude (continues our author), that the Boshies-men in some husbandmen's service are treated in the gentlest manner, and perhaps even without ever having a harsh word given them; live very well with regard to provisions; are well clad, relatively to their condition in life; and are very comfortably lodged, in comparison of what others are, in their own filthy cottages. The chief of their business perhaps consists in leading a herd of cattle or flock of sheep during the heat of the day, when they have an opportunity of getting into a gentle state of intoxication by smoking tobacco; a state which excites in them tentations

of as agreeable a nature as the frenzy produced by spirituous liquors and opium seems to afford to many others, who are never at ease but when they can procure to themselves this delicious pleasure. And yet, though they may thus agreeably pass away the otherwise tedious hours of their lives in smoking and sleep, they nevertheless generally run away. The colonists wonder at this, as a procedure entirely devoid of reason; without perceiving that in so doing they suppose the Hottentots not endued with a desire, which has its immediate foundation in nature, and which is common to the human race, and even to most brute animals; viz. an earnest longing after their birth-place and families, and especially after their liberty.

"The slave business, that violent outrage to the natural rights of mankind, always in itself a crime, and which leads to all manner of misdemeanors and wickedness, is exercised by the colonists in general with a cruelty towards the nation of Boshies-men which merits the abhorrence of every one; though I have been told that they pique themselves upon it; and not only is the capture of these Hottentots considered by them merely as a party of pleasure, but in cold blood they destroy the bands which nature has knit between husbands and their wives and children. Not content, for instance, with having torn an unhappy woman from the embraces of her husband, her only protection and comfort, they endeavour all they can, and that chiefly at night, to deprive her likewise of her infant; for it has been observed, that the mothers can seldom persuade themselves to flee from their tender offspring. The amiable tenderness of the mother, which perhaps glows with a more lively flame in the breast of this poor heathen than in those of her Christian tyrant, is the very circumstance laid hold on by their persecutors in order to rivet the chains of this wretched female so much the faster. There are some mothers, however, that set themselves free, when they have lost all hopes of saving their children. After having made their escape, they sometimes keep secretly about the neighbourhood, in hopes of finding some opportunity of recovering their infants again."

BOSNA-SERAGO, a large and strong town of Turkey in Europe, and capital of the province of Bosnia. E. Long. 18. 57. N. Lat. 44. 40.

BOSNIA, a province of Turkey in Europe, seated between Slavonia and Dalmatia. It belongs entirely to the Turks; but they were on the point of being expelled from it by the Christians, when the Spaniards invaded Sicily, and obliged the emperor to conclude the peace of Passarowitz in 1718, by which he gave up Bosnia to the Turks. It is 200 miles in length, and 75 in breadth. It is a barren country, and but little cultivated; the principal revenue arising chiefly from the silver mines. Among the game there are falcons, which are held in great esteem.

BOSPHORUS, or BOSFORUS, in geography, a long and narrow sea, which it is supposed a bullock may swim over. In a more general sense, it is a long narrow sea running in between two lands, or separating two continents, and by which two seas, or a gulph and a sea, are made to communicate with each other: In which sense, bosphorus amounts to the same with what we otherwise call an arm of the sea, channel, or strait:

Bosquet
||
Bosquetry.

the Italians, *firo*; the Latins, *selon*; and the French, *par, marche*. The word is Greek, $\beta\upsilon\lambda\lambda\omicron\varsigma$, formed from $\beta\upsilon\lambda\lambda\omicron\varsigma$ "bullock", and $\pi\omicron\sigma\sigma$ "passage."

The name *bosphorus*, is chiefly confined to two straits in the Mediterranean sea, viz. the *bosphorus of Thrace*, commonly called the *strait of Constantinople*, or *channel of the Black Sea*; and the *Cimmerian* or *Scythian bosphorus*, so called, it seems, from its resemblance to the Thracian; now more commonly the *strait of Kapsa*, or *Kederli*, from two cities standing on it.

The origin of the name is better agreed on than the reason why it was first given to the Thracian bosphorus. Nymphias tells us, on the authority of Oceanus, that the Phrygians, desiring to pass the Thracian strait, built a vessel, on whose prow was the figure of a bullock; and which was hence called $\beta\upsilon\lambda\lambda\omicron\varsigma$, "bullock;" and served them for a ferry-boat. Dionysius, Valerius Flaccus, Callimachus, Apollodorus, Marcellinus, &c. say, that Iö, being transformed into a cow by Juno, passed this strait swimming, which hence was called *bosphorus*. Arrian tells us, that the Phrygians were enjoined by the oracle, to follow the rout which a bullock should mark out to them; and that, upon stirring one up, it jumped into the sea to avoid their pursuit, and swam over this strait. Others say, that an ox, tormented by a gad-fly, threw itself in, and swam over; and others, that anciently the inhabitants of these coasts, when they would pass over, joined little boats together, and had them drawn over by bullocks, &c.

BOSQUETS, in gardening, groves so called from *boschetti*, an Italian word which signifies a *little wood*. They are compartments in gardens formed by branches of trees disposed either regularly in rows, or wildly and irregularly, according to the fancy of the owner. A bosquet is either a plot of ground inclosed with palisades of horn beam, the middle of it being filled with tall trees, as elm or the like, the tops of which make a tuft or plume; or it consists of only high trees, as horse-chestnut, elm, &c. The ground should be kept very smooth and rolled, or else covered with grass, after the manner of green plots. In planting bosquets, care should be taken to mix the trees which produce their leaves of different shapes, and various shades of green, and hoary or mealy leaves, so as to afford an agreeable prospect. Bosquets are only proper for spacious gardens, and require a great expence to keep them up.

BOSSAGE, in architecture, a term used for any stone that has a projecture, and is laid rough in a building, to be afterwards carved into mouldings, capitals, coats of arms, &c. Bossage is also that which is otherwise called *rustic work*; and consists of stones which advance beyond the naked, or level of the building, by reason of indentures or channels left in the joinings. These are chiefly used in the corners of edifices, and thence called *rustic quoins*. The cavities or indentures are sometimes round, sometimes chain-framed, or bevelled, sometimes in a diamond form, sometimes inclosed with a cavetto, and sometimes with a listel.

BOSSE (Abraham), an able engraver, born at Tours, was well skilled in perspective and architecture. He wrote two treatises, which are esteemed, the one on the manner of designing, and the other upon engraving.

BOSSINEY, or BOSS-CASTLE, a town of Cornwall. N^o 51.

BOSSON, in England, which sends two members to parliament. W. Long. 5. E. N. Lat. 50. 40.

BOSSU (René le), born at Paris in 1631, was admitted a canon regular in the abbey of St Genevieve, in 1649; and after a year's probation, took the habit. He taught polite literature with great success in several religious houses for 12 years, when he gave up the task for retirement. He then published a parallel betwixt the principles of Aristotle's natural philosophy and those of Des Cartes, with a view to reconcile them; which was but indifferently received. His next treatise was on epic poetry; which Bileau declared one of the best compositions on that subject in the French language, and which produced a great friendship between them. He died in 1680, and left a great number of MSS. which are kept in the abbey of St John de Chartres.

BOSSUET (James Benigne), bishop of Meux, was born at Dijon, on the 27th of September, 1627. He distinguished himself by his preaching, and the zeal he discovered in his endeavours to bring over the Protestants of France to the Romish church; by his opposition to Quietism; and by his numerous writings both in French and Latin, which have been collected together, and printed at Paris in 17 vols 4to. This famous divine died at Paris, in 1704, aged 77.

BOSSUPT, a town of the Austrian Netherlands, in the province of Brabant. E. Long. 4. 30. N. Lat. 50. 52.

BOSSUS (Matthew), distinguished by his virtue and his learning, was born in 1427. He devoted himself to the ecclesiastical state in 1451, in the congregation of regular canons of Lateran, and afterwards taught divinity at Padua. His orations, his sermons, and his letters, have been often printed. He also wrote a sort of an apology for Phalaris, and other works. He died at Padua in 1502, aged 75.

BOST, a very strong town of Persia, and capital of the province of Zabkhan. E. Long. 64. 15. N. Lat. 31. 50.

BOSTANGIS, in the Turkish affairs, persons employed in the garden of the seraglio, out of whose number are collected those that are to row in the Grand Signior's brigantines, when he has a mind to divert himself with fishing, or to take the air upon the canal. They who row on the left hand are only capable of mean employments in the gardens: but they who row on the right hand may be promoted to the charge of *bostangi-bachi*, who has the general intendency of all the Grand Signior's gardens, and commands above 10,000 *bostangis*.

BOSTON, a corporation-town of Lincolnshire in England, which sends two members to parliament. It is commodiously seated on both sides the river Witham, over which it has a handsome, high, wooden bridge; and, being near the sea, enjoys a good trade. It has a spacious market-place, and the largest parish church without cross isles in Europe, the steeple of which serves for a land-mark to sailors. Boston is a barony in the Irby family. E. Long. 0. 15. N. Lat. 53. 3.

BOSTON, the capital of New England in North America, built in 1630, in a peninsula of about four miles in circumference, at the bottom of Massachusetts bay, in a very convenient situation for trade. The following

Bos
||
Boston.

lowing is a description of this capital before the commencement of the present American war. "The town stands in W. Long. 71. 5. N. Lat. 42. 24. about nine miles from the mouth of the bay. At the entrance of this bay are several small rocks which appear above water, and upwards of a dozen of small islands, some of which are inhabited. There is but one safe channel to approach the harbour; and that so narrow, that two ships can hardly fail through abreast; but within the harbour there is room for 500 sail to lie at anchor in a good depth of water. On one of the islands of the bay stands Fort William, the most regular fortress in British America. This castle is defended by 100 guns, 20 of which lie on a platform level with the water, so that it is scarce possible for an enemy to pass the castle. To prevent surprise, they have a guard placed on one of the rocks, at two leagues distance, from whence they make signals to the castle when any ships come near it. There is also a battery of guns at each end of the town. At the bottom of the bay is a noble pier near 2000 feet in length; along which on the north side extends a row of warehouses for the merchants; and to this pier ships of the greatest burden may come and unload without the help of boats. The greatest part of the town lies round the harbour in the form of a half moon, the country beyond it rising gradually and affording a delightful prospect. The neck of land which joins the peninsula to the continent is but 40 yards over; which situation, if properly improved, might render the town impregnable on the land side. Boston contains

only about 18,000 inhabitants. They were more numerous 50 years ago; but the surprising increase of Newbury port, Salem, Marble-head, Cape Ann, Plymouth, Dartmouth, and the island of Nantucket, checked the growth and trade of the capital. The trade of Boston, however, was so considerable, that, in 1768, 1200 sail entered and cleared at the custom-house there. The predominant religion is the Independent; though there are other persuasions, and ten churches serve for them all, but the Independents have five." Boston has frequently suffered by fire, but the houses that were thus destroyed have always been rebuilt to advantage. The late American war began here by the attack at Bunker's-hill, where many brave men lost their lives.

BOSWORTH, a town of Leicestershire in England, situated in W. Long. 1. 24. N. Lat. 52. 45. It has a lofty situation on a hill, and the country about it is fertile in corn and grass. It is memorable for the decisive battle fought near it between Richard III. and the earl of Richmond, afterwards Henry VII. wherein the former lost his crown and life.

BOTALLUS (Leonard), physician to the duke of Alençon, and to Henry III. was born at Asli in Piedmont. He introduced at Paris the practice of frequent letting of blood; which was condemned by the faculty; but soon after his death it came into practice with all the physicians. He published several books in physic and surgery; and the best edition of his works is that of Leyden in 1662, octavo.

B O T A N Y,

IN the utmost extent of the word, signifies a knowledge of plants, and of the uses to which they may be applied, either in medicine, chemistry, or in the different arts. But as the medical virtues of plants fall properly under the province of the physician, their chemical properties belong to the chemist, &c.; hence the science of botany is commonly restricted to a bare knowledge of the different plants themselves, and of the distinguishing marks whereby each individual species may be known from every other. This knowledge is indispensably necessary for those who propose to apply plants to any useful purpose: for example, though we should suppose a physician ever so well acquainted with the virtues of opium, and a chemist ever so well acquainted with the method of preparing it, yet if both of them were entirely ignorant of botany, so as to be unable to distinguish the particular species of poppy which produces opium from others of the same genus, it is evident their medicinal and chemical skill could be of no use.

The utility of botanical classifications may be further illustrated from the following considerations.

1. With regard to *Fœta*. Many animals are endowed with an instinctive faculty of distinguishing with certainty whether the food presented to them be salutary or noxious. Mankind have no such instinct. They must have recourse to experience and observation. But these are not sufficient to guide us in every case. The traveller is often allured by the agreeableness of smell and taste to eat poisonous fruits. Neither will a gene-

ral caution, not to eat any thing but what we know from experience to be salutary, answer in every emergency. A ship's company, in want of provisions, may be thrown upon an uninhabited coast or a desert island. Totally ignorant of the nature of the plants they meet with, diseases, or scarcity of animals, may make it absolutely necessary to use vegetable food. The consequence is dreadful: they must first eat before any certain conclusion can be formed. This is not the description of danger arising from an imaginary situation. Before the vegetables that grow in America, the East and West Indies, &c. became familiar to our sailors, many lives were lost by trials of this kind: neither has all the information received from experience been sufficient to prevent individuals from still falling a prey to ignorance or rashness.—If the whole science of botany were as complete as some of its branches, very little skill in it would be sufficient to guard us infallibly from committing such fatal mistakes. There are certain orders and classes which are called *natural*, because every genus and species comprehended under them are not only distinguished by the same characteristic marks, but likewise possess the same qualities, though not in an equal degree. For example: Show a botanist the flower of a plant whose calyx is a double-valved globe, with three stamina, two pistils, and one naked seed; he can pronounce with absolute certainty, that the plant from which the flower was taken, bears seeds of a farinaceous quality, and that they may be safely used as food. In like manner, show him a flower with 12 or more sta-

mina all inserted into the internal side of the calyx, tho' it belonged to a plant growing in Japan, he can pronounce without hesitation, that the fruit of it may be eat with safety. On the other hand, show him a plant whose flower has five stamina, one pistil, one petal, or flower-leaf, and whose fruit is of the berry kind, he will tell you to abstain from it, because it is poisonous. Facts of this kind render botany not only a respectable, but a most interesting, science.

2. With respect to *Medicine*, the same thing holds good. It is found by experience, that plants which are distinguished by the same characters in the flower and fruit have the same qualities, though not always in an equal degree as to strength or weakness; so that, upon inspection of the flower and fruit, a botanist can determine *a priori* the effects that will result when taken into the stomach. In order, therefore, to determine the medical virtues of all the plants belonging to a natural class, the physician has nothing to do but to ascertain by a set of clear and unquestionable experiments, the virtues of any one of them. This greatly shortens the labour of investigation. Supposing the number of known species to be 20,000; by ascertaining the virtues of one genus, at a medium, you determine the virtues of 12 species. But by ascertaining the virtues of one genus belonging to a natural order, the virtues of perhaps 300 or 400 species are ascertained.

Sect. I. *History of Botany.*

THE origin of this science, like that of most others, cannot be found out from the most ancient histories; but it is very probable, that some degree of botanical knowledge has existed in every age of the world. The first botanical writings of which we have any account are those of Solomon, who we are informed by scripture wrote a treatise upon this subject; which, however, is absolutely lost, not being quoted by any ancient author, nor the least fragment of it remaining. Among the Greeks, Anaxagoras, Pythagoras, and other ancient philosophers, wrote treatises on plants; but their works are also lost; and from the quotations that yet remain in the works of Theophrastus, Dioscorides, and Pliny, we learn, that those first botanical writings could convey but very little knowledge.

The historical æra of botany, therefore, commences with Theophrastus the disciple of Aristotle. He was born at Eresium, in the island of Lesbos; and flourished in the third century before the Christian æra, being about 100 years posterior to Hippocrates. His work is intitled *The History of Plants*, and treats of their origin, propagation, anatomy, and construction; of vegetable life, and of vegetation. It consisted originally of ten books; but of which only nine are now extant. In these, vegetables are distributed into five classes or primary divisions; which have for their object, the generation of plants; their place of growth; their size, as trees and shrubs; their use, as pot-herbs and esculent grains; and their lactescence, or the liquor, of whatever colour, that flows from plants when cut. In his work, about 500 different plants are described.

The next botanist of any note was Dioscorides, a Grecian by birth, but under the Roman empire, being near 400 years posterior to Theophrastus. He de-

scribes about 600 plants; and these he has arranged, from their uses in medicine and domestic œconomy, into four classes, which are thus designed: aromatics; alimentary vegetables, or such as serve for food; medicinal, and vinous plants.

Almost cotemporary with Dioscorides flourished Antonius Musa, Cato, Varro, Virgil, and Columella; the first, author of a treatise still extant on the plant botany; the four others celebrated for their useful tracts on agriculture and rural œconomy.

Pliny the Elder, in his voluminous work intitled *The History of the World*, hath a botanical part which is contained in 15 books. In these, besides the plants of Theophrastus and Dioscorides, he has given descriptions of several new species, extracted probably from works which would otherwise have been totally lost. Pliny uses scarce any mode of arrangement, except the ancient, but very incorrect, distinction into trees, shrubs, and herbs. His plan, however, extends not only to botanical distinctions, but to gardening, agriculture, and whatever is connected either more nearly or remotely with the science of plants. He gives descriptions of above 1000 different species; but from the want of a proper systematic arrangement, it is often difficult, and perhaps impossible, to determine what plants he or other ancient botanists do really describe.

This want of precision in properly arranging their plants was the reason why the botany of the ancients was always very limited, and after the time of Pliny declined so rapidly. On the destruction of the western empire by the Goths and other barbarous nations, it is not to be thought that botany could survive any more than the other sciences. It was not till near the close of the eighth century, that the ancient botany began again to appear in Arabia. Serapion, well known in medicine, stands first in the Arabian catalogue of botanists; to him succeeded Rasis, Avicenna, Averrhoes, Actuarius, &c. An author known by the name of *Plato Apuleius*, or *Apulensis*, of whose *Herbarium* very old manuscript copies are preserved in some curious libraries, is supposed to have lived near this period. The works of most of these botanists, however, were only translations and compilations from the Greek writers; so that, for want of a proper systematic arrangement, the science sunk a second time into total oblivion. For near 400 years after Abenguefit, an Arabian physician who flourished in the end of the 12th century, scarce any attempts were made in the botanical way. Some obscure writers indeed appeared in several parts of Europe; as Arnoldus de Villa Nova; Platearius; Mattheus Sylvaticus; and Bartholomew Glanvil, commonly called *Bartholomew Anglus*, a Franciscan monk, descended of the family of the Earls of Suffolk, who lived in the reign of King Edward III. and wrote a book of natural history, intitled *De proprietatibus rerum*, which was translated into English by John de Trevisa in 1398; but though all these wrote of plants, they were so totally destitute of method, that their works remain one great chaos, from whence it is impossible to extract any thing intelligible.

On the revival of letters in the beginning of the 16th century, the botany of the ancients was restored a second time. The Greek writings were translated into Latin, the common language of Europe. Gaza, a Greek refugee at Rome, made elegant translations of Aristotle's

Aristotle and Theophrastus, who afterwards were commented upon by Scaliger and Stapel. Dioscorides was also translated and commented on. His best commentators are Hermolaus Barbarus, Fuchsius, Ruellus Cordus, Gesner, and Matthioli. The most distinguished commentators of Pliny are Dalechamp in 1604, Salmasius in 1689, Harduin, and Guilandinus. Meunius and Urfinus have written commentaries upon Cato; Campegius and Monardes upon Mesue the Arabian, and Lonicer upon Avicenna. This last hath been translated by several writers, particularly Alpagus, Costæus, and Plempius, into Latin; and by one writer, Amalthæus, into Hebrew.

Hieronymus Bock, or Bouc, a German, generally known by the name of *Tragus*, is the first modern who has given a methodical distribution of vegetables. In 1532, he published a History of Plants, in which he describes 800 species; and these he divides into three classes, founded on the qualities of vegetables, their figure, habit, and size. The same method of arrangement was followed by Lonicer, Dodonæus, L'Obel, Clusius, Brunsellius, Monardes, Cordus, and some other botanists of this period. How far such a method was deficient, shall be considered in the following section; however, it was not till 1560 that Conrad Gesner first proposed to the world an arrangement of vegetables from the parts of the flower and fruit. He did not establish any plan founded upon this principle; but, having suggested the idea, left the application to be made by others: and in 1582, Dr Andrew Cæsalpinus, physician at Pisa, and afterwards professor of botany at Padua, first availing himself of the ingenuity of his predecessor, proposed a method of arrangement which has the fruit for its basis; and thus gave origin to systematic botany, the second grand æra in the history of that science.

Even this improved method of Cæsalpinus was not without very great inconveniences, which shall be taken notice of hereafter. As it was, however, so greatly superior to every thing that had appeared before, it might have been expected that the learned would have immediately adopted it, and that all the former equivocal and insufficient characters would have been rejected. But the fact was otherwise. Cæsalpinus's method of arrangement died with him; and it was not till near a century after, that Dr Robert Morison of Aberdeen, attaching him to the principles of Gesner and Cæsalpinus, re-established scientific arrangement upon a solid foundation; so that, from being only the restorer of system, he has been generally celebrated as its founder. In the long interval between Cæsalpinus and Morison, flourished some eminent botanists. The most noted are, Dalechamp, author of A general History of plants; Theodore, surnamed *Tabernaemontanus*, and Thalius, two German writers; Porta, an Italian, famous for an arrangement of plants from their relations to the stars, to men, and other animals; Prosper Alpinus, author of a Catalogue of the plants of Egypt; Fabius Columna, inventor of many of the botanical terms now used; the two Buhins; Gerard, and Parkinson; Zaluzianski, a Pole, author of an arrangement from the qualities and habit of plants; Maregrave and Piso, celebrated for their Natural History of Brasil; Hernandez, equally celebrated for his History of Mexi-

co; Passæus, or Du Pas, author of an arrangement of plants from the time of flowering, of all characters the most uncertain and insufficient; Johnston; Bontius, a Dutchman, author of a Natural History of the East Indies; Aldrovandus, the celebrated naturalist; and Rheede, governor of Malabar, and author of the well-known *Hortus Malabaricus*.

The method proposed by Morison has the fruit for its basis, as well as that of Cæsalpinus; to which, however, it is greatly inferior both in the plan and execution. It is indeed of all others the most difficult in practice; and was therefore not adopted by any succeeding writer, except Bobart, who in 1699 completed Morison's Universal History of Plants, and an anonymous author whose work appeared in 1720. Imperfect, however, as his method is, it furnished many useful hints, which succeeding botanists have not failed to improve. Ray and Tournefort have owed him much, and are not ashamed to own the obligation. The same has been done even by Linnaeus; who hath established the science of botany on the most solid foundation, by introducing a method of arrangement, if not absolutely perfect, at least as nearly approaching to perfection as can be expected; and therefore hath been deservedly followed, in preference to every other, by all botanists, since its first publication. But to give a particular account of all the different botanical systems, with the particular advantages and disadvantages attending each, shall be the business of the subsequent sections.

SECT. II. *Of the Ancient Method of arranging Vegetables.*

IN giving an account of the works of Theophrastus and Dioscorides, we have already taken notice that the former chose seven distinguishing characters, *viz.* the generation of plants; their place of growth; their size, as trees and shrubs; their use, as pot-herbs and esculent grains; and their lactescence, or liquor that flows from them when cut. Dioscorides divided them into aromatics, alimentary, medicinal, and vinous plants. The good properties of this method are, that the botanist as it were comes to the point at once; and when he knows the plant, knows also its virtues and uses, or at least part of them: but this convenience is greatly overbalanced by innumerable disadvantages; for the qualities and virtues of plants are neither fixed and invariable, nor are they impressed in legible characters on the plants themselves. The different parts of a plant often possess different and even opposite virtues; so that supposing the virtues to be known, and applied to the purpose of vegetable arrangement, the root must frequently fall under one division, the leaves under a second, and the flower and fruit under a third. Besides, if we reflect that the sole end of such arrangement is to facilitate the knowledge of plants to others, the insufficiency and even absurdity of methods founded upon their virtues will immediately appear. A stalk of vervain, for instance, is presented to me, which I am to investigate from a presupposed knowledge of the virtues of plants. Before I can settle the class to which it belongs, I must discover whether or not it has the virtues belonging to any of the plants I know; and this dif-

covery being the result of repeated experiments on various parts of the human body, may require many years for its accomplishment.

The same causes which render methods founded on the virtues of plants unfavourable for the purpose of investigation, must evidently disqualify all their other variable quantities and accidents from having a place in a genuine systematic arrangement. The *natale plantum* of plants, which is one of Theophrastus's divisions, affords no better distinctive characters than their powers and virtues. Many countries as well as many soils produce the same individual plants. The same species which crown the mountains, frequently cover the fens; and plants which have long been reckoned the peculiar inhabitants of some parts of Asia and America, are now found to grow naturally in equal perfection in the very different climates of Lapland and Siberia. The size of plants, which suggested the ancient division into trees and shrubs, is no less an equivocal mark of distinction than the circumstances already mentioned. The vine, which modern botanists designate a shrub, was ranged by Theophrastus in his third class containing trees. In fact, every thing respecting size is so much affected by differences of soil, climate, and culture, that the same plant, in different circumstances, shall differ exceedingly in height: and in a method founded upon the size, would sometimes be ranged as a tree, and sometimes as a shrub, or even an under-shrub, according as it happens to exceed, equal, or fall short of, a given standard. No less insufficient are characteristical marks drawn from the colour, taste, and smell of plants. Of all the attributes of vegetable nature, colour is perhaps the most inconstant. Heat, climate, culture, soil, &c. contribute to the production of endless diversities of colour, and render the transition from one to another natural and easy. Red and blue pass easily into white, white into purple, yellow into white, red into blue, blue into yellow, &c. In the same leaf or flower, different colours are frequently observed. Variations too in point of colour are frequently observed to take place not only in different individuals of the same species, but even in similar parts of the same plant. Marvel of Peru and Sweet William produce flowers of different colour upon the same stalk. Objections equally valid lie against characteristical marks drawn from the taste and smell. The former varies in different individuals from differences of age, and even in the same individual at different times, according to the morbid or sound state of the organ. The latter is different in different subjects, and varies in each; nor are the effluvia sent forth from the same body always of equal intensity. In plants, taste is subject to continual variations from differences of climate, soil, and culture. Garlic in some climates, particularly in Greece, is said to lose its rankness; apples and pears, that grow naturally in the woods, are intolerably acid; celery and lettuce, which culture renders sweet and palatable, are in their wild uncultivated state bitter, disagreeable, and in some cases noxious.

These considerations are abundantly sufficient to show the imperfection of the ancient system of botany; and, indeed, considering the vague and uncertain marks by which the ancients distinguished one plant from another, we may rather wonder how such a science as botany came to have an existence among them, than that

they arrived at no greater perfection in it, or suffered it so soon to fall into oblivion.

SECT. III. *Of the different Botanical Systems from the time of Gesner to that of Linnaeus.*

THE insufficiency of the ancient botanical system being so fully shown in the last section, we think it needless to take much notice of the methods used by Tragus and his cotemporaries and followers. The virtues of plants being found an insufficient characteristic, succeeding botanists had taken in the root, stem, and leaves; but these being also found insufficient and variable, Gesner turned his eye to the flower and fruit, as being the most permanent and unchangeable parts of the plant. In proposing the parts of fructification, however, as the most proper for arranging plants, he communicated no hints respecting the choice of some of those parts in preference to others. Each particular organ of the flower and fruit furnishes sufficient variety to serve as the foundation of a method; but all of them are not equally proper for this purpose. Cesalpinus, the first follower of Gesner, made a mistake in his choice, and took his distinguishing characteristics only from the fruit. The parts of the flower, therefore, being employed by the first systematic writers only as subaltern distinctions in finding out orders and genera, it is evident that the plant could not be fully investigated for several months. Suppose a plant ripens its fruit in October, and does not produce flowers till the following May: the class, upon inspection of the fruit in the month of October, is immediately ascertained; but the plant still remains unknown, and will continue so upwards of six months after, if the characters of the order and genus have been made to depend on any part of the flower. Methods founded on the fruit have another inconvenience; plants constantly ripen their fruit in those countries where they grow naturally, but not always in the countries to which they may be accidentally transported. So far from this, many plants that are natives of a warm climate neither ripen nor form fruit in a cold one. Few of the African, Asiatic and West-Indian plants produce fruit in Britain. A method, therefore, founded upon the fruit, could only facilitate the knowledge of such plants to the inhabitants of those countries where they grow: to the English botanist they could be of little or no service. The same objection cannot reasonably be urged against methods founded on the flower, since the influence of climates much colder than that of Britain has not been able to destroy the faculty of producing flowers in many, perhaps in most, of the plants just mentioned.

Cesalpinus sets out with an ancient distinction of vegetables, from their duration, into trees and herbs. With the former he combines shrubs; with the latter, under-shrubs; and distributes his plants into the 15 following classes. 1. Trees with the germ (radicle or principle of life in the seed) on the point of the seed. 2. Trees with the germ on the base of the seed. 3. Herbs having one seed only. 4. Herbs having two seeds. 5. Herbs having four seeds. 6. Herbs having many seeds. 7. Herbs having one grain or kernel. 8. Herbs having one capsule. 9. Herbs having two capsules. 10. Herbs having fibrous roots. 11. Herbs having bulbous roots. 12. Herbs having succory or

endive-like flowers. 13. Herbs having common flowers. 14. Herbs having several follicles or seed-bags. 15. Herbs having neither flower nor seed.

The inconveniences of this method have been already pointed out pretty fully, and will evidently appear upon an attempt to refer any common plant to one of the 15 abovementioned classes. His sections, orders, or secondary divisions, are 47 in number, and depend upon a variety of parts and circumstances. The principal of these are, the disposition, situation, and figure, of the flowers; the nature of the seed-vessel, or cover of the seeds; the situation of the radicle in the seed; the number of seed-lobes, or seminal leaves; the disposition of the leaves, and colour of the flowers. The lactescence too, or milkiness, which is observed in the compound flowers with flat florets, is made a characteristic distinction, and discriminates the first order of the 12th class. Thus, in the first systematic arrangements, the characters of the classes only were borrowed from the parts of fructification; while those of the subaltern divisions were very numerous, and respected every part of the plant; but that such divisions might be perfect, they should be constituted, like the classes, from the modifications of a single part of the fructification.

The great object had in view by Morison, who comes next in order to Casalpini, was to investigate the order of nature, not to fabricate an easy method of arranging plants. Hence his system is devoid of uniformity, and clogged with a multiplicity of characters; his classes are frequently not sufficiently distinguished from one another, and the key of arrangement seems totally lost. He sets out with a division of plants, from their consistence, into lignous or woody, and herbaceous. He founds his system on the fruit, the corolla or blossoms, and the habit of the plants. His classes are as follow: 1. Trees. 2. Shrubs. 3. Under-shrubs. 4. Herbs climbing. 5. Herbs leguminous or papilionaceous. 6. Herbs podded. 7. Herbs tricapular or with three capsules. 8. Herbs with four or five capsules. 9. Herbs corymbiferous. 10. Herbs having a milky juice, or downy tops. 11. Herbs bulbiferous, as grasses. 12. Herbs umbelliferous. 13. Herbs having three kernels. 14. Herbs having helmet-shaped flowers. 15. Herbs having many capsules. 16. Herbs berry-bearing. 17. Herbs called *capillary plants*, as the fern kind. 18. Anomalous or irregular herbs.

Of these classes, the fourth and eight possess no genuine distinctive character; nor are the ninth and tenth classes sufficiently distinguished; the fifteenth class is not sufficiently distinguished from the eighth, nor the 16th from the fourth. His sections or secondary divisions, which are 128 in number, arise from the figure and substance of the fruit; the number of seeds, leaves, and petals; the figure of the root; the direction of the stem; the colour of the flowers; the place of growth; and, in one class, from the medicinal virtues of some of the plants that compose it.

In 1682, Ray proposed his method to the world, two years after the publication of Morison's, which served in some measure as its basis. It consisted originally of the following 25 classes: 1. Trees. 2. Shrubs. 3. Herbs imperfect. 4. Herbs having no flower. 5. Capillary plants. 6. Staminate herbs having only the stamina. 7. Those having one naked seed. 8. Umbelliferous herbs. 9. Verticillated, annular, or ring-

shaped ones. 10. Rough-leaved plants. 11. Stellated or star-shaped ones. 12. Apple-bearing herbs. 13. Berry-bearing herbs. 14. Herbs having many pods. 15. Monopetalous uniform, or regular herbs. 16. Monopetalous irregular, or having different forms. 17. Tetrapetalous, having large pods. 18. Tetrapetalous, having small pods. 19. Papilionaceous. 20. Pentapetalous herbs. 21. Comas. 22. Grasses. 23. Coralliferous plants. 24. Bulbous rooted plants. 25. Plants near akin to the bulb.

This method Ray carefully corrected and amended at different times; so that the plan of arrangement which now bears the name of that author, and was first published in 1700, is entirely different from what had appeared in 1682. It now consists of 35 classes. Their distinguishing marks are taken from the port or habit of the plants; their greater or less degree of perfection; their place of growth; the number of seed-lobes, or seminal leaves, petals, capsules, and seeds; the situation and disposition of the flowers, flower-cup, and leaves; the absence or presence of the buds, flower-cup, and petals; the subsistence of the leaves and fruit; and the dissimilarity of classing certain plants. They are as follow:

1. Submarine, or sea-plants. 2. Fungi. 3. Mosses. 4. Capillary plants. 5. Those without petals. 6. *Plani-petale*, those with compound flowers; semistrobilous, or half-florets. 7. Those with compound flowers radiated. 8. Those with compound flowers, strobilous, or with whole florets. 9. Plants with one seed. 10. Plants umbellated. 11. Those stellated or star-shaped. 12. Rough-leaved plants. 13. Plants verticillate or whorled. 14. Those with many seeds. 15. Apple-bearing herbs. 16. Berry-bearing herbs. 17. Those with many pods. 18. Monopetalous herbs. 19. Those with two and three petals. 20. Those with great and small, or long and short, pods. 21. Leguminous plants. 22. Pentapetalous ones. 23. Bulbous and bulbous-like plants. 24. Staminate ones, or those having only the stamina. 25. Anomalous plants, or those of an uncertain family. 26. The palms. 27. Trees without petals. 28. Trees with an umbilicated fruit. 29. Trees with fruit not umbilicated. 30. Trees with a dry fruit. 31. Trees with podded fruit. 32. Anomalous, or irregular trees.

The distinction into herbs and trees with which Ray's method sets out, acknowledges a different, though not more certain, principle than that of Casalpini and Morison. The former, in making this distinction, had an eye to the duration of the stem; the latter, to its consistence. Ray called in the buds as an auxiliary; and denominates trees, "all such plants as bear buds;" herbs, "such as bear none." But as, and this auxiliary there lies an unavailing objection; namely, that though all herbaceous plants, like without buds, all trees are not furnished with them; many of the largest trees in warm countries, and some shrubby plants in every country, being totally destitute of that feebly appearance which constitutes the existence of a bud. In other respects, it is evident that neither Mr Ray's plan nor execution is in any degree calculated to facilitate the knowledge of plants. In fact, it seems to have been Ray's great object, no less than Morison's, to collect as many natural classes as possible; and their being separately investigated, a multiplicity of characters and steps was necessarily required to connect them; and

hence the intricacy complained of in both these methods, which must always take place where the classes give rise to the connecting characters, and not the characters to the classes. The characters of the orders, or secondary divisions, in Ray's method, are no less multifarious than those of the classes. They respect the place of growth of plants; their qualities; the figure of the stem; the number, situation, substance, and division, of the leaves; the situation and disposition of the flowers and calyx; the number and regularity of the petals; with the number and figure of the fruit. In his improved method, Ray has adopted Tournefort's characters of the genera, wherever his plan would permit. His general History of Plants contains 18,655 species and varieties. The third volume, which was not published till 1704, and was designed as a supplement to the two former, contains the plants discovered by Tournefort in the Levant, and by Camelli at Luzon one of the Philippine islands. Ray's method was followed by Sir Hans Sloane, in his Natural History of Jamaica; by Petiver, in his British Herbal; by Dillenius, in his Synopsis of British plants; and by Martyn, in his Catalogue of plants that grow in the neighbourhood of Cambridge.

To Ray's original method succeeded that of Christopher Knaut, a German; which acknowledges the same principle, and is manifestly founded upon it. In his enumeration of the plants that grow round Hal in Saxony, published in 1687, he divides vegetables into 17 classes, which have for their basis the size and duration of plants, the presence or absence of the petals, the disposition of the flowers, the substance of the fruit, the number of capsules or seeds, the number and figure of the petals, and the presence, absence, or figure of the calyx. His classes are, 1. Herbs berry-bearing. 2. Monopetalous, or with one flower-leaf. 3. Tetrapetalous and regular, with four petals. 4. Tetrapetalous and irregular. 5. Pentapetalous, or with five petals. 6. Hexapetalous, or six petals. 7. Polypetalous, or many petals. 8. Multicapular, or many capsules. 9. Naked seeds. 10. Solid, or not downy. 11. Downy seeds. 12. Without petals. 13. Stameneous, without petals or calyx. 14. Imperceptible. 15. Imperfect. 16. Trees. 17. Shrubs.

The sections or subdivisions of the classes in Knaut's method are 62 in number; and arise from the figure of the stem and petals, the number of capsules and cells, their figure, the number of seeds and leaves, and situation of the flowers.

In 1696, a new method, proposed by Dr Herman professor of botany at Leyden, was published by Zumbach, who arranged according to it the plants contained in the public garden of Leyden. Rudbeckius the Younger, in a dissertation published the same year, on the fundamental knowledge of plants, adopted Herman's method with a few inconsiderable variations. The classes of Dr Herman are 25 in number. They are founded on the size and duration of the plants; the presence or absence of the petals and calyx; the number of capsules, cells, and naked seeds; the substance of the leaves and fruit; the form and consistence of the roots; the situation and disposition of the flowers, leaves, and calyx; and figure of the fruit. 1. Herbs having one naked seed and a simple flower. 2. Having one naked seed and a compound flower. 3. With two naked seeds, and stellated or star-shaped. 4. Two naked seeds, and

umbelliferous. 5. Four naked seeds, and rough leaves. 6. Four naked seeds, and verticillated or whorl-shaped. 7. With many naked seeds. 8. Having seed-vessels, bulbous and tricapsular. 9. Having one seed-vessel. 10. With two seed-vessels. 11. With three seed-vessels. 12. With four seed-vessels. 13. With five seed-vessels. 14. Podded, which are always tetrapetalous. 15. Leguminous and papilionaceous. 16. With many capsules. 17. Having fleshy fruit, berry-bearing. 18. With fleshy fruit, apple-bearing. 19. Without petals, but having a calyx. 20. Without petals, chaffy or stameneous. 21. Without petals, calyx, chaff, or stamina, *i. e.* a naked anthera, as the mosses. 22. Trees. Imperfect fructification, bearing catkins. 23. Trees with a fleshy fruit umbilicated. 24. Trees with a fleshy fruit not umbilicated. 25. Trees with a dry fruit.

The classes in Herman's method are subdivided into 82 sections or orders; which have for their basis the number of petals, seeds, capsules, and cells, the figure of the seeds and petals, and disposition of the flowers.

To the method of Dr Herman succeeded that of Dr Boerhaave, who succeeded to the botanical chair of Leyden in 1709. His method is that of Herman, blended with part of the systems of Tournefort and Ray; and contains the following classes. 1. Herbs submarine, or sea-plants. 2. Imperfect land-plants. 3. Capillary plants, or the fern kind. 4. Many naked seeds. 5. Four naked seeds, and verticillated. 6. Four naked seeds, and rough leaves. 7. Four naked seeds, and four petals. 8. Plants having one seed-vessel. 9. Two seed-vessels. 10. Three seed-vessels. 11. Four seed-vessels. 12. Five seed-vessels. 13. Many seed-vessels. 14. Two naked seeds, and umbelliferous. 15. Two naked seeds, and star-shaped. 16. One naked seed, and a simple flower. 17. One naked seed, and compound flowers semisofculous. 18. One naked seed, and compound flowers radiated. 19. One naked seed, and compound flowers corymbiferous. 20. One naked seed, and compound flowers sofculous. 21. Berry-bearing herbs. 22. Apple-bearing herbs. 23. Without petals. 24. One cotyledon, and having petals. 25. One cotyledon, and without petals. 26. Trees having one cotyledon. 27. Many podded. 28. Podded. 29. Tetrapetalous and cruciform. 30. Leguminous. 31. Having no petals. 32. Bearing catkins. 33. Monopetalous flowers. 34. Rosaceous flowers.

These 34 classes of Dr Boerhaave are subdivided into 104 sections, which have for their characters, the figure of the leaves, stem, calyx, petals, and seeds; the number of petals, seeds, and capsules; the substance of the leaves; the situation of the flowers, and their difference in point of sex. By this method, Dr Boerhaave arranged near 6000 plants, the produce of the botanical garden at Leyden, which he carefully superintended for the space of 20 years, and left to his successor Dr Adrien Royen, in a much more flourishing state than he himself had received it. His Index or Catalogue of the Leyden plants was published in octavo in 1710; and afterwards, with great additions, in quarto, in 1720. This last edition contains descriptions of 5650 plants; of which number upwards of two thirds had been introduced into the garden since the time of Herman, by his illustrious successor. Boerhaave's characters are derived from the habit or general appearance of plants combined with all the parts of fructification; 10

so that, as Linnæus very properly observes, he was the first who employed the calyx, stamina, and style, in determining the genus. About 17 new genera were established by this author; among others, the very splendid family of the protea and silver-tree, which, although partly described by Morison, had remained generally unknown till this period. His method was adopted by one Emfling, a German, in a treatise intitled *The first principles of Botany*, published in octavo at Wolfenbuttel, in 1748.

Hitherto all the botanists had been intent upon investigating the order of nature, rather than facilitating the arrangement of vegetables: therefore their methods were very intricate and perplexed; and their writings, however entertaining to the learned, could afford but very little instruction to the young botanist. In 1690, however, Augustus Quirinus Rivinus, a German, professor of Botany at Leipzig, relinquishing the pursuit of natural affinities, and convinced of the insufficiency of characteristic marks drawn only from the fruit, attached himself to the flower, which, he was sensible, would furnish characters no less numerous, permanent, and conspicuous, than those drawn from the fruit. The calyx, petals, stamina, and style or pistil, which constitute the flower, are sufficiently diversified in point of number, figure, proportion, and situation, to serve as the basis of a mode of arrangement; yet all are not equally proper for this purpose. Rivinus made use of the petals as the largest and most beautiful part, and that from which the flower itself is commonly characterized. His method consists of the following 18 classes, which have for their basis the perfection and disposition of the flowers, and regularity and number of the petals. 1. Regular monopetalous, or having one petal. 2. Dipetalous. 3. Tripetalous. 4. Tetrapetalous. 5. Pentapetalous. 6. Hexapetalous. 7. Polypetalous, or having many petals. 8. Irregular monopetalous. 9. Irregular dipetalous. 10. Irregular tripetalous. 11. Irregular tetrapetalous. 12. Irregular pentapetalous. 13. Irregular hexapetalous. 14. Irregular polypetalous. 15. Compound flowers of regular florets. 16. Compound flowers of regular and irregular florets. 17. Compound flowers of irregular florets only. 18. Incomplete, or imperfect plants.

As Rivinus set out with the professed design of imparting facility to botany, he judged very properly in divesting his method of all extraneous matter, and rendering it as simple and uniform as the nature of the science would admit. The distinction into herbs and trees had been adopted by every writer on plants since the time of Aristotle. Rendered in some measure favored by its antiquity, this distinction maintained a kind of importance to which it was by no means essentially intitled. Rivinus was the first who in this matter dared to think for himself. He was early sensible of the inconveniences to which those had submitted who employed it as a primary division; and therefore resolved at once to get rid of a distinction that is frequently uncertain, always destructive to uniformity, and in its nature repugnant to the genuine spirit of system, because totally unconnected with the parts of fructification. In the uniformity of its orders or secondary divisions, which are 91 in number, and acknowledge the fruit for their principle, Rivinus's method equals, perhaps exceeds, all that went before or succeeded it. Only three

classes of his method were published by Rivinus himself. These are the 11th, 14th, and 15th, which were offered to the public at different times, illustrated with very splendid figures. The method was corrected and published entire by Heucher, in a work intitled *Herbarium Wittenbergense*, printed in quarto at Wittenberg in 1711.

Several German authors have followed Rivinus's method, either wholly or in part, without offering any considerable amendment. The principal of these are, Koenig, in a work on vegetables, published at Basil in 1699; Welch, in his *Botanica*, printed at Leipzig in octavo, in 1697; G. Meinhart, in a catalogue of plants published in 1725; Krause, in a work intitled *Tentamen Botanicum*, published at Dresden in 1728, and afterwards reprinted with additions at Vienna in 1744; and Hecker, in a dissertation on botany published at Hal in Saxony, in 1734. To these may be added Hebenstreit, an ingenious botanist, who in a treatise on plants published at Leipzig in 1731, just before his famous African expedition, established general characters, which had hitherto been wanting in Rivinus's method.

The writers who have attempted to improve upon Rivinus's method are Bernard Rappius, Christopher Ludwig, and Christian Knaut. Rappius, in his *Flora Jenzis*, published at Frankfort in 1718, has arranged the 120 plants there described by a method partly Rivinus's, and partly his own. It consists of 17 classes, and sets out with the same divisions and subdivisions as that of Rivinus; with this difference, however, that, whereas in Rivinus's method all perfect flowers are divided into simple and compound, in Rappius the division of regular and irregular flowers precedes that just mentioned, and simple and compound flowers are made subdivisions of the regular flowers only.

Christopher Ludwig's method, which was published in 1737, and consists of 20 classes, differs but little from that of Rivinus. The author accompanied Hebenstreit on his expedition into Africa, and seems to have made plants his favourite study. The improvement, however, which he has made on Rivinus's plan, consists only in rendering it more universal, having enriched it with a multitude of genera collected from the works of Tournefort, Ray, Boerhaave, Dillenius, and other eminent botanists, whose general characters he has likewise adopted. His plan of arrangement has been followed by two succeeding writers; M. Wedel, in a botanical essay published in 1747; and three years after by M. Bochner, in his catalogue of the plants which grow in the garden of Leipzig.

The method of Christian Knaut is much more properly his own, and departs in a much greater degree from that of Rivinus than either of the two former. The regularity and number of the petals furnished the classical divisions in Rivinus's method; in that of Knaut, number takes place of regularity; so that it is very properly termed by Linnæus, "The system of Rivinus inverted." This method was published in 1706; and sets out with a division into flowers which have one petal, and such as have more than one. It consists of the 17 following classes. 1. Monopetalous uniform or regular. 2. Monopetalous difform or irregular. 3. Monopetalous compound uniform or regular. 4. Monopetalous compound difform or irregular. 5. Monopetalous compound uniform and difform together. 6. Dipetalous uniform.

uniform or regular. 7. Dipetalous difform or irregular. 8. Tripetalous uniform or regular. 9. Tripetalous difform or irregular. 10. Tetrapetalous uniform or regular. 11. Tetrapetalous difform or irregular. 12. Pentapetalous uniform or regular. 13. Pentapetalous difform or irregular. 14. Hexapetalous uniform or regular. 15. Hexapetalous difform or irregular. 16. Polypetalous uniform or regular. 17. Polypetalous difform or irregular.

The sections or secondary divisions in Knaut's method are 121, and depend upon the internal divisions of the fruit; and upon this his opinions are somewhat singular. Every kind of fruit, whether pulpy or membranaceous, is termed by our author a *capsule*. Neither is the term restricted to fruits properly so called: it is extended also to those termed by botanists *naked seeds*, the existence of which Knaut absolutely denies. Agreeable to this opinion, capsules, he says, with respect to their consistence or substance, are of two sorts; pulpy, or membranaceous. The former correspond to the fruits of the apple, berry, and cherry kind; the latter to the capsules properly so called, and naked seeds of other botanists. Again, with respect to their cells or internal divisions, capsules are either simple or compound. Simple capsules have an undivided cavity or a single cell; compound capsules are internally divided into two or more cells. With other botanists, the umbelliferous flowers bear two, the lip flowers four, naked seeds; according to Knaut, the former produce two, the latter four, simple capsules. Ranunculus, adonis, anemony, herb-bennet, and some other plants, have their flowers succeeded by a number of naked seeds collected into an aggregate or head; each of these seeds passes with Knaut for a simple capsule; so that the whole is an aggregate of several capsules with an undivided cavity or single cell. In numbering the cells or internal divisions of the pulpy fruits, our author has adopted a very singular method. Some fruits of the apple kind inclose a capsule that is divided into five membranaceous cells. It might then be very reasonably expected to find such fruits arranged with compound capsules of five cells; but, instead of this, the author whimsically enough combines in their arrangement the idea both of a simple and compound capsule. The pulpy part is undivided; in other words, it is a simple capsule furnished with one cell; the compound capsule inclosed contains five cells, which added to that of the pulp make the number six; and thus these kinds of fruits are arranged with those having capsules of six cells. By the same kind of reasoning, the fruit of the dogwood, which is of the cherry kind, and contains a stone with two cells or cavities, is placed by Knaut among compound capsules with three cells; the pulp passing for one division, and cavities of the stone or nut for the remaining two. This method of calculation is not the only singularity for which Knaut is remarkable. The essence of the flower is made by Ray, Tournefort, Rivinus, and most other botanists, to consist in the stamina and style. This position Knaut absolutely denies; and has established for a principle, that the flower is essentially constituted by the petals only. With him, the flower-cup, stamina, and style, are of little significance: their presence does not constitute a flower, if the petals are wanting; neither is their absence sufficient to destroy its existence, if the petals are present.

From this it follows, 1. That there can be no flowers without petals; and, 2. That the regularity or irregularity of the flower can never depend on the stamina and style, which are only occasionally present, and no-wise essential to its existence; both of which are evidently false to every botanical reader.

Since the time of Rivinus, no leading method in botany has appeared except that of Tournefort and Linnaeus. Tournefort sets out with reviving the distinction of plants into herbs and trees, which had been exploded by Rivinus. His system is founded on the regularity and figure of the petals, together with the two-fold situation of the receptacle of the flowers; his orders, on the pistillum or calyx. The classes are, 1. Herbs with simple flowers monopetalous, and bell-shaped. 2. Simple flowers monopetalous, tunnel and wheel-shaped. 3. Simple flowers monopetalous, labiated or lipped. 4. Simple flowers monopetalous, anomalous, or irregular. 5. Simple flowers polypetalous, cruciform or cross-shaped. 6. Simple flowers polypetalous, and rosaceous or like a rose. 7. Simple flowers polypetalous, unbellated. 8. Simple flowers polypetalous, caryophyllaceous, clove-form. 9. Simple flowers polypetalous, liliaceous or lily-form. 10. Simple flowers polypetalous, papilionaceous, or butterfly form. 11. Simple flowers polypetalous, anomalous or irregular. 12. Compound flowers, flosculous, tubular or whole florets. 13. Compound flowers semidisculous, flat or half florets. 14. Compound flowers radiated, like the spokes of a wheel. 15. Apetalous, having no petals. 16. No flower, but bearing seed. 17. No flower nor seed, in the vulgar estimation. 18. Trees with no petals, but bare stamina. 19. Trees with no petals bearing catkins. 20. Trees monopetalous. 21. Trees rosaceous. 22. Trees papilionaceous.

The secondary divisions in Tournefort's method, which are 122 in number, have obtained the name of *sections*. Their general distinctions are founded principally upon the fruit, as those of the classes are upon the flower.

Tournefort hath been followed by a vast number of botanical writers, of whom the most considerable are, Dr William Sherard, an eminent Botanist of the last and present centuries. In 1689, he published the first sketch of Tournefort's method, under the title of *Schola Botanicæ*; or a catalogue of the plants demonstrated by Dr Tournefort, in the royal garden at Paris. It was not till five years after, that the *Elementa Botanica*, a work which contains the rudiments and illustration of his method, was published by Tournefort himself.—Father Plumier, termed by way of eminence the *Tournefort of America*, published in 1703, at Paris, a description of American plants, which he has arranged according to the system of Tournefort. In this work he accurately characterized 96 new genera. Falugi, an Italian, has described, in pretty elegant Latin verse, all the genera of Tournefort, in a work intitled *Proprie Botanice*, published at Florence, 12mo, 1705. Several celebrated French academicians, particularly Marchant, Dodart, Nissole, Jussieu, and Vaillant, have also occasionally paid their tribute of acknowledgment to this author, from the year 1700 to 1740. The other authors of note who have followed Tournefort's method, are, M. Petit, an ingenious French botanist; Jöhren, a German, author of a treatise published at Colberg

Colberg in 1710, intitled *Floris mecum Botanicum, seu Ojezus Botanicus*; Feuille, in his description of the plants of Chili and Peru, published at Paris in quarto, 1714; Christopher Valentin, a German, author of a book intitled *Tournefortius Contractus*, published at Francfort, in folio, 1715; Ripa, an Italian, in a work intitled *Historia Universalis Plantarum Conscripta Propositum*, published in quarto, at Padua, in 1718; Michael Valentin, a German, in his *Viridarium Reformatum*, published in folio, at Francfort, in 1719; the celebrated Dillenius, professor of botany at Oxford, and author of several much esteemed publications on botany, particularly the *Hortus Elthamensis*, and History of Mosses, in his *Flora Giffensis*, printed at Francfort in 1719; Pontedera, an Italian, author of the delineation of a method which combines those of Tournefort and Rivinus, published at Padua, in his botanical dissertations, in 1720; Monti, an Italian, in a work published at Bologna in 1724, under the title of *Indices Plantarum Varii*; Lindeni, a German, in his *Tournefortius Alfacicus*, first published in 1728; Signior Micheli, author of several curious discoveries respecting mosses and mushrooms, in his *Nova Genera Plantarum*, published in folio at Florence in 1729; Elvehemes, a Swede, in a work published in the Swedish language at Upsal in 1730; Fabricius, a German, author of a work intitled *Primitia Florae Butijbacensis, seu sex Decades Plantarum Rariorum*, published in 1743; Sabbati, an Italian, in his catalogue of the plants that grow in the neighbourhood of Rome, printed at Rome in 1745; and the ingenious Dr Charles Allson, late professor of botany at Edinburgh, in his *Tyrocinium Botanicum*, published at Edinburgh in 1753.

Of all this numerous list of writers, Father Plumier and Pontedera alone have ventured to quit the tract pointed out by Tournefort. The former, in his arrangement of American plants, has relinquished the distinction into herbs and trees; but the latter has attempted more considerable variations. His classes are, 1. Uncertain. 2. Having no flowers. 3. Without buds, imperfect plants. 4. Anomalous or irregular. 5. Labiated. 6. Bell-shaped. 7. Saucer-shaped. 8. Wheel shaped. 9. Tunnel-shaped. 10. Flosculous. 11. Semilobosulous. 12. Radiated. 13. Irregular. 14. Papilionaceous. 15. Liliaceous. 16. Caryophyllaceous. 17. Cruciform, or cross-shaped. 18. Umbellated. 19. Staminous, or with naked stamina. 20. Bearing buds, apetalous, or without petals. 21. Bearing buds irregular. 22. Bearing buds bell-shaped. 23. Bearing buds wheel-shaped. 24. Bearing buds tunnel-shaped. 25. Bearing buds, papilionaceous. 26. Bearing buds, rosaceous.

Besides all these methods, there have been invented two others, founded upon the calyx. The first of these was the invention of Peter Magnol, a celebrated professor of botany at Montpellier, and published in 1720, five years after the author's death. The other was delineated by Linnæus, and published in his *Claves Plantarum* in 1738, three years after the publication of the sexual system. Magnol distinguishes two kinds of calyx; one external, which incloses and sustains the flower, and is the flower-cup properly so called; the other internal, which is the seed vessel or fruit. According to this idea, all plants, whether herbaceous or woody, are furnished with either the external calyx only, or with both. His classes are, 1. Herbs with the calyx

external, including a flower unknown. 2. Calyx external, including a flower staminate. 3. Calyx external, including a flower monopetalous. 4. Calyx external, including a flower polypetalous. 5. Calyx external, including a flower compound. 6. Calyx external, supporting a flower monopetalous. 7. Calyx external, supporting a flower polypetalous. 8. Calyx internal only, which is the corolla. 9. Calyx external and internal, flower monopetalous. 10. Calyx external and internal, flower with two and three petals. 11. Calyx external and internal, tetrapetalous. 12. Calyx external and internal, polypetalous. 13. Trees with the calyx external only. 14. Calyx internal only. 15. Calyx external and internal both.

The characters of the orders, or secondary divisions, in Magnol's method, are derived chiefly from the figure of the calyx, petals, and seeds; from the disposition of the flowers, from the number of petals, and substance of the fruit. Fifty-five sections or orders arise from the combination of these characters with those of the classes; and these are again subdivided into genera, which possess this singularity, that, in place of distinctive characters hitherto employed, they exhibit complete descriptions of all the parts of fructification of one or two species of each genus. From this improvement Linnæus manifestly borrowed the hint of his general characters.

Sir John Hill, in his vegetable system, endeavours to class plants according to their internal structure * Vol. I. "Perhaps (says he), upon the foundation of a true P. 130. anatomy of plants a natural method may be established: for it is certain, the forms of all the external parts of vegetables depend on the disposition of the internal; and all their differences are founded there. On the different inner structure of the vegetable body, under certain compass of its vessels, evidently depend the differences which characterize the seven first families, to the distinctions of which all classes are subordinate; and as these original distinctions are truly natural, we may here begin very safely.

"The seven families are these, 1. The mushrooms. 2. The algæ, or foliaceous sea and land plants. 3. The mosses. 4. The ferns. 5. The grasses. 6. The palms. 7. The common race of plants. Their distinctions one from another are these:

"1. The mushrooms are fleshy; and are destitute of leaves and visible flowers. 2. The algæ are merely foliaceous, the entire plant consisting of a leafy matter without other visible parts. 3. The mosses have processes of the inner rind for leaves. 4. The ferns consist of a single leaf raised on a stalk; and bear their flowers upon its back. 5. The grasses have jointed stalks and undivided leaves, and husks to hold the seeds. 6. The palms have a simple trunk, with leaves only on the top, and have the flowers and fruit in divided ears."

Lastly, the seventh class, which he calls the *common race of plants*, are such as have their roots, leaves, stalks, flowers, and fruits, distinct and obvious; and have not the characters of any of the other six families.

To this natural method his artificial one, consisting of 43 classes, and which takes up the whole of his voluminous work, is designed only as an index; but as this is universally allowed to be inferior to Linnæus's, though he pretends to improve that system, we think it needless to take any farther notice of it.

Besides the sexual system of Linnæus, which is now almost universally followed, he formed another, which, like that of Magnol, had the calyx for its basis; but greatly superior both in the idea and execution, being indeed singularly serviceable to the novice in botany, by familiarizing to him various appearances of an organ so important in its nature, and so diversified in its form, as the calyx is. The classes are, 1. Spathaceous, like a sheath or hose. 2. Glumose or chaffy. 3. Amentaceous, or catkins. 4. Umbellated. 5. Common calyx or flower-cup. 6. Double calyx. 7. Flowering; the petals and stamina inserted into the flower-cup. 8. Crowned, or crown-shaped, with a radius. 9. Irregular. 10. Difform, or different shapes. 11. Caducous, which fall off or shed their leaves. 12. Not caducous, uniform and monopetalous. 13. Not caducous, uniform and polypetalous. 14. Not caducous, difform and monopetalous. 15. Not caducous, difform and polypetalous. 16. Incomplete calyx. 17. Apetalous, or a bare calyx without petals. 18. Naked, or neither petal nor calyx.

Sect. IV. *Of the Method of reducing Plants to Classes, Orders, Genera, and Species, according to Linnæus's Sexual System.*

BEFORE proceeding to explain this system, it will be proper to make the reader acquainted with the principal outlines of a plant, as delineated by our author in his *Principia Botanica*.

A plant consists of Root, Trunk, Leaves, Props, Frustrification, and Inflorescence; to which may be added the Habit.

1. The ROOT consists of two parts, *viz.* the caudex and the radicle, distinguished according to shape, direction, duration, &c.

1. CAUDEX, or *stump*, is the body or knob of the root from which the trunk and branches ascend, and the fibrous roots descend; and in different plants is either solid, bulbous (placed under a bulb), or tuberos. Solid, as in trees, shrubs, and many of the herbs. Bulbous will be explained under *Hybernacle*.—Tuberos knobs are also solid and hard, containing one or more embryos or eyes. They are either only one knob, as turnip, carrot, &c. containing only one eye at the top; or consist of many knobs connected together by slender fibres, as in potatoes, jerusalem artichokes, &c. each containing many eyes dispersed over the surface: and are either pitted, when the eyes lie inward, as in potatoes, &c. or tuberculated, containing the eyes outward, as in jerusalem artichokes, &c. In tuberos knobs, the fibres or stringy parts issue from every part of the surface; which is an essential difference from bulbous knobs, where they are confined to the caudex of the bulb only, and are the true and genuine roots, the bulb itself being only a large bud under ground. Those tuberos knobs with only one eye, differ as to duration, but are in general biennial; those with many eyes are perennial; both seem to be produced by the nutriment of the stem like buds, and not by the fibrous roots, for the stem is first formed and becomes strong, and as it grows to maturity, the tuberos knobs increase.

2. RADICLE, a *little root*, is the stringy or fibrous part of the root, descending from the caudex: it is really the principal and essential part of every root, and

by which the nourishment is drawn from the earth for the support of the plant.

II. The TRUNK, which includes the branches, is that part which rises immediately from the caudex, and produceth the leaves, flowers, and fruit. It is either herbaceous, shrubby, or arborecent; and is distinguished according to its shape, substance, surface, &c. and admits of the following sorts.

1. CAULIS, a *stalk* or *stem*, is the main or universal trunk which elevates the leaves and fructification, and is applied to trees, shrubs, and herbs: It is denominated *simple* when it doth not divide, and *compound* when it is divided into branches.

2. CULMUS, a *straw* or *baulm*, is the proper trunk of grasses; and also elevates both the leaves and fructification: It is sometimes jointed, and sometimes not; it is also sometimes round, and sometimes angular.

3. SCAPUS, a *stalk*, is an herbaceous trunk, which elevates the fructification, but not the leaves; that is, it is a stalk proceeding immediately from the root, and terminated by the flowers, as in narcissus, hyacinth, &c.

4. STIPES, a *trunk*, used by Linnæus for the trunk of mushrooms: as also for that slender thread or footstalk which elevates the feathery or hairy down with which some seeds are furnished, and connects it with the seed.

III. The LEAVES are said by Linnæus to be the muscles or organs of motion of a plant; by others, the organs by which perspiration and inspiration are performed. They are defined as proceeding from the expansion of the vessels of the stalk, forming several ramifications like net-work, extended in length and breadth in a determinate manner, having the interstices filled up with a tender pulpy substance; and the external covering is supposed to be a continuation of the scarf skin of the stalk.

Leaves are either simple or compound; and are distinguished by their figure, situation, insertion, number, divisions, &c.

A *simple leaf*, is such as either adheres to the branch singly, or whose footstalk is terminated by a single simple expansion, not parted to the middle rib; and is determined by its shape, surface, and divisions.

A *compound leaf*, is such whose footstalk is furnished with several separate simple expansions; or, in other words, whose divisions extend to the middle rib, now called a *common petiole* or footstalk, supporting several lobes or little simple leaves, of which the compound leaf consists: they are distinguished by shape, &c. and the form by which they are attached to the common footstalk, as palmated, winged, feathered, &c. Sometimes leaves are twice or more compounded; which divisions admit of many modifications, and give rise to as great variety of terms. It may sometimes be difficult, at first sight, to know a common footstalk to a compound leaf, from a branch: but it may be observed, that a common footstalk, where it issues from the branch, is either flat or hollow on one side, and convex on the other; whereas branches are alike on both sides, whether round, flat, or angular: again, buds are never found at the angles formed by the lobes of a compound leaf with the footstalk, but at the angles formed by the footstalk of the whole compound leaf and the stem: and it may always certainly be distinguished by its falling off with the little leaves which it supports.

The

The manner or place in which leaves are attached to the plant, is called the *determination of leaves*; and is distinguished by several terms, according to number, disposition, insertion, figure, &c.

IV. The PROPS, *fulcræ*, a term used to express those external parts which strengthen, support, or defend the plants on which they are found, or serve to facilitate some necessary secretion; and are as follow:

1. PETIOLUS, the footstalk or support of a leaf.
2. PEDUNCULUS, the footstalk or support of a flower.
3. STIPULA, *haulm or husk*, a sort of scale or small leaf, stationed on moist plants (when present) on each side the base of the footstalk of leaves and flowers, at their first appearance, for the purpose of support: They are placed either single or double; and sometimes on the inside, as in the fig and mulberry; or on the outside, as in the birch, lime, and papilionaceous flowers: They are also either sitting, extended downwards, or sheathing along the stem, as in the plane tree. As to duration, they sometimes fall before the leaves, and sometimes are equally persistent: They often afford a good distinction for the species.
4. CIRRHUS, a *curl*, meaning a clasper or tendril, is the fine spiral string or fibre by which plants fasten themselves to some other body for support: They are sometimes placed opposite to the leaves; sometimes at the side of the footstalks of the leaves; sometimes they issue from the leaves themselves; and sometimes they put out roots, as in ivy, &c.
5. PUBES, a term applied to the hair, down, wool, beard, bristles, glands, and several other appearances on different parts of plants, serving the double purpose of defence and vessels of secretion.
6. ARMA, the defensive weapon of plants; as thorns, prickles, &c.
7. BRACTEÆ, *thin plates of metal*, are the floral leaves; and mean not only those leaves situated on the stalk nearest to the lower parts of the flower, but those which sometimes terminate the flower stalk; being composed of large bractæ, resembling a bush of hair, and are then called *bractæ comæse*, as in crown-imperial, lavender, and some species of sage.

V. The FRUCTIFICATION, or *mode of fruit-bearing*, consisting of the calyx, corolla, stamina, pistillum, pericarpium, femina, and receptaculum; which will be afterwards explained.

VI. The INFLORESCENCE, or mode by which flowers are joined to their several peduncles, whether common or partial.

A flower in the Sexual botany hath a very different signification from the same term of former writers; for if the antheræ and stigma be present, though the calyx, corolla, filaments of the stamina, and style of the pistillum be wanting, it is still a flower; and if all the parts are present, it is a complete flower. The seed also constitutes the fruit, whether there be a pericarpium or not.

Complete flowers are either simple or aggregate; *simple*, when no part of the fructification is common to many flowers or florets, but is confined to one only; *aggregate*, when the flower consists of many florets collected into a head by means of some part of the fructification common to them all, as by a common receptacle, or common calyx; as in dipacus, scabiosa, &c.

From the different structure, disposition, and other circumstances of the receptacle or calyx, being the

only common part to aggregate flowers, arise seven divisions.

1. AGGREGATE, properly so called, consisting of such flowers as are formed by the union of several lesser flowers or florets, placed on partial peduncles, on a common dilated receptacle, and within a common perianthium; and in those flowers where each floret hath its proper calyx, that is also a perianthium. [A flower is said to be *radiate*, when the florets in the radius or circumference differ from those in the disk; in which case they are generally larger, and are called *semi-florets*, from their difference in form, and in distinction from those of the disk, which are called *proper florets*; and they also differ as to sex, which gives rise to several of the orders in the class syngenesia, which contains the compound flowers.]

2. COMPOUND AGGREGATE, consisting also of several florets, placed sitting (or without partial peduncles) on a common dilated receptacle, and within a common perianthium; and where each floret hath its proper calyx, it is also a perianthium. Compound flowers also admit of a further description, viz. each floret consists of a single petal, with generally five divisions, and having five stamina distinct at the base, but united at the top by the antheræ into a cylinder, through which passeth the style of the pistillum, longer than the stamina, and crowned by a stigma with two divisions that are rolled backwards, and having a single seed placed upon the receptacle under each floret. This is the general character of a compound flower, to which there are a few exceptions; it also differs when the flower is radiate: but the essential character of a regular floret consists in the antheræ being united so as to form a cylinder, and having a single seed placed upon the receptacle under each floret.

3. UMBELLATE AGGREGATE, when the flower consists of many florets placed on sessile peduncles proceeding from the same stem or receptacle; and which, though of different lengths, rise to such a height as to form a regular head or umbel, whether flat, convex, or concave; and both the common and partial calyx Linnæus calls an *involutum*. It is called a *simple umbel*, when it hath no lesser divisions; a compound umbel, when each peduncle is subdivided at its extremity into many lesser peduncles for supporting the flowers, so as to form several little umbellas, uniting in one head; the whole together is called an *universal umbel*, and the little umbellas are called *partial umbels*. In some genera, that have radiated umbels, the florets of the center and those of the circumference, differ both as to sex and size; but in general each hath five petals, five stamina, and two styles, or one that is bifid, with a gemma placed beneath and two naked seeds, which when ripe, separate below, but remain connected at the top.

4. CYMOUS AGGREGATE (from *cyma*, a sprout) called by Linnæus a *receptacle*, is when several sessile peduncles proceed from the same centre like the umbel, and rise to nearly an even height; but unlike the umbel, the secondary or partial peduncles proceed without any regular order, as in sambucus, viburnum, &c.

5. AMENTACEOUS AGGREGATE, are such flowers as have a long common receptacle, along which are disposed squame or scales, which form that sort of calyx called an *amentum* or *catkin*, as in corylus, pinus, juglans, &c. Amentaceous flowers generally want the

petals, and all of them are of the classes monoecia and dioecia.

6. **GLUMOSE AGGREGATE**, are such flowers as proceed from a common husky calyx belonging to grasses, called *gluma*; many of which are placed on a common receptacle called *rachis*, collecting the florets into the spike, as triticum, hordeum, secale, lolium, &c.

7. **SPADICEOUS AGGREGATE**, are also such flowers as have a common receptacle, protruded from within a common calyx called *spatha*, along which are disposed several florets. Such a receptacle is called a *spadix*: and is either branched, as in phoenix; or simple, as in narcissus, &c.: In this last case the florets may be disposed, either all around it, as in calla, draconitium, pothos, &c.; on the lower side of it, as in arum, &c.; or in two sides, as in zosteria, &c. These flowers have generally no partial calyx.

These are the several distinctions of aggregate flowers (according to Linnæus); besides which there are several other modes of flowering, properly so called, that come under the general term *Inflorescence*, and often afford the best marks to discriminate the species. These modes of flowering are chiefly expressed as follows:

1. **VERTICILLUS**, a *whorl*, when the flowers are placed in whorls at each joint, round the common stalk: they have very short partial peduncles; are all of the labiated kind; and have either two or four stamina, and four naked seeds, as in salvia, marrubium, mentha, &c. A verticil hath several distinctions, as naked, bracted, &c.; and all those genera with four stamina are of the class didynamia.

2. **CAPITULUM**, a *little head*, is when many flowers are connected into nearly a globular form or head, on the summit of the common stalk, sometimes with and sometimes without partial peduncles, as in gomphrena, &c. and is distinguished by its shape and other circumstances.—Under *capitulum* is now introduced the term *fasciculus* (a little bundle), which in former editions stood distinct. It means when the peduncles are erect, parallel, approaching each other, and raised to the same height as in sweet William, where they generally proceed from different parts of the common stalk, opposite to each other.

SPICA, a *spike*, when the flowers, having no partial peduncles, are arranged alternately around a common simple peduncle. It is called *spica secunda* (a single-row'd spike), when the flowers are all turned one way, following each other; and *spica disticha* (a double-row'd spike), when the flowers stand pointing two ways, as in lolium, &c.: And it is distinguished by shape and other circumstances.

4. **CORYMBUS**, (a *cluster of ivy-berries*), when the lesser peduncles of the flowers proceed from different parts of the common peduncle or stalk; and though of unequal lengths, and sometimes simple, and sometimes branched, yet form a regular surface at the top; as in the siliquose plants (class *Tetradynamia*.) The corymbus may be supposed to be formed from a spike, by adding partial peduncles to the flowers; and seems to be the mean between racemus and umbella, the peduncles rising gradually from different parts of the common stalk, like those of the raceme, and proceed to a proportionable height like those of the umbel.

5. **THYRSUS** (a *young stalk*); a mode of flowering resembling the cone of a pine: Linnæus saith, it is a

panicle contracted into an ovate or egg-shaped form; the lower peduncles, which are longer, horizontally; and the upper, which are shorter, mount vertically, as syringa, &c.

6. **RACEMUS**, (a *bunch of grapes*), is when the flowers are placed on short partial peduncles, proceeding as little lateral branches, from and along the common peduncle. It resembles a spike in having the flowers placed along a common peduncle, but differs from it in having partial peduncles: it also differs from a corymbus in the shortness and equal length of its peduncles, not forming a regular surface at the top; as in ribes-rubrum, vitis, &c.

7. **PANICULA**, (the *tussock upon reeds*), is when the flowers are dispersed upon peduncles variously subdivided; or it is a sort of branching spike, composed of several smaller spikes, attached along a common peduncle, as in avena panicum, and several other grasses, and many other plants. When the partial peduncles diverge and hang loose, it is called a *diffuse*, and when they converge, it is called a *close*, *panicle*.

To these may be added the term **AXILLARES**, (from *axilla*, the arm-pit), being such flowers as proceed from the angle formed by the leaf and the stem, as is most common: And **TERMINALES**, being such flowers as terminate the stalk or branch. Also every other mode of flowering is called the *Inflorescence*, whether opposite to the leaves, lateral, single, double, erect, bending, &c.

Under this head of Inflorescence may be explained **LUXURIANT FLOWERS**, (commonly called *double-flowers*); which, as they are considered only as varieties and unnatural, belong properly to the head, Habit of plants. A luxuriant flower is supposed generally to be owing to superabundant nourishment; the luxuriant part is generally the corolla, but sometimes the calyx also. It is divided into three degrees: 1. *multiplicatus*; 2. *plenus*; 3. *prolifer*: To which may be added, as an opposite imperfection, *flor mutilatus*.

1. **MULTIPLICATUS**, when the petals of the corolla are only so far multiplied as to exclude part of the stamina; and is called *duplicate*, *triplicate*, *quadruplicate*, &c. according to the number of rows of petals.

2. **PLENUS**, when the corolla is so much multiplied, as to exclude all the stamina; which is occasioned by the stamina turning petals, and the flower is often so crowded as to exclude or choak the pistillum also. Therefore, as the essential parts of generation are thus wholly, or in part destroyed, the plants become barren and imperfect, and no seed, or very little, can be expected from them. Flowers with one petal are not very subject to fulness; when they are, it generally arises from an increase of the divisions of the petal. It is most usual in flowers of many petals, where it arises various ways; sometimes by multiplication of the petals only, sometimes of the calyx or nectarium, and sometimes of all. Compound flowers are also subject to luxuriance, arising several ways.

3. **PROLIFER**, when one flower grows out of another; this generally happens in full flowers, from their greater luxuriance. In simple flowers, it rises from the centre, and proceeds from the pistillum shooting up into another flower, standing on a single footstalk. In aggregate flowers (properly so called) many footstalked flowers are produced out of one common calyx. In

umbellate flowers, a second umbel proceeds from the centre of the first umbel, producing little umbels; which by a greater exertion of luxuriance may produce others with little umbels, and thus may proceed several heads of flowers, each growing out of that immediately below it, furnished with little umbels variously compounded. A prolific flower is also called *leafy* (frondosus), when it produceth branches with flowers and leaves, which, though rare, sometimes happens in rosa, anemone, monarda, and others. [As in luxuriant flowers many parts of the natural character are deficient in the whole or in part, they can only be distinguished by the general habit, and by such parts as remain in the natural state; as very often by the calyx, and in polypetalous flowers, the lowest series or rows of petals remain the same, as in rosa, papaver, nigella, &c.]

FLOS MUTILATUS, is such a flower as occasionally is deprived of all, or the greatest part, of the petals, yet bears seeds, as in some species of tussilago, campanula, &c. This term is opposed to luxuriance, and is supposed by Linnæus to be caused by a defect of heat, though it may also happen by other causes.

Under this head of flowers, may also be mentioned the different sexes.

FLOWERS, in respect to **SEX**, are distinguished into male, female, hermaphrodite, and neuter. Male flowers are such as have only the stamina or males, as in the classes monoecia, dioecia, and polygamia. Female flowers are such as have only the pistilla or females, as in the same classes monoecia, dioecia, and polygamia. Hermaphrodite flowers are such as have both the stamina and pistilla in the same flower, as in all the other classes; hermaphrodites are also distinguished into male hermaphrodites, when the female is ineffectual; and female hermaphrodites, when the male is ineffectual. Neuter flowers are such as have neither stamina nor pistilla perfect. The plants themselves also take a denomination from the sex of their flowers; as male plants are such as bear male flowers only; female plants are such as bear female flowers only; hermaphrodite plants are such as bear hermaphrodite flowers only. Androgynous (male and female) plants are such as bear both male and female flowers, distinct, upon the same root, as in the class monoecia. Polygamous plants are such as bear hermaphrodite flowers, and male or female flowers, or both distinct, on the same or on different roots: if on the same root, the flowers are either male hermaphrodites and female hermaphrodites; or hermaphrodites and male; or hermaphrodites and female, distinct: if on different roots, the flowers are either hermaphrodites and male; hermaphrodites and female; hermaphrodites and both male and female; or are androgynous and male; and sometimes androgynous and male and female on three distinct plants.

VII. The **HABIT** of plants, by which ancient botanists meant the whole external appearance of every part thereof, whereby they were arranged in their several systems; but by Linnæus it is meant to be the agreement of plants of the same genus or natural order; chiefly in the following circumstances.

Germination. The structure and disposition of the bulb, as solid, coated, leafy, stem-bulb. Also of the bud; its origin petioled, stipuled, cortical; its contents leafy, floral, common.

Vernation. The complication of the leaves within the bud, as conduplicate or doubled together, con-

lute or rolled together; involute or rolled in; revolute or rolled back; imbricated or tiled; equitant or rising; obvolvute or rolled against each other; plaited or folded over; spiral or coiled like a watch-spring, one end in the centre.

Effivation. The state of the bud in summer, as convolute, imbricated, conduplicate, valved, unequal-valved.

Tortion. The twisting or bending of the parts, as uniform, dissimilar, from the right, from the left, reciprocal, resupine, spiral.

Nuptials. Male, female, androgynous, hermaphrodite.

Semination. The shape and other circumstances of the seed, as tail, wing, tuft, awn, hooks, gluten, curvature. Also of the pericarpium; as berrying, inflation, viscosity, elasticity, structure.

Placentation. The number and disposition of the cotyledons; or if wanting.

Variation. Of colour, size, pubescence, age.

External: plaited, bundled, broad-leaved, curled, awnless.

Internal: mutilated, great-flowered, luxuriant, crested; viviparous, bulb-bearing.

By *variation* or *variety* are meant such differences as are only incidental to vegetables, and are not found constant and unchangeable; that is, where plants raised from the same seed, by some accidental cause differ in form and appearance, from the true character of the species to which they belong; which cause being removed, the plant is restored to its true specific character: and these incidental varieties chiefly arise by difference of soil or culture, in some of the above circumstances. And though it is as necessary to collect varieties under their proper species, as the species under their proper genera; yet it is often more difficult; first, from the difficulty of ascertaining the genus, and secondly, from the variety of confounding the species; and sometimes some parts of the specific character itself are also subject to variety, particularly the leaves; though in general the true specific character is constant and unchangeable, arising only from such circumstances wherein plants of the same genus are found to disagree, which distinctions are commonly taken with most certainty, from the following parts, (viz.) root, trunk, leaves, sulera, hybernacle, inflorescence: all which parts have been already explained, except hybernacle.

The **HYBERNACULUM**, (*winter's Abatement*), is that part of a plant which defends the embryo or future shoot from external injuries during the winter; and, according to Linnæus, is either a bulb or a bud.

I. A **BULB** (bulbus), is a large sort of bud produced under ground, placed upon the caudex of certain herbaceous plants, hence called *bulbosus* plants; all of which are perennial, that is, perpetuated by their bulbs or ground buds, as well as by seeds; they are therefore improperly called roots, being only the hybernacle of the future shoot. Bulbs are of the following sorts:

1. Squamous; consisting of scales laid over each other like tiles, as in the lily.

2. Solid; consisting of a close substance, as in tulips.

3. Coated; consisting of many coats unfolding each other, as in onions.

4. Cauline; produced not only from the sides of the principal bulb, called a *jack* or *shoot*, but from other parts of the stem; as in crow or wild garlic, and in some species of onion (hence called *bulbiferous*); where they are produced at the origin of the umbel of leaves.

II. A Bud (*gemma*), is the embryo of the plant, seated upon the stem and branches, covered with scales. In general there are three sorts of buds:—That containing the flower only, as in poplar, ash, &c. where the leaf-buds and flower-buds are distinct:—That containing the leaves only, as in birch, &c.:—and, That containing both flower and leaves, as in the generality of plants; and these last sometimes contain leaves and male flowers, sometimes leaves and female flowers, sometimes leaves and hermaphrodite flowers.

Annual plants are only renewed from seeds; and several other plants, both trees and shrubs, have no winter buds: It is also observed in hot countries, that few plants have buds; or at least they are without that scaly covering which seems essential to a bud, and constitutes the hybernacle; instead whereof are protruded small feather-like branches from the wings of the leaves, (defence and protection from cold not being necessary); whereas in cold countries most plants have buds, which are wrapped up all the winter, in readiness to greet the approaching spring.

Lastly, What is called the SLEEP of plants, according to Linnæus, happens various ways; as by converging, including, surrounding, fortifying, conduplicating, involving, diverging, depending, inverting, imbricating. This disposition in plants is very remarkable in chick-weed, pimpernel, dandelion, goat's-beard, &c. which

expand their flowers only at certain times of the day, and shut them up at the approach of night or a storm: which shows the great care nature takes to protect and invigorate her feeble offspring; and from hence may often be prognosticated a change of weather. In many plants, not only the flowers, but the young shoots, are defended from external injuries, by the nearest leaves converging and inclosing the tender rudiments.

The SEXUAL METHOD of reducing plants to classes, genera, and species, is founded upon the supposition that vegetables propagate their species in a manner similar to that of animals. Linnæus endeavours to support this hypothesis by the many analogies that subsist between plants and animals, which shall be more particularly pointed out in the next section. It is from this circumstance that Linnæus's system of botany has got the name of the *sexual system*. The names of his classes, orders, &c. are all derived from this theory. He calls the stamina of flowers, as we have seen, the *males*, or the male parts of generation; the pistils he calls *females*, or the female parts of generation; and plants whose flowers contain both male and female parts, are said to be *hermaphrodites*, &c. His classes, orders, and genera, are all derived from the number, situation, proportion, and other circumstances attending these parts, as will appear from the following

SCHEME of the SEXUAL SYSTEM, or TABLE of the CLASSES.

(Either *PUBLICLY*, *i. e.* have visible flowers:

{ *Monœcina*, males and females in the same bed;—*i. e.* The flowers are all hermaphrodite, having stamina and pistils in the same flower.

{ *Distincta*, the males or stamina unconnected with each other.

{ *Indifferentissimus*, the males or stamina having no determinate proportion betwixt each other as to length.

1. MONANDRIA, *i. e.* one male or stamen in a hermaphrodite flower.

2. DIANDRIA, — two males or stamina.

3. TRIANDRIA, — three males.

4. TETRANDRIA, — four males.

5. PENTANDRIA, — five males.

6. HEXANDRIA, — six males.

7. HEPTANDRIA, — seven males.

8. OCTANDRIA, — eight males.

9. ENNEANDRIA, — nine males.

10. DECANDRIA, — ten males.

11. DODECANDRIA, — eleven males.

12. ICOSANDRIA, — twenty, or more males inserted into the calyx, and not into the receptacle.

13. POLYANDRIA, — all above twenty males inserted into the receptacle.

{ *Subordinatio*, two of the males or stamina uniformly shorter than the rest.

14. DIDYNAMIA, — four males, two of them uniformly shorter than the other two.

15. TETRADYNAMIA, — six males, two of which are uniformly shorter than the rest.

{ *Affinitas*, the males or stamina either connected to each other, or to the pistillum.

16. MONODELPHIA, the males or stamina united into one body by the filaments.

17. DIADELPHIA, the stamina united into two bodies or bundles by the filaments.

18. POLYADELPHIA, the stamina united into three or more bundles by the filaments.

19. SYNGENESIA, the stamina united in a cylindrical form by the antheræ.

20. GYNANDRIA, the stamina inserted into the pistillum.

{ *Dislinia*, males and females in separate beds; *i. e.* plants that have male and female flowers in the same species.

21. MONOECIA, male and female flowers in the same plant.

22. DIOECIA, male flowers in one plant, and female: in another, of the same species.

23. POLYGAMIA, male, female, and hermaphrodite flowers in the same species.

(Or *CLANDESTINELY*, *i. e.* whose parts of fructification are invisible.

24. CRYPTOGAMIA, the flowers invisible, so that they cannot be ranked according to the parts of fructification.

PLANTS celebrate their nuptials

These 24 CLASSES comprehend every known genus and species. It is an easy matter to class a plant belonging to any of the first 11 classes, as they all depend on the number of stamina or male parts, without regard to any other circumstance: only it is to be observed, that the 11th class, *Dodecandria*, although its title is expressive of 12 stamina only, consists of such plants as are furnished with any number of stamina from 11 to 19 inclusive. The reason of the chasm in the classes from 10 to 12 stamina, is, that no flowers have yet been found with only 11, so as to form a class. *Refeda* hath sometimes only 11, but oftener more, yet never exceeding 15. The 12th class requires more attention than the preceding. When the stamina amount to above 20, a tyro will be apt to imagine that the plant belongs to the polyandria class. In reducing plants of this kind to their classes, particular regard must be had to the insertion of the stamina. If they are inserted into the calyx or cup, the plant belongs to the icofandria class; if to the receptacle or basis of the flower, it belongs to the polyandria. This distinction it is very necessary to observe, as the fruits of the latter class are frequently poisonous.

The 14th class is likewise in danger of being confounded with the 4th. In the 4th, the number of stamina is the same with that of the 14th: But in the 14th, two of the stamina are uniformly much shorter than the other two; at the same time each particular stamen belonging to the different pairs stands directly opposite to one another.

The 15th class may be mistaken for the 6th, as they consist of the same number of stamina. But in the 15th, four of the stamina are uniformly longer than the other two; and these two are always opposite to each other.

O R D E R S.

In the first 13 classes, the ORDERS, which are inferior divisions, and lead us a step nearer the genus, are taken from the pistils or female parts, in the same manner as the classes from the stamina: Monogynia, digynia, trigynia, tetragynia, &c. *i. e.* one, two, three, four, &c. female parts. When the pistils or female parts have no stalk or filament like the stamina, they are numbered by the stigmata or tops of the pistils, which in that case adhere to the capsule in the form of small protuberances, as may be observed in the flowers of the poppy, &c.

The Orders of the 14th class are derived from a different source. The plants belonging to it have their seeds either inclosed in a capsule, or altogether uncovered. Hence they naturally admit of a division into the following orders, *viz.* *gymnospermia*, comprehending such as have naked seeds; and *angiospermia*, which comprehends such as have their seeds covered, or inclosed in a capsule.

The 15th class is divided into two Orders, *viz.* the *siliclesta*, or those which have a short silique or pod; and the *siliquosa*, or those which have a longer silique.

The Orders of the 16th, 17th, 18th, and 20th classes, are taken from the number of stamina; *e. g.* monodelphia *pentandria*, *decandria*, *polyandria*, &c.

The 19th class consists of plants whose flowers are compounded of a great number of small flowers or floscules inclosed in one common calyx. The Orders of this class are,

Polygamia equalis, or such whose floscules are all furnished with stamina and pistils.

Polygamia spuria, comprehends those which have hermaphrodite floscules in the disk, and female floscules in the margin. This circumstance is made the foundation of the three following orders. 1. *Polygamia asperifera*, includes all those whose hermaphrodite flowers in the disk are furnished with stigmata, and bear seed; and whose female flowers in the radius likewise produce seeds. 2. *Polygamia frustranca*, include such as have hermaphrodite seed-bearing floscules in the disk; but whose floscules in the radius, having no stigmata, are barren. 3. *Polygamia nescitaria*, is the reverse of the former: the hermaphrodite flowers in the disk want stigmata, and are barren; but the female floscules in the radius are furnished with stigmata, and produce seeds.

Polygamia segregata, many floscules inclosed in one common calyx, and each of the floscules likewise furnished with a perianthium proper to itself.

Monogamia. This order consists only of seven genera, *viz.* the *Ilumpliia*, *scriphium*, *coymbium*, *jalsone*, *lobelia*, *viola*, and *impatiens*; none of which have properly compound flowers, but are ranked under this class purely from the circumstance of having their stamina united by the antheræ.

The Orders of the 21st class are partly taken from the number of stamina, and partly from the names and characters peculiar to some of the other classes; *e. g.* monœcia *triandria*, monœcia *syngenesia*, monœcia *gynandria*.

The Orders of the 22d class are founded upon the number, union, and situation of the stamina in the male flowers.

The Orders of the 23d are all taken from classical characters; *e. g.* *polygamia monœcia*, *polygamia diaœcia*, and *polygamia triœcia*.

The 24th class is divided into the four following Orders: 1. *Filices*, comprehending all plants that bear their seeds in the back or edges of the leaf, and those that are called *capillary plants*. 2. *Musci*, which comprehends all the moss kind. 3. *Algae*, including the lichens, fuci, and many others whose parts of fructification are either altogether invisible or exceedingly obscure. 4. *Fungi*, comprehending all the mushroom tribe.

TABLE OF THE ORDERS.

Orders.

CLASS I. consists of 2:	Monogynia, Digynia; comprehending 18 genera.
II. 3:	Monogynia, Digynia, Trigynia; 35 genera.
III. 3:	Monogynia, Digynia, Trigynia; 76 genera.
IV. 3:	Monogynia, Digynia, Tetragynia; 85 genera.
V. 6:	Monogynia, Digynia, Trigynia, Tetragynia, Pentagynia, Polygynia; 264 genera.
VI. 5:	Monogynia, Digynia, Trigynia, Tetragynia, Polygynia; 82 genera.
VII. 4:	Monogynia, Digynia, Tetragynia, Heptagynia; 7 genera.

		<i>Orders.</i>			
CLASS VIII. consists of 4:		Monogynia, Digynia, Trigynia, Tetragynia; 45 genera.	XXIII.	3:	Syngenesia, Gynandria; 55 genera.
IX.	3:	Monogynia, Trigynia, Hexagynia; 6 genera.	XXIV.	4:	Monœcia, Diœcia, Tricecia; 34 genera.
X.	5:	Monogynia, Digynia, Trigynia, Pentagynia, Decagynia; 94 genera.	APPENDIX, Palmæ.		
XI.	5:	Monogynia, Digynia, Trigynia, Pentagynia, Dodecagynia; 33 genera.	THESE last, though capable of being arranged in the several classes of the system, yet, on account of their singular structure, have been placed in an appendix, containing such genera as have a spadix and spathe, <i>i. e.</i> whose flowers and fruit are produced on that particular receptacle or seat called a <i>spadix</i> , protruded from a common calyx in form of a sheath called <i>spatha</i> . This order consists of trees and shrubs only. These have always a simple stem, not branched, bearing leaves at the top, resembling those of fern, being a composition of a leaf and a branch, called <i>frondes</i> ; and the corolla hath always three petals, or three deep divisions. The known genera are 10 in number.		
XII.	5:	Monogynia, Digynia, Trigynia, Pentagynia, Polygynia; 29 genera.			
XIII.	7:	Monogynia, Digynia, Trigynia, Tetragynia, Pentagynia, Hexagynia, Polygynia; 77 genera.			
XIV.	2:	Gymnospermia, Angiospermia; 102 genera.			
XV.	2:	Siliquosa, Siliculosa; 32 genera.			
XVI.	7:	Triandria, Pentandria, Octandria, Decandria, Endecandria, Dodecandria, Polyandria; 36 genera.			
XVII.	4:	Pentandria, Hexandria, Octandria, Decandria; 56 genera.			
XVIII.	3:	Pentandria, Icofandria, Polyandria; 12 genera.			
XIX.	6:	Polygamia æqualis, Polygamia superflua, Polygamia frustranea, Polygamia necessaria, Polygamia segregata, Monogamia; 116 genera.			
XX.	9:	Diandria, Triandria, Tetrandria, Pentandria, Hexandria, Octandria, Decandria, Dodecandria, Polyandria; 33 genera.			
XXI.	11:	Monandria, Diandria, Triandria, Tetrandria, Pentandria, Hexandria, Heptrandria, Polyandria, Monadelphia, Syngenesia, Gynandria; 80 genera.			
XXII.	14:	Monandria, Diandria, Triandria, Tetrandria, Pentandria, Hexandria, Octandria, Enneandria, Decandria, Dodecandria, Polyandria, Monadelphia,			

G E N E R A.

HAVING thus explained the distinctions of classes and orders, the next step is the investigation of the genus or family.

The essence of every vegetable, says Linnæus, consists in the fructification (or mode of fruit-bearing), and the essence of the fructification consists in the flower and fruit; the essence of the flower consists in the antheræ and stigma, and the essence of the fruit consists in the seed. Hence, in his sexual theory, he necessarily makes the flower and fruit the foundation of his generic distinctions. These are generally composed of several parts; the CALYX, the COROLLA, the STAMINA, the PISTILLUM, the PERICARPIUM, the SEMINA, the RECEPTACULUM; and the presence or absence, the number, figure, proportion, and situation of the several parts, constitute the genus. But as there are few genera wherein all the parts of the *natural* character are constant in every one of the species, it is necessary to fix upon such circumstances as are constant in both genus and species, and call those the *essential* or ruling character, as well the more easily to distinguish one genus from another, as to regulate and fix the several species and their varieties to their respective genera; for which purpose, in some cases, Linnæus was obliged to have recourse to the *nectarium*, afterwards explained. The first four parts of the fructification are properly parts of the flower, and the last three are parts of the fruit.

I. The CALYX (A), a *cup*, is the termination of the outer bark (*cortex*) of a plant. Its chief use is to inclose, support, and protect the other parts of the fructification. When present, it is seated on the receptacle:

(A) The calyx is considered a part of the flower, though it more generally attends, and is permanent with, the fruit, as in the class didynamia, and most other plants; yet sometimes it drops before or with the corolla, and before the fruit is ripe, as in the class tetradynamia, and many other plants. It is also considered a part of the flower, as there is no instance of its coming out after the plant has done flowering; yet in patagonula it is observed to grow to a much larger size in the fruit than it had in the flower: In some plants there is none, or scarce perceptible; in others, it is only a rim or border (*margo*). The germen is also considered as part of the flower, as being the base of the pistillum, though it afterwards becomes the seed-vessel.

ceptacle: and is distinguished by its figure; by the number, division, and shape of its leaves, or segments; and by the following names, according to the circumstances with which it is attended.

PERIANTHIUM, (*surrounding the flower*), when its station is close to, and furrounds the other parts of the fructification, and it is then called the *perianthium of the fructification*: If it includes many floscules, as in scabiosa, and other aggregate and compound flowers, it is called a *common perianthium*: if it includes only one floscule, in such flowers it is called a *proper perianthium*: if it includes the stamina, and not the germen, it is the perianthium of the *flower*, and is said to be *above*, as in lonicera, ribes, campanula, &c.: if it includes the germen, but not the stamina, it is the perianthium of the *fruit*, and is said to be *below*, as in linnea and morina, each of which have two calyxes and two receptacles above each other, one of the flower and the other of the fruit, and may therefore serve as instances in both cases.

INVOLUCEREM, (*a cover*), when stationed at the foot of an umbel, below the common receptacle, and at a distance from the flower: it is called *universal*, if placed under the universal umbel; and *partial*, if placed under a partial umbel.

AMENTUM, (*a thong*), meaning a *catkin*, when it consists of a great number of chafly scales, disposed along a slender axis or common receptacle, which, from its resemblance to a cat's tail, hath obtained the name *catkin*; and these flowers have generally no petals: Sometimes the same amentum supports both male and female flowers, distinct, on the same plant, as in carpinus, &c.; sometimes the male and female flowers are removed from each other on the same plant, and the amentum supports only the male flowers, and the female flowers are inclosed by a perianthium, as in corylus, juglans, fagus, &c.; and sometimes an amentum only supports male flowers on one plant, and female flowers on another plant, as salix, populus, &c.

SPATHA, (*a sheath*), being a sort of calyx growing from the stalk, bursting lengthways, and protruding a spadix or *receptacle*, supporting one or more flowers, which have often no perianthium; and consists either of one leaf, with a valve or opening on one side only, as in narcissus, galanthus, and the greater number of spathaceous plants; or of two leaves, with two valves or openings, as in stratiotes, &c.; or is imbricated, as in musa, &c. with one or two valves.

GLUMA, (*a husk*); this chiefly belongs to corn and grasses, consisting of one, two, three, or more valves, folding over each other like scales, and frequently terminated by a long, stiff, pointed prickle, called the *arista* (beard or awn).

CALYPIRA, (*a veil or covering*), the proper calyx to mosses; it is placed over the antheræ of the stamina, resembling an extinguisher, a hood, or monk's cowl.

VOLVA, from its *insliding* or *involving*, is the proper calyx to funguses, being membranaceous, and surrounding the stalk or pillar before their expansion.

[It is often difficult to distinguish the calyx from the bractæ, or floral leaves, which are found on many plants, situated on the flower-stalks; and are often so near to the lower parts of the fructification as to be confounded with, and mistaken for, the calyx, as in ulia, helleborus, passiflora, &c. (in helleborus the calyx

is wanting); but they may be best distinguished by this rule; the floral leaves differ in shape and colour from the other leaves of the plant, but are commonly of the same duration; whereas the calyx always withers when the fruit is ripe, if not before.]

II. The **COROLLA**, (*a wreath or little crown*), is the termination of the inner bark (*liber*) of the plant; which accompanies the fructification, in the form of leaves variously coloured: it is generally seated on the receptacle, sometimes on the calyx; serving as an inner work of defence to the part it incloses; as the calyx, which is usually of stronger texture, does for an outer work. The leaves of which the corolla are composed are called *petals*, by the number, division, and shape of which it is distinguished. It is said to be *below*, when it includes the germen, and is attached to the part immediately below it, as in salvia, borago, convolvulus, primula, &c.; and it is said to be *above*, when it is placed above the germen, as in lonicera, ribes, cratægus, &c. In respect to duration, the corolla either continues till the fruit is ripe, as in nymphæa; or falls off at the first opening of the flower, as in actæa, thalictrum; or falls off with the stamina and other parts of the flower, as in most plants; or does not fall, but withers, as in campanula, cucumis, and others.

There is also a part which Linnæus says principally belongs to the corolla, as an appendage to the petals; which he calls the *nectarium* (from nectar the fabled drink of the gods); and is that part containing the honey, which is the principal food of bees and other insects. But, though in such plants where it is found, it may more commonly be attached to the corolla, and be then most evident; yet it is almost as often attached to other parts of the fructification: Linnæus therefore chiefly makes use of it as an essential character in many of the genera, as being less variable than his other distinctions; and observes, that when it is distinct from the petals, that is, not united with their substance, those plants are generally poisonous: The tube or lower part of monopetalous flowers, he considers as a true nectarium, because it contains a sweet liquor. But as it affords very singular varieties in other instances, it hath obtained the following distinctions.

1. **CALYCINE NECTARIA**, such as are situated upon, and make a part of, the calyx; as in tropæolum, monotropa, &c.

2. **COROLLACEOUS NECTARIA**, such as are attached to the corolla. These are called *calcarate* (from *calcar*), when they resemble a spur or horn: which are either on flowers of one petal, as in valeriana, antirrhinum, &c.; or on flowers of many petals, as in orchis, delphinium, viola, fumaria, &c. O. the nectarium lies within the substance of the petals, as in fritillaria, lilius, berberis, iris, ranunculus, &c.

3. **STAMINEOUS NECTARIA**, such as attend the stamina, and are either seated upon the antheræ, as in adenantha; or upon the filaments, as in lamus, dictamnus, campanula, &c.

4. **PETALIACIOUS NECTARIA**, such as accompany the pistillum, and are placed upon the germen, as in hyacinthus, butomus, cleinanthus, heperis, &c.

5. **RECEPTACULOUS NECTARIA**, such as join to the receptacle, as in polygonum, sedum, sempervivum, &c.

6. **NECTARIA**, that crown the corolla, that is, when placed in a series or row within the petals, though entirely unconnected with their substance, as in *passiflora*, *lychnis*, *silene*, &c.; and in this situation it often resembles a cup, as in *narcissus*, &c.

7. **NECTARIA** of singular construction, being such as cannot properly be placed under any of the foregoing distinctions, as in *amomum*, *curcuma*, *salix*, *urtica*, &c.

The proper use of the nectarium, and why it should have such very different situations, is not yet known: but as it is found in most plants, there is great reason to believe it an essential part in the fructification, though not always perceptible.

III. The **STAMINA**, (*threads* or *chives*); the males of the flower, proceeding from the wood of the plant, each stamen consisting of two parts, viz. the filament and the antheræ. In most flowers they are placed upon the receptacle, within the corolla, and round the germen; and are chiefly distinguished by number.

The **FILAMENT** (from *filum*, a thread), is the thread-shaped part of the stamen, serving as a footstalk to elevate the antheræ, and is sometimes found to have jags or divisions (*laciniæ*); which are either two, as in *salvia*; three, as in *fumaria*; or nine, as in the class *diadelphia*. They are also distinguished by their form or figure, as awl-shaped, thread-shaped, hair-like, spiral, revolute, &c.: by their proportion, as equal, unequal, irregular, long, or short: and by their situation, being generally opposite to the leaves or divisions of the calyx, and alternate with the petals; that is, when the divisions of the calyx are equal in number to the petals, and to the stamina. In monopetalous flowers they are generally inserted into the corolla; but scarcely ever in flowers of more than one petal, but into the receptacle: Yet in the class *icofandria* they are inserted into the calyx or corolla (though the flowers have many petals), as also in a few other plants. But in the class *polyandria*, and most other polypetalous plants, they are inserted into the receptacle, like the calyx and corolla. The class *gynandria*, however, is an exception to the above rules, where the stamina are placed upon the pistillum, or female part of the flower; and are sometimes without filaments.

The **ANTHERA** (from *anthera*, a flower), emphatically so called from its great utility in the fructification, is the top or summit of the filament, containing the impregnating pollen or farina; and is either one to each filament, as in most plants; or one common to three filaments, as in *cucurbita*, &c.; or one common to five filaments, as in the whole class *syngenesia*: or sometimes there are two antheræ to each filament, as in *ranunculus* and *mercurialis*; three to each filament, as in *fumaria*; five to three filaments, as in *bryonia*; or five to each filament, as in *theobroma*. The anthera is also distinguished by its form or figure, as oblong, round, angular, &c. It also consists of one or more cells, which burst differently in different plants; either on the side, as in most plants; on the top; or from the top to the base. It is also fastened to the top of the filament, either by its base, as in most plants, or horizontally by its middle, to the top of the filament, so poised as to turn like a vane (*versatilis*): or it is fixed by its side, leaning to the top of the filament,

then called incumbent: or it sometimes grows to the nectarium, as in *coitus*; to the receptacle, as in *arum*; to the pistillum, as in the class *gynandria*.

IV. The **PISTILLUM**, or the female of the flower, proceeding from the pith of the plant. It is that erect column which is generally placed in the centre of the flower, amidst the stamina; and consists of three parts, the germen, the style, and the stigma.

1. **GERMEN** (a *bud*), is the base of the pistillum, supporting the style. After a process of nature, it becomes a seed-vessel, and may therefore be considered as the rudiment of the pericarpium. It is distinguished by its shape, number, and situation; and is said to be *above* or *below*, according to its situation above or below the attachment of the corolla.

2. The **STYLE** (from *stylus*, a pillar), is that part which elevates the stigma from the germen, in order to receive the influence of the stamina, and to convey the effects down to the germen as through a tube. It is distinguished either by its number, which, when present (or when absent, the number of stigmata), gives rise to most of the orders, and are called so many females; or by its divisions (*laciniæ*), being double, treble, or quadruple, &c. though joined at the base; or by its length, being longer, shorter, or equal with the stamina; or by its proportion, being thicker or thinner than the stamina; or by its figure, being angular, cylindrical, awl-shaped, bent, &c.; or by its situation, being generally on the top of the germen, tho' in some instances supposed to be both above and below, as in *exparris* and *euphorbia*; unless the lower part in these genera be considered as the extension of the receptacle: It is also often placed on the side of the germen, as in *hirtella*, *suriana*; also in *rosa*, *rubus*, and the rest of the plants in the class and order *icofandria polygynia*. With respect to duration, it generally falls with the other parts of the flower; but in some plants is permanent, and attends the fruit to its maturity, as in the class *tetradynamia*. In flowers which have no style, the stigma adheres to the germen.

3. The **STIGMA** (a *mark*), when single, is generally placed like a head on the summit of the style: when several, they are either placed on the top, or regularly disposed along the side; and covered with a moisture, to retain the pollen of the antheræ. It is distinguished either by its number, being single in most plants; by its divisions; by its figure or shape; by its length; by its thickness; and by its duration, as in most plants it withers when the germen is become a seed-vessel; in some it is permanent, as in *papaver*.

V. The **PERICARPIUM**, (*round the fruit*); the germen grown to maturity, and now become a matrix or seed-vessel. All plants, however, are not furnished with a seed-vessel, as in *corylus*, &c. In many, it is supplied chiefly by the calyx, which converging incloses the seeds till they arrive at maturity; as is the case with the rough leaved plants, and the labial and compound flowers of the several classes *pentandria*, *didynamia*, and *syngenesia*. Sometimes the receptacle supplies the office of seed-vessel, as in *gundelia*; and sometimes the nectarium, as in *carex*. The pericarpium is situated at the receptacle of the flower, either above or below, or both, as in *faxifraga* and *lobelia*; and is distinguished by the following appellations, according to its different structure.

1. **CAPSULA** (a *little chest* or *capsel*), which is frequently succulent whilst green; but when ripe, it is a dry husky seed-vessel, that cleaves or parts in some determinate manner to discharge its contents; and by some sort of elastic motion, the seeds are often darted forth with considerable velocity, as in distamus, &c. It opens also various ways; either at the top, as in most plants; at the bottom; at the side; horizontally across the middle; or longitudinally; and if it is articulated or jointed, it opens at each of the joints, which contains a single seed. It is further distinguished externally, by its number of valves; and internally, by the number of its cells or divisions, wherein the seed is inclosed; as also by its shape and substance.

2. **SILICUA** (a *pod*), which is a pericarpium of two valves; but as some are long, others round or broad. Linnaeus thought it necessary to distinguish them by their form into *siliqua* and *silicula*; which gives rise to the two orders in the class tetradynamia. The *siliqua* means a long pod, being much longer than broad, as in brassica, sinapis, &c.; the *silicula* (a little siliqua), is a roundish pod, either flat or spherical, and the length and breadth nearly equal, as in lunaria, draba, thlaspi, &c. In both, the apex, which had been the style, is often so long beyond the valves, as to be of equal length with the pod; and the seeds in both are fastened alternately by a slender thread, to both the futures or joinings of the valves.

3. **LEGUMEN** (*pulse*), is also a pod, and is likewise a pericarpium of two valves, wherein the seeds are fastened to short receptacles along the upper future only, on each side, alternate: this chiefly belongs to the papilionaceous or butterfly flowers of the class diadelphia.

4. **FOLLICULUS** (a *little bag*, in former editions called *conceptaculum*), is a pericarpium of one valve only, opening lengthwise on one side, and the seeds not fastened to the future, but to a receptacle within the fruit, as in apocynum, aselepias, &c.

5. **DRUPA** (from *drupes*, unripe olives), is a pericarpium that is succulent, or pulpy, having no valve or external opening. It contains within its substance a stone or nut; that is, a seed inclosed with an hard ligneous crust, as olea, cornus, juglans, prunus, amygdalus, &c.: and when the drupa is seated below the calyx, it is furnished with an umbilicus like the pomum.

6. **POMUM** (an *apple*), is also a pericarpium that is succulent or pulpy, and without valve; but containing in the middle a membranous capsule, with several cells or cavities containing the seeds; and at the end opposite to the footstalk there is generally a small cavity called *umbilicus* (the navel), from its resemblance to that part in animals, and which was formerly the calyx, seated above the fruit, and persistent, as in pyrus, cucumis, cucurbita, &c.

7. **BACCA** (a *berry*), is also a pulpy pericarpium without valve, inclosing one or more seeds, which have no membranous capsule or covering, but are disposed promiscuously through the pulp, as in solanum, &c. and are generally placed on footstalks attached to receptacles within the pulp, as in ribes, &c. The berry also admits of the following distinction: It is said to be *proper*, when it is a true pericarpium formed of a germen; and *improper*, when it is formed from other

parts of the fructification; as in morus, rosa, juniperus, taxus, &c. A large succulent calyx becomes a berry; and in juniperus the three petals become the umbilicus; in poterium the berry is formed of the tube of the corolla; in fragaria, &c. it is formed of the top of the receptacle; in tulus, &c. it is formed from a seed, which is the receptacle of the berry; in rufcus, &c. it is inclosed within and is a part of the nectary. The berry is commonly either round or oval, and is frequently furnished with an umbilicus, as in ribes, &c.: It does not naturally open to disperse the seeds like the capsule, that office being performed by birds and other animals.

8. **STROBILUS** (a *cone*), is a pericarpium formed of an amentum, being a seed-vessel composed of woody scales placed against each other in the form of a cone, opening only at the top of the scales, being firmly fixed below to a sort of axis or receptacle, occupying the middle of the cone; as in pinus, thuya, cupressus, &c.

VI. **SEMINA** (the *seeds*). A *seed* is the essence of the fruit of every vegetable; and is defined by Linnaeus to be "a deciduous part of the plant, containing the rudiments of a new vegetable, fertilized by the sprinkling of the pollen;" and they are distinguished according to number, shape, texture, appendage, &c. A seed, properly so called, consists of the five following parts; to which is added the nux and propago.

1. The **CORCULUM** (from *cor*, a heart), is the essence of the seed, and principle of the future plant; and consists of two parts, viz. plumula and rostellum. *Plumula* is the scaly part and essence of the corculum, which ascends and becomes the stem or trunk of the plant: it extends itself into the cavity of the lobes or cotyledons, and is terminated by a small sort of branch resembling a feather. *Rostellum* is the plain or simple part of the corculum, which descends into the earth, and becomes the root: its form is that of a small beak, placed without the lobes, and adhering internally to the plumula.

2. The **COTYLEDONS** (from *cotyledon*, the hollow of the huckle-bone), are the thick porous side-lobes of the seed, consisting of farinaceous matter, and which involve and for some time furnish nourishment to the embryo plant, but wither and die away when it becomes strong. If a plant be cut below the cotyledons, it will scarce ever put out fresh leaves, but withers and decays; if it is cut above the cotyledons, it generally shoots out afresh, and continues to grow: Therefore, if plants whose cotyledons rise above ground, as turnips, &c. be cut or eat to the ground by cattle, they decay; but where the cotyledons remain below ground, as in grasses, and are cut or eat to the ground, they will shoot out afresh. The cotyledons are also called the *seminal* or *seed* leaves: some plants have only one, as in grasses and in cuscuta, &c.; others two, as in vicia, &c.; linum hath four; cupressus hath five; and pinus, Linnaeus saith, hath ten. The cotyledons in mushrooms, ferns, and mosses, are not sufficiently ascertained to know if they have any.

3. The **MILUM** (the black spot on a bean, called the *eye*), is the external mark or scar on the seed, where it was fastened within the pericarpium.

4. The **ARILLUS**, a term used to express the proper exterior coat or covering of the seed; which falls off spontaneously, and is either cartilaginous or succulent:

lent: yet seeds are said to be *naked*, when not inclosed in any sort of pericarpium, as in the class and order didynamia gymnospermia.

5. The CORONULA, is either a little sort of calyx adhering to the top of the seed, like a little crown, and assisting to disperse it by flying, as in scabiosa, knautia, &c. where the little calyx of the floret becomes the crown of the seed: Or a down; which is either feathery, as in valeriana, leontodon, gnaphalium, &c.; or is hairy, as in tussilago, fenecio, hieracium, &c. [This down has generally been thought intended to disperse the seeds; yet as it frequently breaks off when those have flown to some distance. and is seen flying alone, some have imagined that the down is only intended as a defence of the seed till arrived at maturity.] —The coronula is also either sitting (*sessilis*), that is, attached close to the seed, as in hieracium, &c.; or footstalked (*stipitatus*), by a thread elevating and connecting the crown or tuft with the seed, as in lactuca, crepis, &c. Some seeds are also furnished with a wing, a tail, a hook, an awn, &c. all coming under the term *coronula*, and tending either to disperse or fix the several seeds to which they belong. Some seeds are also furnished with an elastic force, in order to disperse them; which is either in the calyx, as in oats and some others; in the pappus, as in centaurea-erupina; or in the capsule, as in geranium, fraxinella, spurting cucumber, &c. Other seeds, especially those whose pericarpium is a berry, as also the nutmeg and other nuts, are dispersed by birds and other animals.

Nux (*Nut*), a seed inclosed in an hard woody substance, called the *shell*, which is one-celled, two-celled, &c. and the inclosed seed is called the *kernel*.

PROPAGO. The seed of a moss, not coming under the above description, Linnæus calls *Propago* (a *slip* or *shoot*); which hath neither coat nor cotyledon, but consists only of a naked plumula where the rostellum is inserted into the calyx of the plant.

VII. The RECEPTACULUM is the base which receives, supports, and connects the other parts of the fructification; but it is only mentioned by Linnæus (in his *Gen. Pl.*) when it can be introduced as a character varying in shape and surface, as principally in the class syngeneia. It hath the following distinctions.

PROPER, when it supports the parts of a single fructification only: When it is a base to which only the parts of the flower are joined, and not the germen, it is called a *receptacle of the flower*; in which case, the germen being placed below the receptacle of the flower, hath a proper base of its own, which is called the *receptacle of the fruit*: And it is called a *receptacle of the seeds*, when it is a base to which the seeds are fastened within the pericarpium. In some simple flowers, where the germen is placed above the receptacle of the flower, the fruit hath a separate receptacle, as in magnolia, uvaria, &c. in which genera the numerous germina are seated upon a receptacle rising like a pillar above the receptacle of the fructification.

COMMON, when it supports and connects a head of flowers in common; as in the amentum, and other aggregate flowers.

UMBELLA, which Linnæus calls a *receptacle*. See aggregate flowers, under the head of INILORESCENCE, above, p. 427.

CYMA (a *sprout*), is also called a *receptacle*. *Ibid.*

RACHIS (the *back-bone*); a filiform receptacle, collecting the florets longitudinally into a spike, in many of the glumose flowers, as wheat, barley, rye, &c.

SPADIX, anciently only signified the receptacle of a palm (*phoenix*) issuing out of a spathe, and branched; but now every flower-stalk that is protruded from a calyx called *spatha*, is denominated a *spadix*, as in narcissus, &c.

When all these parts are understood, the genus may be easily investigated. But in order still further to assist the young botanist, we shall give a systematic description of a few common plants belonging to different classes. [The numbers refer to the figures in the subjoined *Explanation of the Plates*.]

DIANDRIA MONOGYNIA.

VERONICA, OR SPEEDWELL.

THE CALYX is a perianthium (18) divided into four parts or segments, and persistent (*i. e.* does not fall off till the seeds are ripe); the segments are sharp and lance-shaped.

THE COROLLA (11) consists of one rotated petal; the *tubus* (11) is about the same length with the calyx; the *limbus* (11) is plane, and divided into four oval segments, the lowest of which is narrower than the rest, and the one immediately opposite broader.

THE STAMINA (12) are two, narrower below, and inclined upwards: the antheræ (12) are oblong.

THE PISTILLUM (12) has a compressed germen (12), a filiform or thread-like stylus (12), about the same length with the stamina, and a little declined to one side: the stigma (12) is simple.

THE PERICARPIMUM (12) is a heart-shaped capsule, compressed at the top, and having two cells or partitions, and four valves.

THE SEEDS are roundish and numerous.

ICOSANDRIA POLYGAMIA.

FRAGARIA, OR STRAWBERRY.

THE CALYX is a perianthium consisting of one plain leaf, divided into ten segments, each alternately narrower.

THE COROLLA has five roundish open petals inserted into the calyx.

THE STAMINA are 20 in number, subulated or tapering, shorter than the corolla, and inserted into the calyx. The antheræ are lunulated, or shaped like a crescent.

THE PISTILLUM consists of many small germina collected into a little head or knob. The styli are simple, and inserted into the sides of their respective germina. The stigmata are simple.

THE PERICARPIMUM is wanting in this plant. But the common receptacle of the seeds, which supplies the place of a pericarpium, is a roundish oval berry, plain at the base, pretty large, soft, pulpy, coloured, and deciduous, *i. e.* falls off before the seeds be ripe.

THE SEEDS are small, pointed, very numerous, and dispersed through the superficial part of the receptacle.

DIDYNAMIA ANGIOSPERMIA.

DIGITALIS, OR FOX-GLOVE.

THE CALYX is a perianthium divided into four deep-

Parts of Fruition

deep-cut segments, which are roundish, sharp at the top, persistent, and the highest one is narrower than the rest.

The **COROLLA** consists of one bell-shaped petal; the tubus is large, open, ventricose or bellied at the back-side; the base is cylindrical and narrow: the limbus is small, and divided into four segments; the superior segment is more open and more emarginated than the rest.

The **STAMINA** are four, fubulated (44), inserted into the base of the corolla, and inclined to the same side; two of them are longer than the other two: the antheræ are divided into two parts, and pointed at the top.

The **PISTILLUM** consists of a germen sharp at the top, a simple style situated like the stamina, and an acute stigma.

The **PERICARPIMUM** has an oval capsule, of the same length with the calyx, sharp at the top, having two cells, and two valves which burst open at both sides.

The **SEEDS** are many and small.

TETRADYNAMIA SILIQUOSA.

SINAPIS, or MUSTARD.

The calyx is a perianthium consisting of four open or spreading leaves; the leaves are linear (43), concave, furrowed, disposed in the form of a cross, and deciduous.

The **COROLLA** consists of four cruciform petals: the petals are roundish, plain, open, entire or not emarginated, with erect linear unguis (13) scarcely so long as the calyx.

The **NECTARIA** (14, &c.), or *glandule nectariferæ*, are four, of an oval figure, one of which is situated on each side between the short stamina and stylus, and likewise one on each side between the long stamina and the calyx.

The **STAMINA** have six fubulated erect filaments, two of which are of the same length with the calyx, and always opposite to each other, and the other four are uniformly longer: the *antheræ* are erect, and sharp at the top.

The **PISTILLUM** has a cylindrical germen; the stylus is of the same length with the germen, and the same height with the stamina; the stigma is entire, with a little knob or button.

The **PERICARPIMUM** is an oblong, scabrous, double-celled, two-valved pod, gibbous, and full of little protuberances on the under parts: the dissepimentum (29) is large, compressed, and often twice the length of the valves.

The **SEEDS** are many and round.

MONODELPHIA POLYANDRIA.

MALVA, or COMMON MALLOW.

The **CALYX** is a double perianthium: the exterior one consists of three lanceolated, loose, persistent leaves; the interior has but one large, broad, persistent leaf, divided into five segments.

The **COROLLA** has five plain leaves united at the base, heart-shaped, and premorse, (54).

The **STAMINA** consist of numerous filaments, united into a cylindrical form below, loose above, and inserted into the corolla: the antheræ are kidney-shaped.

The **PISTILLUM** has an orbicular germen, a cylin-

dric short stylus, and many bristly stigmata of an equal length with the stylus.

The **PERICARPIMUM** consists of several distinct capsules joined by an articulation, resembling a depressed globe, and opening from within when ripe: the receptaculum is a kind of column binding the capsules together.

The **SEEDS** are solitary, and kidney-shaped.

SYNGENESIA POLYGAMIA-ÆQUALIS.

LEONTODON, or DANDELION.

The **common CALYX** is oblong, and imbricated: the *interior scales* are linear, parallel, equal, and open at the top; the *exterior scales* are fewer in number, and frequently reflected at the base.

The **compound COROLLA** is uniform and imbricated.

The *small hermaphrodite corolla* are very numerous and equal.

The *corolla* proper to each floscule consists of one ligulated (*i. e.* plain and expanded outwards), linear, truncated (*i. e.* terminated by a transverse line), and five-toothed petal.

The **STAMINA** consist of five very small capillary filaments: the antheræ are connected together, and form a cylindrical tube.

The **GERMEN** of the *pistillum* is situated below the proper corolla. The stylus is filiform, and nearly of the same length with the corolla: the stigmata are two, and turned back in a spiral form.

This plant has no *pericarpium*.

The **SEEDS** are solitary, oblong, rough, and terminated by a long pappous stipes (31).

The receptacle, or common base of the floscules (9), is naked, and full of small hollow points.

GYNANDRIA PENTANDRIA.

PASSIFLORA, or PASSION-FLOWER.

The **CALYX** is a perianthium consisting of five plain coloured leaves, similar to those of the corolla.

The **COROLLA** consists of five plain obtuse femi-lanceolated leaves, of the same magnitude and figure with those of the calyx.

The *nectarium* is a triple corona, the exterior of which is longest, surrounding the stylus within the petals, and flattened above.

The **STAMINA** are five, fubulated, open, and connected to the stylus at the base of the germen: the antheræ are oblong, obtuse, and incumbent.

The **PISTILLUM** consists of an erect cylindrical stylus, upon the top of which an oval germen is placed: the styli are three, thicker and wider above: the stigmata are roundish knobs.

The **PERICARPIMUM** is a fleshy, suboval, one-celled berry, resting upon the stylus.

The **SEEDS** are numerous, oval, and each of them inclosed in a small membrane.

MONOECIA TETRANDRIA.

URTICA, or COMMON NETTLE.

The **CALYX** of the male flowers is a four-leaved perianthium; the leaves are roundish, concave, and obtuse.

The **COROLLA** has no petals; but there is a small lanceolated

colated (*i. e.* an inflated skin, gibbous on each side) nectarium in the centre of the flower.

The STAMINA consist of four fabulated open filaments, of an equal length with the calyx, and one of them is placed between each leaf of the calyx: the *antheræ* have no cells.

The CALYX of the female flowers is a double-valved, oval, concave, erect, persistent, perianthium.

The COROLLA is wanting.

The PISTILLUM has an oval germen, no stylus, and a downy stigma.

They have no *pericarpium*.

The SEED is single, oval, thinning, and a little compressed.

S P E C I E S.

THE genera include a great number of relative species, distinguished by the specific difference of the root, the trunk, the branches, the leaves, &c. (yet all agreeing in the essential generic character); and are called by trivial names (expressive of the difference or some other circumstance) added to the generic name. In order to investigate the species, therefore, it is necessary to understand those differences, and be acquainted with the names by which they are expressed. Several of these have been already incidentally explained; but for a complete enumeration, the reader must have recourse to the nomenclature subjoined to this section. And to illustrate the manner in which those terms are used, we shall here give a few examples; referring, by numbers, to the figures on the plates.

Class II. DIANDRIA.

Order, MONOGYNIA.

Genus, VERONICA, or SPEEDWELL.

Species, *Veronica arvensis*, has solitary flowers; cut, sessile (130), and cordated (46), leaves.

Veronica agrestis, has solitary flowers; cut, cordated (46), and petiolated (129), leaves.

Class XVI. MONODELPHIA.

Order, POLYGYNIA.

Genus, MALVA, or MALLOW.

Species, *Malva spicata*, has tomentose (84), crenated (74), and cordated (46), leaves, and oblong hairy spicæ (34).

Malva sylvestris, has an erect (119) herbaceous stalk (148), with acute (74), seven-lobed (50) leaves, and hairy pedunculi and petioli (129).

Class XIX. SYNGENESIA.

Order, POLYGAMIA ÆQUALIS.

Genus, CARDUUS, or THISTLE.

Species, *Carduus helenioides*, or *melancholy thistle*, has lanceolated (42), toothed (66), amplexicaule (132) leaves; with unequal, ciliated (86), small spines (157).

Class XXIV. CRYPTOGAMIA.

Order, FILICES,

Genus, ASPLENIUM, or MAIDENHAIR.

Species, *Asplenium trichomanes*, has a pinnated (104) frons (144); the pinnae are roundish (38), and crenated (74).

To these examples we shall add a description of a plant, according to the *natural* character, from the *Genera Plantarum*; and according to the *essential* character, with the several species, from the *Systema Vegetabilium*, as translated by the Litchfield Society.

P A P A V E R, P O P P Y.

NATURAL CHARACTER.

CALYX. A perianthium two-leaved, ovate, end-nick'd; *leaflets* subovate, concave, obtuse, deciduous.

COROLLA. Petals four, roundish, flat, expanding, large, narrower at the base, less alternately.

STAMINA. Filaments numerous, capillary, much shorter than the corolla: *antheræ* oblong, compressed, erect, obtuse.

PISTILLUM. Germ. roundish, large; *stylus* none; *stigma* pellated, flat, radiated.

PERICARPIUM. A capsule crown'd with the large flat stigma, unilocular, semi-multi-unilocular, gaping at the top under the crown with many apertures.

SEMINA. Seeds, numerous, very small; *receptacles*, longitudinal folds, of equal number with the rays of the stigma adhering to the sides of the pericarpium.

ESSENTIAL CHARACTER.

PAPAVER. *Corolla* four-petal'd, *calyx* two-leaf'd, *capsule* one-cell'd, gaping with pores under the permanent stigma. *Poppy*.
* *With hispid capsules.*

1 P. HYBRIDUM. Capsules subglobular, brawny, hispid, stem leafy, many flower'd. *mule.*

2 P. ARGEMONE. Capsules club'd, hispid, stem leafy, many-flower'd.

3 P. ALPINUM. Capsules hispid, scape one-flower'd, naked, hispid, leaves twice-feather'd. *alpine.*

4 P. NUDICAULE. Capsules hispid, scape one-flower'd, naked, hispid, leaves simple, feather-sinuuous. *naked stem.*
* *With smooth capsules.*

5 P. RHOEAS. Capsules smooth, globular, stem hairy, many-flower'd, leaves feather-cleft, gash'd.

6 P. DUBIUM. Capsules oblong, smooth, stem many-flower'd, with bristles appress'd, leaves feather cleft, gash'd. *dubious.*

7 P. SOMNIFERUM. Calyxes and capsules smooth, leaves stem-clasping, gash'd. *semiferous.*

8 P. CAMERICUM. Capsules smooth, oblong, stem many-flower'd, polih'd, leaves feather'd, gash'd.

9 P. ORIENTALE. Capsules smooth, stem one-flower'd, rugged, leafy, leaves feather'd, saw'd. *oriental.*

Lastly, we shall subjoin a complete description of a plant reduced to its class, order, genus, and species, with figures of all the parts necessary for that purpose.

RHEUM

RHEUM PALMATUM, or *True Rhubarb*,

Plate CVII.

The flower of this plant has no CALYX.

The COROLLA, *M*, consists of one petal, narrower at the base, not perforated, and divided in the margin into six obtuse segments, one less and one larger alternately; the petal is mucrocent, *i. e.* decays, but does not fall off till the seeds be ripe.

The STAMINA, *ee*, consist of nine capillary filaments, inserted into the corolla, and about the same length with it. The *ant. ere* are didymous (*i. e.* appear to be double), oblong, and obtuse.

The PISTILLUM, *f*, has a short three-sided germen. It can hardly be said to have any styli; but has three reflected plumose stigmata.

The PERICARPIUM is wanting.

Each flower contains but one large, three-sided, acute SEED *g*, with a membranaceous edge.

The number of *Stamina* determines this plant to belong to the ENNEANDRIA Class; and the number of *Stigmata* fixes its Order to be TRIGYNIA. The other parts of the above description clearly demonstrate the genus to be the RHEUM or *Rhubarb*, and sufficiently distinguish it from the LAMUS, TIMUS, CASSYTA, and BUTOMUS, the only other genera belonging to this class.

The SPECIFIC mark is taken from the leaves, which are PALMATED (58), and sharp and tapering at the points. There are but five species of *Rheum*, none of whose leaves are *palmated*, except the species now described.

EXPLANATION of the PLATES.

PLATE CII. exhibits the 24 classes; fig. 1. representing the first class, or Monandria; fig. 2. the second class, or Diandria; fig. 3. the third class, or Triandria; and so on, according to the enumeration in the table. Plate CIII. represents the parts of a plant upon which the investigation of the GENUS depends.

Parts of the FLOWER.—Fig. 1. Spatha. Fig. 2. Spadix. Fig. 3. Gluma, or glume: *b b*, *arista*, or awn. Fig. 4. *Umbella* and *involucrum*: *a*, *Umbella univesalis*, or universal umbel; *b*, *partialis*, or partial umbel; *c*, *Involucrum univesale*, universal involucre; *d*, *partiale*, or partial involucre. Fig. 5. *Calyptra*: *a*, *capitulum*; *b*, *operculum*; parts of mosses. Fig. 6. Amentum. Fig. 7. Strobilus. Fig. 8. *a*, *Pileus*; *b*, *velva*; *c*, *stipes*: parts of fungi or mushrooms. Fig. 9. *a*, *Receptaculum commune nudum*, the common receptacle, or base of the flower, when the stamina, pistillum, capsule, &c. are taken off. Fig. 10. *Receptaculum commune paleis tuberculatum*, or common receptacle imbricated with palee or membranaceous lamelle. Fig. 11. *Corolla monopetalae*—*a*, *tubus*; *b*, *limbus*: *i. e.* *a* the tube, *b* the edge or margin, of a monopetalous corolla. Fig. 12. is a flower laid in a proper position for showing its different parts. *a*, *Germen*, which includes the seeds and capsule in which they are inclosed; *b*, *styla*, a continuation of the germen; *c*, *stigma*, or top of the styli; *d d d d d*, *filamenta*, or threads; *e e e e e*, *antherae*; *f f f f f*, *Petala*, or flower-leaves. Fig. 13. *a*, the *ungues* or *claws*, *b* the *limbi*, or plates, of a poly-petalous corolla. Fig. 14. *a*, *Nectarium campanulatum in narcejo*, or bell-shaped nectarium of the narcissus. Fig. 15. *Nectaria cornuta in osculis*, horned nectaria of the monkhood. Fig. 16. *Horned necta-*

rium in the calyx of the troptolus. Fig. 17. *a a a a*, *Nectarium in parnassia*; the nectaria of the parnassia grass are six in number, each of which have 13 styli, with round buttons or their tops.

Parts of the FERTILIZATION.—Fig. 18. *a*, *Perianthium*; *b*, *germen*; *c*, *styla*; *d*, *stigma*; *e e*, *filamenta*; *f f*, *antherae*, or anthers shedding the pollen or dust; *g*, *anthera in figura*, *i. e.* the appearance of the anthera before it sheds the pollen. Fig. 19. *a* the *stigma*, and *b* the *anthera*, separated from the flower. Fig. 20. *a*, one grain of the pollen magnified by a microscope; *b*, *calculus distans*, *i. e.* an elastic aura supposed to be necessary for impregnating the seeds. Fig. 21. *a*, *Germen*; *b*, *styla*; *c*, *stigma*. Fig. 22. *Pericarpium*: The seeds not adhering to the future, are inclosed in a particular receptacle *a*. Fig. 23. *a*, *Germen*, or a double-valved pericarpium, having the seeds fixed only to one of the futures *a a*. Fig. 24. *Albugo*, or a double-valved pericarpium with the seeds fixed to both futures or margins *a b*. Fig. 25. *Panicum*, or a singly pericarpium, containing a capsule in which the seeds are inclosed, as in the apple, &c.; *a*, the *pericarpium*; *b*, the *capsule* or seed case. Fig. 26. *a*, *Dryas*, or pericarpium containing a nut or stone, and having no valve. *b*, The *nut*, or stone. Fig. 27. *Bacca*, or berry, a pericarpium containing naked seeds dispersed through the pulpy part. Fig. 28. *Capsula apice demissa*, a capsule opening at the top to allow the seeds to fall out. Fig. 29. Four capsules inclosed in a common pericarpium. *a a*, The valves; *b b*, the dissepimentum, or partition which separates the different seed-capsules from one another; *c*, *columella*, or central column, by which the capsules are connected. Fig. 30. A capsule cut open longitudinally, to show the receptacle of the seeds. Fig. 31. *Pappus*, or down; *a*, *setula*, resembling hair; *b*, *plumosus*, or feathered; *c*, *semen*; *d*, *stipes*.

Pedunculi or *Footstalks* of FLOWERS.—Fig. 32. Corymbus. 33. Racemus. 34. Spica. 35. Verticillus. 36. Panicula.

PLATES CIV. CV. CVI. contain delineations relative to the SPECIES of plants.

1. LEAVES as to figure. *A*, *Singula*.—Fig. 37. *Orbitatum*, of a circular figure. Fig. 38. *Subrotundum*, roundish or nearly circular. Fig. 39. *Ovatum*, ovate. Fig. 40. *Ovale*, five *Ellipticum*, oval or elliptical. Fig. 41. *Oblongum*, oblong. Fig. 42. *Lanceolatum*, lanceolate. Fig. 43. *Lineare*, linear. Fig. 44. *Subulatum*, subulatum, or awl-shaped. Fig. 45. *Reniforme*, reniform, kidney-shaped. Fig. 46. *Cordatum*, cordate, heart-shaped. Fig. 47. *Imbricatum*, imbricated. Fig. 48. *Triangulare*, triangular. Fig. 49. *Sagittatum*, sagittated. Fig. 50. *Cordatum guttatum*, heart-shaped behind and sharp like the point of an arrow behind. Fig. 51. *Hystericum*, half-moon-shaped. Fig. 52. *Fidum*, notched. Fig. 53. *Trilobum*, trilobous, or having three (55) lobes. Fig. 54. *Præmorsum*, fore bitten. Fig. 55. *Lobatum*, lobed. Fig. 56. *Quinquangulare*, quinquangular. Fig. 57. *Erigeron*, eroded. Fig. 58. *Palmatum*, palmated. Fig. 59. *Pinnatum*, pinnated. Fig. 60. *Laciniatum*, lacinated. Fig. 61. *Sinuatum*, sinuated. Fig. 62. *Dentat. sinuatum*, tooth sinuated. Fig. 63. *Retrofractum*, sinuous backwards. Fig. 64. *Partitum*, partite. Fig. 65. *Riparium*, scolloid. Fig. 66. *Dentatum*, dented. Fig. 67. *Serratum*, serrated.

PLATE CIV
fig. 32—

Fig. 68. *Duplicato-ferratum*, doubly ferrated. Fig. 69. *Duplicato-crenatum*, doubly crenated. Fig. 70. *Cartilagineum*, cartilaginous. Fig. 71. *Acute-crenatum*, acutely crenated. Fig. 72. *Obtuse-crenatum*, obtusely crenated. Fig. 73. *Plicatum*, plaited. Fig. 74. *Crenatum*, crenated. Fig. 75. *Crispum*, curled. Fig. 76. *Obtulum*, obtuse. Fig. 77. *Acutum*, acute. Fig. 78. *Acuminatum*, acuminate. Fig. 79. *Obtusum cum acumine*, obtuse with a sharp point superadded. Fig. 80. *Emarginatum acule*, acutely emarginated. Fig. 81. *Cuneiforme emarginatum*, cuneiform and emarginated. Fig. 82. *Retusum*, retuse. Fig. 83. *Pilsum*, hairy. Fig. 84. *Tomentosum*, tomentose or downy. Fig. 85. *Hispidum*, bristly. Fig. 86. *Ciliatum*, ciliated, or fringed. Fig. 87. *Rugosum*, rugose or wrinkly. Fig. 88. *Venosum*, venose or veined. 89. *Nervosum*, nervose. Fig. 90. *Papillosum*, papillous. Fig. 91. *Linguiforme*, linguiform or tongue-shaped. Fig. 92. *Acinaciforme*, scimitar-shaped. 93. *Dolabriforme*, hatchet-shaped. Fig. 94. *Deltoides*, deltoid. Fig. 95. *Triquetrum*, triquetrous or prismatic. Fig. 96. *Canaliculatum*, channelled. Fig. 97. *Sulcatum*, sulcated. Fig. 98. *Teres*, cylindrical.—B. *Compound Leaves*. Fig. 99. *Binatum*, binate. Fig. 100. *Ternatum foliis petiolatis*, ternated with sessile feuilletts or leaflets. Fig. 101. *Ternatum foliis petiolatis*, ternated with petiolated feuilletts. Fig. 102. *Digitatum*, digitated or fingered. Fig. 103. *Pedatum*, pedated. Fig. 104. *Pinnatumcum impari*, pinnated with an odd feuillet. Fig. 105. *Pinnatum abrupte*, abruptly pinnated. Fig. 106. *Pinnatum alternatim*, pinnated alternately. Fig. 107. *Pinnatum interrupte*, abruptly pinnated. Fig. 108. *Pinnatum cirrhosum*, pinnated with a cirrhus. Fig. 109. *Pinnatum conjugatum*, pinnated with only two feuilletts. Fig. 110. *Pinnatum decursive*, pinnated decursively. Fig. 111. *Pinnatum articulata*, pinnated jointedly. Fig. 112. *Lyratum*, lyre-shaped. Fig. 113. *Biternatum*, or *duplicato-ternatum*, biternate (100), or double-ternate, or having three ternated (100) leaves upon one petiole. Fig. 114. *Bipinnatum*, or *duplicato pinnatum*, bipinnated, or double pinnated, *i. e.* having the primary *pinna* pinnated again a second time. Fig. 115. *Triternatum*, or *triplicato-ternatum*, triple ternated, or consisting of three biternated (113) leaves. Fig. 116. *Tripinnatum sine impari*, triple-pinnated without an odd feuillet, or having the secondary *pinna* pinnated again, and these last *pinnae* not terminated by an odd feuillet. Fig. 117. *Tripinnatum cum impari*, triple-pinnated with an odd feuillet.

2. *LEAVES*, as to determination.—Fig. 118. *Inflexum*, incurvated. Fig. 119. *Erectum*, erect. Fig. 120. *Patens*, patent or expanding. Fig. 121. *Horizontale*, horizontal. Fig. 122. *Reclinatum*, or *reflexum*, reclined or reflex. Fig. 123. *Revolutum*, revolute. Fig. 124. *Seminale*, feminal leaves, or seed leaves. Fig. 125. *Caulinum*, cauline or stem leaf. Fig. 126. *Ramosum*, a branch leaf. Fig. 127. *Florale*, floral; leaf next the flower; also termed a *bractea* or *spangle*. Fig. 128. *Peltatum*, peltated. Fig. 129. *Petiolatum*, petiolated. Fig. 130. *Sessile*, sessile or sitting. Fig. 131. *Decurrens*, decurrent. Fig. 132. *Amplexicaule*, amplexicaule. Fig. 133. *Perfoliatum*, perfoliate. Fig. 134. *Connatum*, connate. Fig. 135. *Vaginans*, sheathing. Fig. 136. *Articulatum*, articulated or jointed. Fig. 137. *Stellatum*, stellated, or verticillated. Fig. 138. *Quaterna*,

No 51.

quina, *sena*, &c. denote different species of stellated, or verticillated leaves, when there are four, five, six, &c. leaves in one verticillus or whirl. Fig. 139. *Opposita*, opposite. Fig. 140. *Alterna*, alternate. Fig. 141. *Acerosa*, linear and persifting. Fig. 142. *Imbricata*, imbricated, or tyled. Fig. 143. *Fasciculata*, fasciculated or penciled. Fig. 144. *Frons*, a species of stalk or trunk, consisting of branches and leaves, and sometimes the fructification, all united together; peculiar to the Filices or Ferns, and the Palmæ. Fig. 145. *Folium spatulatum*, (Saurv.) spatulated, or roundish above, with a long linear base. Fig. 146. *Folium parabolicum*, parabolic; having its longitudinal diameter longer than the transverse, and growing narrower from the base till it terminate somewhat like an oval.

3. *CAULS*, or *STEMS*.—Fig. 147. *Culmus squamosus*, a scaly culm or stalk. Fig. 148. *Caulis repens*, a reptent or creeping stalk or stem; appropriated to herbaceous plants. Fig. 149. *Scapus*, scape. Fig. 150. *Culmus articulatus*, a jointed culm (147) or stalk. Fig. 151. *Caulis volubilis*, a twining stem. Fig. 152. *Caulis dichotomus*, a dichotomous or two-forked stem. Fig. 153. *Caulis brachiatus*, brachiated.

4. *FULCRA* or *SUPPORTS*.—Fig. 154. a, *Cirrhus*, a clasper or tendril; b, *Stipula*, the little scales at the base of the petiole or foot-stalk of the leaf, or at the base of the peduncle or flower-stalk; c, *Glandulae concave*, small hollow glands for the secretion of some particular fluid. Fig. 155. a, *Glandule pedicellate*, small pedicellate glands. Fig. 156. a, *Bractea*, a spangle or flower-leaf, differing from the other leaves of the plant. Fig. 157. a, *Spina simplex*, a simple or one-pointed spine. b, *Spina triplex*, a triple or three-pointed spine. Fig. 158. *Aculeus simplex*, a simple or one-pointed prickle. Fig. 159. *Aculeus triplex*, a triple or three-pointed prickle. Fig. 160. *Folia opposita*, opposite leaves; a, the *axilla*, or angle betwixt the leaf and the stalk.

5. *ROOTS*.—Fig. 161. *Bulbus squamosus*, a scaly bulb. Fig. 162. *Bulbus solidus*, a solid bulb. Fig. 163. *Bulbus tunicatus*, a tunicated or coated bulb. Fig. 164. *Radix tuberosa*, a tuberous root. Fig. 165. *Radix fusiformis*, fusiform or spindle-shaped. Fig. 166. *Radix ramosa*, a branchy root. Fig. 167. *Radix repens*, a reptent or creeping root.

XXII. Terms applicable to the Fructification.

Under this are included,

- { 1. The calyx or cup.
 { 2. The corolla, or coloured part of the flower.
 { 3. The stamina, or chives.
 { 4. The pistillum.
 { 5. The pericarpium, or seed-case.
 { 6. The seed.
 { 7. The receptacle.

XXIII. Terms applicable to the Vernation.

XXIV. Additional Terms.

N^o I. *The PARTS of a PLANT are,*

- 1 The root, the organ that nourishes the plant.
- 2 The trunk or stalk, the organ that multiplies it.
- 3 The branches, or divisions and subdivisions of the stalk.
- 4 The petioles, or stalks that support the leaves (6).
- 5 The peduncles, or stalks that support the fructification.
- 6 The leaves, which are the organs of motion to the plant.

The FRUCTIFICATION, consisting of the Flower and the Fruit.

The Parts of a Flower are,

- 7 The cup, or outer rind of the plant, continued to and present in the fructification.
- 8 The corolla, or inner rind of the plant, continued to and present in the coloured part of the flower, fig. 11.
- 9 The stamina, or chives, the organs destined for the preparation of the pollen (332) or flower dust, fig. 18. f. f.
- 10 The pistil, or organ adhering to the fruit, for the reception of the pollen, f. 18. e. d.

The Parts of the Fruit are,

- 11 The pericarpium, or seed-case; the bowel or organ

containing the seeds (12), which, when ripe, it lets go, f. 23, 24, 28.

- 12 The seed, or rudiment of a new plant, supposed to be vivified by the irrigation or sprinkling of the pollen or flower-dust, f. 27.
- 13 The receptacle, or base with which the parts of the fructification are connected, f. 9, a.
- 14 The stipula, or small fealy leaf that usually stands at the base of the petioles when they are rising, fig. 154. b.
- 15 A cirrus, tendril, or spiral thread by which a plant is tied to any neighbouring body, fig. 154. a.
- 16 A bractea, spangle, or floral leaf, differing in its appearance from the other leaves of the plant, fig. 156. a a.
- 17 The pubes, the down or hairyness of any sort on plants.
- 18 Arms, the armour or sharp points that defend a plant from being hurt by animals.
- 19 A bulb, the winter habitation of a plant, consisting of the remains of its former leaves.
- 20 A gem or bud, consisting of the rudiments of the plant's future leaves.

GENERAL TERMS.

N^o II. *The DURATION of a Plant is either,*

- 21 Annual, or dying within one year.
- 22 Biennial, or flowering the second year, and then dying.
- 23 Perennial, or flourishing for many years.
- 24 Caducous, or falling down and dying before the end of one season.
- 25 Deciduous, dying at the end of one season.
- 26 Perishing, not dying after one season.
- 27 Sempervirent, evergreen, or remaining fresh and green through all the seasons of the year.

N^o III. *MAGNITUDE.*

“ I very seldom admit,” says Linnæus, “ any other than the proportional measure between the different parts of plants, where this or that part is longer or shorter, broader or narrower, than another.”
Phil. Bot. p. 262.

N^o IV. *SUBSTANCE is either,*

- 28 Solid, filled internally with hard matter.
- 29 Inane, filled only with spongy matter.
- 30 Pulpous, filled with tenacious or glutinous matter.
- 31 Carnous, or fleshy, filled with a hardish pulp.
- 32 Cartilaginous, consisting of gristly matter.
- 33 Membranaceous, consisting of dry and skinny matter.
- 34 Filulous, tubulated or hollow within.

N^o V. *DIVISION is either,*

- 35 Fissured, or divided by linear (70) notches, with straight (42) margins, f. 52.
- 36 Bisid, trisid, &c. to quinquesid, according to the number of fissures.
- 37 Partite, divided almost to the base.
- 38 Bipartite, tripartite, &c. to quinquepartite, according to the number of divisions.
- 39 Lobate, or lobed, divided down to the middle into parts standing asunder, fig. 55.

- 40 Sinuated, admitting of wide sinuses or notches on the sides, f. 61, 62, 63.
 41 Dichotomus, trichotomus, &c. divided successively into two, three, or more parts, fig. 152.

N^o VI. DIRECTION is either,

- 42 Right, or straight, free of bendings.
 43 Erect, rising nearly to a perpendicular, f. 119.
 44 Oblique, departing from a perpendicular, or horizontal line.
 45 Ascending, or turned archwise upward.
 46 Declining, or declined, turned archwise downward.
 47 Incurvated, turned archwise inward.
 48 Nutant, nodding, having the point turned outward.
 49 Reflex, having any part turned backward.
 50 Revolute (377) rolled back into a spiral line.
 51 Procumbent, weak and leaning on the ground.
 52 Flexuose, bent hither and thither.

The following terms respect chiefly the direction of branches (3).

- 53 Patent, expresses the direction of an acute angle.
 54 Diverging, parting at a right angle.
 55 Divaricated, expresses the direction of an obtuse angle.
 56 Dependent, looking straight to the ground.
 57 Ditich, or ditichated [flowers, leaves, or branches] turning to the two sides, though inserted all round.
 58 Sequent, turning all to one side.
 59 Apprest, approaching so as to be almost parallel to the stalk or trunk.
 60 Coarctate, almost incumbent towards the top.
 61 Diffuse, having small patent (53) branches.

N^o VII. FIGURE is that, either of Surfaces, or Solids, or Similitudes.

1. The figure of Surfaces is either,

- 62 Orbicular, of a circular form, f. 37.
 63 Subrotund, almost circular; and Subglobose, almost spherical, fig. 38.
 64 Ovate, having its longitudinal diameter longer than the transverse, with the base terminated by a segment of a circle, and the top narrower, f. 39.
 65 Parabolical, resembling a parabola.
 66 Elliptical, resembling an ellipse or oval, f. 40.
 67 Cuneiform, wedge-shaped, growing by degrees narrower toward the base.
 68 Oblong, having the longitudinal diameter any number of times longer than the transverse diameter, f. 41.
 69 Lanceolate, oblong (68), and attenuated (75) on either end, f. 42.
 70 Linear, everywhere of equal breadth, f. 43.
 71 Triangular, quadrangular, &c. according to the number of angles, f. 48.
 72 Rhombeous, or rhomboidal, of the shape of a rhombus.
 73 Trapeziform, of the shape of a trapezium.

2. The figure of Solids is either,

- 74 Filiform, everywhere of equal thickness.
 75 Attenuated, gradually losing its thickness towards the point.

76 Subulated, awl-shaped; linear, but attenuated towards the point.

77 Clavated, club shaped, growing thicker towards the point or top.

78 Turbinate, top-shaped like an inverted cone.

79 Globose, globular, like a sphere.

80 Conical, resembling a cone.

81 Teres, round, like a cylinder, f. 98.

82 Semiteres, half round, semicylindrical.

83 Anceps, two-edged, having the two opposite angles acute.

84 Trigonous, tetragonous, &c. having three, four, &c. prominent longitudinal angles.

85 Triquetrous, having three exactly plain sides (109).

86 Gibbous, or gibbose, having both upper and under surface convex, by reason of a more copious pulp (30) intervening.

87 Compressed pulpous (30), having the edges flatter than the disk or middle.

88 Depressed pulpous, having the disk flatter than the edges.

89 Lingulated, tongue-shaped; linear (70), carnos (31), convex (112), below.

90 Eniform, sword-shaped, ancipitous (83), gradually attenuated, or tapering from the base to the top.

91 Acinaciform, sabre shaped, compressed (87), carnos, having the one edge convex and thin, and the other straighter and thicker, fig. 92.

92 Dolabriform, hatchet-shaped, compressed, subrotund (63), gibbous on the outside (86), with the edge sharp, and roundish below, f. 93.

The tubulated figures that are mostly applied to the corolla, are,

93 Infundibuliform, funnel-shaped, an inverted cone placed upon a tube.

94 Campanulated, bell-shaped, ventricose (107), without any tube.

95 Inflated, hollow, and as it were blown up like a bladder.

96 Rotated, wheel-shaped, plain, and not placed on a tube.

3. The figure of Similitudes is either,

97 Cordate, heart-shaped, subovate, having a notch cut out of the base, without any posterior angles, f. 46.

98 Reniform, kidney-shaped, subrotund (63), having a notch cut out of the base, without posterior angles, f. 45.

99 Lunular, crescent-shaped, subrotund, having the base notched, with acute posterior angles, f. 47.

100 Sagittated, arrow-shaped, triangular (71), having acute posterior angles separated by a notch, f. 49, 50.

101 Hallated, halberd-shaped, sagittated (100), having the posterior angles divided by a blunt notch, and prominent towards the sides, f. 51.

102 Lyrated, lyre-shaped, divided across into lacinae, or segments of no determinate form, whereof the under ones are lesser and more remote from one another than the upper ones, f. 112.

103 Runcinated, pinnatifid (*i. e.* divided across into horizontal oblong segments), in such sort that the segments are convex on the fore-side and transverse behind, *e.g.* the dandelion.

- 104 Panduriform, pandour-shaped, oblong, and contracted or narrowed below.
 105 Spathulated, subrotund or roundish, with a linear and narrower base.
 106 Palmated, divided past the middle into lobes nearly equal, f. 58.
 107 Ventricose, gibbous or swelling out on the sides.
 108 Deltoid, rhomboidal (72), consisting of four angles, of which the lateral ones are less distant from the base than the other two; as the leaves of the black poplar. See also the figure of the ancient *delta* of the Greeks.

N^o VIII. EXPANSION is either,

- 109 Plain, having an equal surface.
 110 Canaliculated, hollowed above with a deep longitudinal furrow, f. 96.
 111 Concave, by the margin being less in proportion than the disk, and the disk of course depressed or pushed downwards.
 112 Convex, by the margin being less in proportion than the disk, so that the disk is elevated or pushed upwards.
 113 Cucullated, cowl-shaped, having the edges folded or curling inwards at the base, and spreading at the top like a cowl.
 114 Undated, waved, having the disk alternately bending up and down in obtuse plaits.
 115 Crisped, curled, by having the margin so luxuriant that the disk becomes longer than its rachis (283) or quill.

N^o IX. PLACE.

1. A Leaf is either,

- 116 Radical, growing out of the root.
 117 Cauline, growing on the caulis (197) or stalk, f. 125.
 118 Ramous, growing on a branch, f. 126.
 119 Axillary, placed under the base of a branch.
 120 Floral, next the flower. See Def. 16. f. 127.

2. A *Stipula*, or *scale*, is either,

- 121 Lateral, inserted into the side of a petiole.
 122 Extrafoliaceous, placed below a leaf.
 123 Intrafoliaceous, placed above a leaf.
 124 Oppositifolious, placed on the side of the stalk opposite to a leaf.

3. A *Cirrus*, or *tendril*, is either,

- 125 Pctiolar, growing out of a petiole or leaf-stalk.
 126 Peduncular, growing out of a peduncle or flower-stalk, &c. &c.

N^o X. The SITUATION of the Parts of a Plant is either,

- 127 Opposite, when the leaves, &c. are placed in decussated (129) or cross pairs, f. 114, 116.
 128 Alternate, growing all round a stalk or branch one after another gradually, f. 140.
 129 Decussated, placed opposite in such a manner, that if one look down from the top of the plant, the leaves, &c. represent four distinct rows.
 130 Verticillated, whirled; leaves, flowers, &c. surrounding the stalk or trunk at the joints in great number like a whirl, f. 35.

- 131 Bifarious, leaves, &c. growing only on the opposite sides of a stalk or branch.
 132 Sparse, placed without any certain order.
 133 Fasciculated, pencilled, growing in numbers out of the same point like a pencil, f. 143.
 134 Confert, close-ranged, leaves, &c. almost covering the whole surface.
 135 Distant, parts remote from one another.
 136 Terminal, placed at the top.

N^o XI. A SURFACE is either,

- 137 Naked, destitute of setæ (245) or bristles, and pili (240) or hairs.
 138 Levigated, smooth, of an equal plainness. The same with plain (109).
 139 Glabrous, of a slippery nature.
 140 Nitid, slippery and shining.
 141 Lucid, as if it were illuminated.
 142 Coloured, of a colour different from green (when that is the natural colour).
 143 Lineated, lined, the nerves being depressed.
 144 Striated, gently furrowed in parallel lines.
 145 Suleated, furrowed in deep lines, f. 97.
 a. Alveolated, honey-combed, a receptacle deeply pitted so as to resemble a honey-comb.
 b. Hilpid, any surface planted with stiff short hairs, f. 85.
 c. Rimose, full of rents or chinks.

[The following terms, to 156, belong chiefly to Leaves.]

- 146 Nervous, having unconnected small vessels, resembling nerves, running from the base to the top, f. 89.
 147 Trinerved, having three small nerves meeting at the base.
 148 Triplinerved, having three nerves meeting above the base.
 149 Trinervated, having three nerves meeting below the base.
 150 *Enervis*, nerveless, the opposite to nervous.
 151 Venous, having veins or small vessels divided variously, without any regular order.
 152 *Avenis*, veinless, the opposite to venous.
 153 Rugose, wrinkled, full of wrinkles, f. 87.
 154 Bullated, having the surface, from being rugose, raised up in the form of bubbles, by the veins being contracted, the other side by that means becoming concave.
 155 Lacunous, pitted, by the disk being depressed between the interspersed veins.
 156 Punctated, besprinkled with hollow points.
 157 Papillous, covered with carnos or fleshy points, f. 90.
 158 Papulous, covered with vesicular or bladder-like points.
 159 Viscid, besmeared with a gluey mixture.
 160 Tomentose, covered with fine down interwoven together, hardly to be discerned, f. 84.
 161 Villous, covered with soft hairs. See *Villi* (241).
 162 Sericeous, silky, covered with very fine hairs laid close down.
 163 Lanated, woolly, covered as it were with a cobweb (or spontaneously curled hairs). See *Lana* (242).
 164 Pilose, hairy, covered with long distinct hairs. See *Pili* (240), and f. 83.

- 165 Bearded, covered with parallel hairs. See *Barba* (243).
 166 Setaceous, bristly, set or covered with bristles. See *Seta* (245).
 167 Scabrous, having hard prominent points causing a roughness to the touch.
 168 Aculeated, armed with prickles fixed only to the bark. See *Aculei* (253).
 169 Strigose, having stiff lanceolated (69) prickles. See *Striga* (244).
 170 Paleaceous, chaffy, covered with dry scales resembling chaff. See *Palea* (246).
 171 Muricated, besprinkled with subulated points.
 172 Spinous, thorny, beset with spines, or prickles rising out of the wood of the plane.
 173 Burning, beset with stimulating and inflaming points, as the nettle, &c.

N^o XII. A MARGIN is either,

- 174 Entire, linear without the least dent or notch.
 175 Crenated, having notches without respect to the extremity, f. 74.
 176 Serrated, saw toothed, all the notches and teeth looking towards the extremity, f. 67, 68.
 177 Ciliated, having parallel bristles set in a row lengthwise, like eye-lashes.
 178 Dentated, toothed, with the points patent and asunder, f. 66.
 179 Repand, having a plain serpentine form, f. 65.

N^o XIII. An APEX or Point is either,

- 180 Obtuse, terminated within the segment of a circle, f. 76.
 181 Emarginated, terminated by a notch, f. 80, 81.
 182 Retuse, terminated by a round bosom.
 183 Truncated, terminated by a transverse line.
 184 Acute, terminated by an acute angle, f. 77.
 185 Acuminated, terminated by a subulated or awl-shaped point, f. 78.
 186 Cuspidated, terminated by a bristle or prickle.

SPECIAL TERMS.

N^o XIV. A ROOT is either,

- 187 Fibrous, consisting wholly of small fibres.
 188 Bulbous, furnished with a bulb (19).
 189 1. Solid (28).
 190 2. Scaly, with the scales imbricated (390).
 191 3. Tunicated, having coats above coats.
 192 Tuberos, consisting of fleshy parts connected by threads to the base.
 193 Fascicular, consisting of fleshy parts connected to the base without the intervention of threads.
 194 Granulated, composed of small fleshy particles.
 195 Fusiform, spindle-shaped, single and tapering, f. 165.
 196 Repent, running out a great way, and budding here and there.

N^o XV. A TRUNK is,

- 197 1. A stem or stalk (f. 147, 148), a trunk supporting both the fructification and the leaves.
 198 2. A culm, proper to grasses, f. 147.

- 199 3. A scapus or shaft; a trunk supporting the fructification, but not the leaves, f. 149.
 200 4. A stipes or stock; a trunk changing into leaves.
 201 Scandent, climbing, but needing the support of other bodies.
 202 Voluble, twining, ascending (45) in a spiral line by the assistance of other bodies.
 203 Repent, creeping, lying on the ground and sending out roots here and there. See 196, f. 167.
 204 Sarmentose, full of twigs, filiform, with rooting joints.
 205 Stoloniferous, putting forth young shoots at the root, or tillering.
 206 *Simplissimus*, very simple, having scarcely any branches.
 207 *Simplex*, simple, extended in a continued series towards the top.
 208 Entire, with the branches gathering inwards.
 209 Proliferous, putting forth branches only from the middle of the top.
 210 Subramose, having only a few lateral branches.
 211 Ramose, having many lateral branches.
 212 *Ramosissimus*, very ramose, loaded with numerous branches, without any determinate order.
 213 Virgated, having small weak pliant branches of unequal length.
 214 Panicled, having branches variously subdivided.

N^o XVI. A PETIOLE is either filiform, or,

- 215 Alated, winged, dilated on the sides.
 216 Spiniferous, hair and pricking.

N^o XVII. A LEAF is either simple or compound.

- A. A *simple Leaf*, f. 37 to 43, may be,
 217 Submersed, hid under the face of water.
 218 Natant, swimming, lying on the surface of the water.
 219 Acerous, chaff like, linear and persistent (26), f. 141.

The Insertion of Leaves.

- 220 Petiolated, having a petiole inserted at its base, f. 129.
 221 Petated, or targetted, having the petiole in the disk of the leaf, f. 128.
 222 Adnate, connected with the branches at the base on the upper side.
 223 Connate, having the opposite pairs united at the base on each side, f. 134.
 224 Coadunate, having more than two united.
 225 Decurrent, having the base of the leaf running along the stalk downwards, f. 131.
 226 Amplexicaul, having the base surrounding or embracing the stalk, f. 132.
 227 Perfoliated, having the base surrounding the stalk straight across, without any opening before, f. 133.
 228 Vaginating, or sheathing, having the base forming a tube that covers the stalk, f. 135.

B. 1. A Leaf is called Compound, when the same Petiole produces more Leaves than one. It is

- 229 Articulated, jointed, when one leaf grows out of the top of another, f. 111.

- 230 Digitated, when a simple petiole connects leaflets or small leaves at the top. Binate, ternate, &c. are modifications of this according to the number of leaflets thus connected, f. 102.
- 231 Pedated, when a bifid or forked petiole connects several leaflets only by the inferior side, f. 103.
- 232 Pinnated, or feathered, when a simple petiole connects any number of leaflets to its sides. Bijugous (double-paired), quadrijugous (four-paired), &c. when only four, eight, &c. leaflets are thus connected, f. 104—110.
- Pinnated with an odd one, when terminated by a single or odd leaflet,
- abruptly, when terminated neither by a tendril nor by a leaflet.
- circuous, when terminated by a tendril (15).
- with opposite (127) leaflets.
- with alternate (128) leaflets.
- with interrupted leaflets, when the leaflets are alternately greater and smaller.
- with decursive leaflets, or leaflets running down the petioles.
2. *A Decomposed Leaf is either,*
- 233 Bigeminous, or double twin, leaves, when the petiole is dichotomous, or successively divided into two, and every top carries a pair of leaflets.
- 234 Biternated, doubly ternated (230), f. 113.
- 235 Bipinnated, doubly pinnated (232), f. 114.
3. *A Supradecomposed Leaf is either,*
- 236 Tergeminous, when the petiole being twice dichotomous, or divided into two, bears a pair of leaflets.
- 237 Internated, thrice ternated, f. 115.
- 238 Tripinnated, thrice pinnated, f. 116.
- Stipula, or Seale.*
Cirrus, or Tendril.
- N^o XVIII. PUBES, *the hair, wool, &c. of plants, is either,*
- 239 *Tomentum*, a flock. *filia* interwoven hairs (*villi*), scarcely visible. See 160 241, and f. 84.
- 240 *Pili* (164), excretory ducts of a plant resembling setæ or bristles (166).
- 241 *Villi* (161), soft hairs.
- 242 *Lana* (163), curled thick hairs.
- 243 *Burta*, a beard, parallel hairs.
- 244 *Strigæ*, comb-teeth, stiff rigid plain hairs.
- 245 *Setæ*, bristles, stiff round hairs.
- 246 *Pala* (170), a membranaceous seale (33).
- 247 *Hanus*, hook, an acuminate (185) crooked point.
- 248 *Glochis*, a point or prickle with many teeth turned backwards.
- 249 Glandule, a papilla, or small gland secreting moisture, f. 155. a.
- 250 Utricle, a small vessel full of fermented moisture.
- 25 Viscosity, expresses the quality of tenacious moisture.
- 252 Guttinosity, expresses the quality of slippery humour.
- N^o XIX. ARMA, *the arms of plants, are either,*
- 253 *Aculei*, prickles, pricking points affixed only to the bark.
- 254 *Furcæ*, forks, prickles (253) divided or forked.
- 255 *Spinæ* (172), thorns, points or prickles put forth from the wood of the plant, f. 157.
- 256 *Stimuli* (273), points producing inflammatory punctures, whereby the parts become itching.
- N^o XX. *A BRACTEA, or floral leaf.*
- 257 *Coma*, the bractæ or spangles on the top of the stalk of some plants, remarkable in size compared to the other leaves.
- N^o XXI. *A PEDUNCLE is either,*
- 258 Common, to more flowers than one.
- 259 Partial, bearing any number of flowers of the common peduncle.
- 260 A pedicle, proper to flowers in a common peduncle.
- 261 Cernuous, sloping, having the top looking to the ground.
- 262 Retrofract, broken backward, reduced to a depending state as if by force.
- 263 Multiflorous, producing many flowers.
- 264 INFLORESCENCE is the mode in which flowers are connected to the peduncle of a plant; and this is either,
- 265 1. *Verticillus*, a whirl, when a number of flowers surround the plant in a ring.
- 266 2. *Capitulum*, a knot, when a number of flowers are collected together in form of a globe. It signifies also the upper parts of the fructification of mosses.
- 267 3. *Fasciculus*, a bunch, when erect parallel flowers of equal height are collected together (392).
- 268 4. *Spica*, a spike, when sessile alternate flowers are placed on a common simple peduncle. A spike is either
- 269 Simple, continued and undivided.
- 270 Compound, when more small spikes stand on one peduncle.
- 271 Glomerated, when the small spikes are crowded together, without any certain order.
- 272 Interrupted, when the smaller spikes are placed alternately and distant one from another.
- 273 5. *A corymbus*, is formed of a spike (268), having every single flower provided with a pedicle of its own, and the whole elevated to a proportionable height, f. 32.
- 274 6. *Racemus*, a cluster, when the common peduncle has lateral branches, f. 33.
- 275 Unilateral, when all the flowers grow on one side.
- 276 7. *Panicula*, a panicle, when the flowers are spike, and grow on peduncles variously divided, f. 36.
- 277 8. *Thyrsum*, a panicle (276) gathered into an ovate (64) form.
- 278 *Umbella*, an umbel; a receptacle (13) lengthened out from one centre into filiform peduncles rising to a proportionable height, so as to resemble an umbrella above, f. 4. b. b.
- 279 Simple, when all the peduncles spring out of one and the same receptacle.
- 280 Compound, when every peduncle carries a small umbel on its top.

- 281 *Umbellula sessilis*, a small sessile umbel, when a number of peduncles rise from the same centre, and stand equally all around it.
 282 *Cyma*, a receptacle rising from the same general centre, with partial ones here and there, and lengthened into peduncles all equally high at top.
 283 *Rachis*, a filiform receptacle connecting any number of florets into a long spike.
 284 *Spathix*, the receptacle of a palm-tree rising within a *spatha* or sheath, and divided into fructifying branches, f. 2.

Nº XXII. FRUCTIFICATION *is*,

- 285 The temporary part of a vegetable, destined to generation. And is either
 286 Simple, consisting of few flowers.
 287 Compound, when a number of flowers are set together.
 A. *Calyx*, the Cup.
 288 1. *Perianthium*, a cup contiguous to the fructification, f. 18.
 289 — of the fructification, containing the stamina (9) and the germen (333).
 290 — of the flower, containing stamina without a germen.
 291 — of the fruit, containing a germen without stamina.
 292 — *a*, Proper, belonging to any particular flower. And is either
 293 — Monophyllous, consisting only of one leaf.
 294 — Polyphyllous, consisting of a number of leaves.
 295 — Superior, having the germen below the receptacle.
 296 — Inferior, having the germen above the receptacle.
 297 — *b*, Common, containing a number of flowers set together.
 298 — Calyculated, a calyx or cup, having, as it were, another lesser cup round its base.
 299 2. *Involucrum*, or wrapper, a cup remote from a flower, f. 4.
 300 — Universal, set under an universal umbel, (278) f. 4. aa.
 301 — Partial, set under a partial umbel f. 4. dd.
 302 — Proper, set under any particular flower.
 303 3. *Gluma*, a glume or chaff, the cup of any kind of grass, consisting of valves embracing one another, f. 3. Either
 304 — Uniflorous, containing a single flower.
 305 — Multiflorous containing any number of flowers.
 306 *Arista*, or awn, f. 3. aa. a tapering point growing out of the glume or chaff; either straight, or
 307 Tortile, twisted like a cord.
 308 4. *Anastom.*, a catkin consisting of a chaffy common receptacle like a gem or bud, f. 6.
 309 5. *Spatha*, *spathæ* or sheath, a cup opening longitudinally, f. 1.
 310 6. *Calyptra* hood, the cowl-shaped cup of some mosses placed over the anthera (331) f. 5.
 311 7. *Volva*, the membranaceous cup of a mushroom.
 — 2. *Perichæium*, a circular tuft of fine hair-like leaves surrounding the bases of the filaments in the genus *Hymenium*.

B. *Corolla*, or coloured part of a flower.

- 312 Petal, a part of a corolla when divided into more parts than one, f. 13. bb.
 313 Tube, the inferior part of a monopetalous corolla, f. 11. a.
 314 Limb, the superior spreading part of a monopetalous corolla, f. 13, 14.
 315 *Unguis*, heel, the inferior part of a polypetalous corolla affixed to the receptacle.
 316 *Lamina*, lappet, the superior spreading part of a polypetalous corolla, f. 14.
 317 Regular, equal in figure, magnitude, and proportion of parts.
 318 Irregular, when the segments of the limb differ in figure, magnitude, or proportion of parts.
 319 Ringent, irregular (318) gaping like two lips opened very wide.
 320 *Galea-ringentis*, the vizard or upper lip of a ringent corolla,
 321 *Faux*, the throat or opening between the segments of a corolla where the tube (313) terminates.
 322 Cruciated, crossed, having four equal and patent petals.
 323 *Personata*, masked, ringent (319), but shut close between the lips by the palate.
 324 Papilionaceous, butterfly-shaped, irregular; the inferior petal being cymbiform or shaped like a boat (called the *carina* or keel); the superior ascending, (called the *vexillum* or flag); the side petals standing single (called the *alæ* or wings).
 325 Compound, consisting of a number of florets, on a common receptacle, and within a common perianthium.
 326 1. Ligulated, having all the exterior florets plain on the outside.
 327 2. Tubulous, having all the small corollæ of the florets tubulated.
 328 3. Radiated, having all the small corollæ of the disk tubulous, and those of the circumference ligulated and of a different form.
 329 Nectary, the melliferous part proper to any flower, f. 15, 16.

C. *Stamen*, a Chive.

- 330 Filament, the part supporting the anthera, and connecting it with the plant, f. 18. ee.
 331 Anthera, the part of a flower which is full of pollen (332) or fine flower-dust, which it discharges as soon as itself comes to maturity, f. 18. ff, g.
 332 Pollen, flower-dust, bursting by being brought into contact with moisture, and throwing out elastic atoms. (According to the principles of the sexual system, this is the origin of generation in plants).

D. *Pistillum*, a Pistil.

- 333 Germen, the rudiment of the unripe fruit in a flower. This is either,
 334 Superior, included in the corolla.
 335 Inferior, placed below the corolla.
 336 Style, the part of the pistil that raises the stigma (337) from the germen, f. 18. c.
 337 Stigma, the summit of the pistil bedewed with moisture, f. 18. d.

- E. Pericarpium*, a Fruit-case, is a
 338 1. Capsule, a fruit-case, hollow and opening in a certain determinate manner, f. 23, 24, 25.
 339 2. Valvule, a screen or defence, with which the fruit is covered on the outside.
 340 *Loculamentum*, a hole or cavity for lodging the seeds.
 341 *Dissepimentum*, a partition, by which the fruit is distinguished or divided within, into any number of cavities, f. 29.
 342 Bicapsular, having two capsules (338).
 343 Bilocular, having two cavities (340).
 344 Tricoccos, a capsule having three protuberant knobs, and divided into three cavities within, each containing one seed.
 345 Didymous, having two knobs protuberant on the outside.
 346 *Siliqua*, a husk; a fruit-case having two valves, and attaching the seeds along both sutures, f. 23, 24.
 347 *Torulosa*, having prominences swelling out on each side.
 348 *Parallelum dissepimentum*, a parallel partition of equal breadth with the valves.
 349 *Contrarium dissepimentum*, a cross partition narrower than the valves.
 350 3. *Legumen*, a pod or fwoeb; a pericarpium having two valves, and attaching the seeds only along the one suture, f. 23.
 351 *Isthmis interceptum*, having parts at regular distances straiter than the rest, so as to divide it across into different internal cavities.
 352 4. Follicle, a pericarpium of one valve, opening longitudinally on one side, and not having the seeds attached to the suture, f. 22.
 353 5. *Drupe*, plum; a pericarpium stuffed with fleshy substance, without any valve, and containing a nut or stone in the middle, f. 26.
 354 5. *Pomum*, apple or pear; a pericarpium stuffed with fleshy substance without valves, and containing a capsule or seed-case in the middle, f. 25.
 355 6. *Bacca*, berry; a pericarpium full of pulpy or soft substance, without valves, and containing seeds otherwise naked.
 356 7. Nidulant, nestling; seeds dispersed through a pulpy or soft substance.
 357 8. *Strobilus*, cone; a pericarpium formed by the induration of the scales of a catkin, (308). f. 7.

F. Semen, Seed.

- 358 *Hilum*, speck; the external scar or mark of the seed, occasioned by its attachment to the fruit-case before it come to maturity.
 359 *Corculum*, the original substance of a new plant within a seed.
 360 *Corona*, crown, or dress adhering to the top of a seed, by which it is enabled to fly about after it is ripe.
 361 *Pappus*, down; a feathery or hairy crown with which it flies, f. 31.
 362 *Stipitatus*, stalked, having a thread betwixt it and the down.

- 363 Capillary, consisting of fine undivided hairs.
 364 Plumose, feathery; consisting of hairs feathered on the sides.
 365 *Cauda*, tail; a thread or membrae at the end of a seed.
 366 *Hamus*, a hook, (247).
 367 *Calculus*, the interior and proper integument of a seed.
 368 *Nux.* kernel; a seed covered with a bony shell.
 369 *Arillus*; the outer coat of a seed, which falls off of its own accord.

G. Receptaculum, n Receptacle.

- 370 Common, containing more flowers and fruits than one.
 371 Compound, or composite flower; having the receptacle dilated and entire, the florets sessile.
 372 Aggregate flower; having the receptacle dilated, and the florets subpedicelated, or standing on very short flower-stalks.

Bulbus, a bulb. *Gemma*, a gem or bud.

Nº XXIII. VERNATION is the

- 373 Disposition of leaves within the bud (20).
 374 Conduplicated, doubled together, having the opposite edges approaching each other in parallel lines.
 375 Convoluted, rolled together spirally like a cowl.
 376 Involute, rolled inwards, having the edges on both sides rolled spirally, so as to be nearly met on the upper surface of the leaf.
 377 Revolute, rolled backwards, having the edges on both sides rolled spirally, so as to be nearly met on the back of the leaf, f. 123.
 378 Equitant, riding, when two leaves opposite to each other close their edges, so that the one includes or clasps about the other.
 379 Oblvolute, when two edges of one leaf close on the upper surface, so that one edge divides or lies betwixt the two sides of the other.
 380 Plicated, plaited, gathered into various plaits, f. 73.
 381 Circinal, rolled spirally from the top to the base, so that the top comes to occupy the centre.

Nº XXIV. GENERAL TERMS to be added.

- 382 *Laxus*, flexible at pleasure. *Debilis* (weak), and *flaccidus* (flagging) are almost synonymous.
 383 Rigid, not enduring to be bent.
 384 Articulated (229), jointed or knotted.
 385 *Enodis*, without joints or knots.
 386 *Pramorsus*, forebitten; having the top as it were bitten off f. 54.
 387 Radicant, pushing down roots.
 388 Squamos, covered with scales.
 389 Proliferous flowers, having one flower rising within another.
 390 Imbricated parts, one overlapping another like tiles or scales, f. 10.
 391 Squarrose, rough or scurfy, applied to the tops or irregular segments of leaves, &c. when they stand out on all sides.
 392 Fastigiatus, trunks, branches, or peduncles rising all alike high.

- 393 Refupinated, turned upſide down.
 394 Lacerated, a term applied to the edges of flowers or leaves when divided irregularly as if they were torn.
 395 Lacinated, divided into parts or ſegments in an indeterminate manner, f. 60.

TERMS omitted to be inſerted in their proper places.

- 396 Brachiated branches, when each pair ſtands at right angles with the pairs immediately above and below them, f. 116, 117.
 397 Ap'yllous, without any leaves.
 398 Adverſe leaves, turning their faces, not to the ſky but to the ſouth; as, *Anomum*.
 399 *Arlozeus*, arboſcent, of the nature of a tree producing buds. A term of great lubricity.
 400 Bulbiferous, bearing bulbs.
 Bulbs are either
 401 Scaly, conſiſting of imbricated lamellæ, as the lily root, f. 161.
 402 Solid, conſiſting of ſolid ſubſtance; as the tulip, f. 162.
 403 Tunicated, coated, like the common onion, f. 163.
 404 Articulated, conſiſting of lamellæ linked together as the *Lathraea*.
 405 Calcareous, of a hard crumbly nature, like dry lime plaſter.
 406 *Circumſiſſus*, parting as if cut ſtraight over; as the capsule of *Sallariz*.
 407 Cirrhouſ, terminating in a tendril.
 408 Columella, the part of a fruit-caſe that connects the internal partitions with the ſeeds.
 409 Intortion, the twiſting of any part towards one ſide:
 410 To the right, ſuppoſing one's ſelf placed in the centre;
 411 To the left, ſuppoſing one's ſelf placed in the centre.
 412 Cotyledon, the lateral body or lobe of a ſeed, porous, and imbibing moiſture, and afterwards falling off.
 413 *Acotyledones*, plants whoſe ſeeds have no lateral bodies or lobes; as the *Muſci*.
 414 *Monocotyledones*, plants whoſe ſeeds have only one lateral body; as the Graſſes, &c.
 415 *Dicotyledones*, plants whoſe ſeeds have two lateral bodies or lobes; as the *Legumina*, &c.
 416 *Polycotyledones*, plants whoſe ſeeds have many lateral bodies or lobes; as the Pines, &c.
 417 Monoſpermous, capsules or ſeed-caſes that contain only one ſeed.
 418 Di—tri—tetra—penta,—&c. ſpermous, containing 2, 3, 4, 5, &c. ſeeds in one capsule.
 419 Polyſpermous, containing many ſeeds.
 420 *Suberoſus*, reſembling cork.
 421 *Echinatus*, beſet with ſpines or prickles, ſo as to reſemble a hedge-hog.
 422 *Muticus*, without awn, beard, or prickle.
 423 *Pilus*, the hat or bonnet of a muſhroom, which has the fructifications on its under ſide, f. 8. a.
 424 *Diſcus*, the middle part of a compound flower, conſiſting of regular florets.
 425 *Radius*, the rim or outward part, conſiſting of irregular florets.

SECT. V. *Of the Sexes of Plants.*

As many philoſophers and botaniſts deny that ſuch a thing as the diſtinction of ſexes takes place in vegetables, it will be neceſſary to give a narration of the arguments employed by both parties on this ſubject. We ſhall begin with the arguments in favour of the ſexes.

I. Linnæus is at great pains in tracing the notion of ſexes in plants to the remotest periods of antiquity. He informs us, that Empedocles, Anaxagoras, and other ancient philoſophers, not only attributed the diſtinction of ſexes to plants, but maintained that they were capable of perceiving pleaſure and pain.

Hippocrates and Theophrastus are next introduced as diſtinguiſhing the conyza, the abies, the filix, &c. into male and female. The latter of theſe writers affirms that the fruit of the male palm will not germinate, unleſs the pollen of the male be ſhaken over the ſpatha of the female previous to the ripening of the ſeed.

Dioſcorides takes notice of a male and female mandragora, mercurialis, ciſtus, &c.

Pliny does not confine his views of ſex to animals, but exclaims, that every thing this earth produces is characterized by the diſtinction of ſex.

From the days of Pliny to thoſe of Cæſalpinus, who lived in the 16th century, the analogy between the vegetable and animal ſeems to have been entirely neglected. Cæſalpinus tells us, that the males of the oxycedrus, taxus, mercurialis, urtica, and cannabis, are barren; and that the females of theſe plants only bear fruit.

After Cæſalpinus, we find Dr Grew and Sir Thomas Millington engaged in a converſation concerning the utility of the ſtamina and ſtyli of plants. The reſult of this converſation was the mutual agreement of theſe two eminent naturaliſts, that the ſtamina and ſtyli of vegetables were analogous to the organs of generation in animals, and that they were adapted by nature to answer the ſame purpoſes. Dr Grew in his anatomy of plants, after enumerating the analogies between plants and animals, concludes, that the pollen probably emits certain *vivific* effluvia, which may ſerve for the impregnation of the ſeeds.

Mr Ray gave a further ſanction to the doctrine of ſexes, by concurring with Grew, and adding ſome further illustrations from analogy.

In the year 1695, Camerarius attempted to prove the ſexes of plants. But, as he truſted ſolely to the palm-tree, and withal ſeemed to be doubtful as to the authenticity of the fact, he cannot be conſidered as having done any thing in confirmation of the ſexual hypotheſis.

Mr Morland, in the year 1703, adopted the ſame hypotheſis; but gave it a new modification, by ſuppoſing that the pollen contained the ſeminal plant in miniature, and conſequently that it behoved one pollen at leaſt to be conveyed into every ſeparate ſeed before it could be properly impregnated. Analogy and the ſtructure of the parts are the only arguments he employs.

Some years after this, Mr Geoffroy wrote a treatiſe on the ſexes of plants: but as he advanced nothing new, we ſhall take no farther notice of him.

Vaillant, in the year 1717, judiciously considering that the canal in the stylus of most plants was too narrow to admit the pollen itself, republished Dr Grew's theory of impregnation by means of a subtle feminal aura.

These are the sentiments of the principal botanists with regard to the generation of plants, till the celebrated Linnæus made his appearance as a botanical writer, who has extended the idea so far as to compose a complete system upon it.

Although Linnæus can have no claim to the supposed discovery of the sexual hypothesis, his being precisely the same with that of Dr Grew; yet, as he is the chief supporter and improver of this doctrine, we shall give a succinct narration of the arguments he makes use of in order to prove that vegetables propagate their species by a regular commerce of sexes.

In a treatise intitled, *Sponsalia Plantarum*, published as an inaugural dissertation by Wahlbom, in the first volume of the *Annuitates Academicæ*, all the arguments made use of by Linnæus in his *Fundamenta Botanica*, and other works, are collected and arranged in one view. But as Wahlbom honestly attributes all the merit of this dissertation to his great master, we shall here drop his name altogether, and give the arguments as the property of Linnæus, by whom they were originally employed.

Linnæus, then, first attempts to show, that vegetables are endowed with a certain degree of life; and, secondly, that they propagate their species in a manner similar to that of animals.

"That vegetables are really living beings (says he), must be obvious at first sight; because they possess all the properties contained in that accurate definition of life laid down by the great Dr Harvey, namely, *Vita est spontanea propulsio humorum*. But universal experience teaches, that vegetables propel humours or juices: hence it is plain that vegetables must be endowed with a certain degree of life."

Not trusting solely to a syllogism founded on a definition, Linnæus proceeds to support the life of vegetables by arguments drawn from the following particulars in their œconomy; the first of which he intitles,

"*Nutritio*.—The very idea of nutrition implies a propulsion of humours, and of course the idea of life. But vegetables derive their nourishment from the earth, air, &c. and consequently must be considered as living creatures.

"*2. Ætas*.—Every animal must not only begin to exist, and have that existence dissolved by death, but must likewise pass through a number of intermediate changes in its appearance and affections. *Infancy, youth, manhood, old age*, are characterised by *imbecility, beauty, fertility, dotage*. Are not all these vicissitudes conspicuous in the vegetable world? Weak and tender in *infancy*; beautiful and salacious in *youth*; grave, robust, and fruitful, in *manhood*; and when *old age* approaches, the head droops, the springs of life dry up; and, in fine, the poor tottering vegetable returns to that *dust* from whence it sprung.

"*3. Motus*.—No inanimate body is capable of self-motion. Whatever moves spontaneously, is endowed with a living principle: for motion depends on the spontaneous propulsion of humours; and wherever there is a spontaneous propulsion of humours, there also is life.

Vol. III. Part II.

That vegetables are capable of motion, is evident from the following facts: plants, when confined within doors, always bend towards the light, and some of them even attempt to make their escape by the windows. The flowers of many plants, especially those of the syngenesia class, pursue the sun from east to west, rejoicing in his beams. Who then can deny that vegetables are possessed of living and self-moving powers?

"*4. Morbus*.—The term *disease* means nothing more than a certain corruption of life. It is well known, that vegetables are subject to diseases as well as animals: when over-heated, they turn thirsty, languish, and fall to the ground; when too cold, they are tormented with the chilblain, and not unfrequently *expire*: they are sometimes afflicted with cancers; and every plant is infested with lice peculiar to its species.

"*5. Mors*.—Death is opposed to life, the former being only a privation of the latter. Experience shows, that every living creature must die. But as vegetables are daily cut off by internal diseases and external injuries; as they are subject to death from the attacks of hunger, thirst, heat, cold, &c. with what propriety could vegetables be thus said to *die*, unless we allow that they previously *lived*?

"*6. Anatomia*.—Under this article we are referred to Malpighius and Grew for the organic fibres, membranes, canals, vesicles, &c. of plants, as additional proofs of their living powers.

"*7. Organizatio*.—Vegetables not only propel humours, but also prepare and secrete a number of different juices for the fruit, the nectar, &c. analogous to the various secretions in animal bodies."

From these facts and observations, Linnæus concludes, that plants are unquestionably endowed with life as well as animals; and then proceeds in the following manner to show how these animated vegetables propagate their species.

After discussing the long exploded doctrine of equivocal generation, he lays hold of another maxim of Dr Harvey, viz. *Omne vivum ex ovo*.—"It being fully evident (says he), from the foregoing chain of reasoning, that vegetables are endowed with life, it necessarily follows, agreeable to this maxim of Harvey's, that every vegetable must in like manner derive its existence from an egg. But as vegetables proceed from eggs, and as it is the distinguishing property of an egg to give birth to a being similar to that which produced it, the seeds must of course be the *eggs* of vegetables.

"Granting then that the seeds of vegetables are intended by nature to answer the same end as the eggs of animals, and considering at the same time that no egg can be fecundated without receiving an impregnation from the male, it follows, that the seed or eggs of vegetables cannot be fecundated by any other means. Hence also the necessity of vegetables being provided with organs of generation. But where are these organs situated? The answer is easy:—We have already found impregnated seeds within the flowers of plants; and it is natural to expect that the *genitalia* should not be at a greater distance. Now, as *copulation* always precedes *birth*, and every *flower* precedes the *fruit*, the *generating faculty* must be ascribed to the *flower*, and the *birth* to the *fruit*. Again, as the *antheræ* and *stigmata* are the only essential parts of flowers, these parts must necessarily be the *organs of generation*."

Being thus far advanced, Linnæus affirms, that the *antheræ* are the *testes*, and that the pollen performs the office of the male *semen*. These affirmations he attempts to establish by the following arguments; the first of which he terms,

“ 1. *Precedentia*.—The antheræ, or vegetable testes, always precede the fruit; and as soon as the antheræ come to maturity, which constantly happens before the maturity of the fruit, they continue to throw out their pollen as long as the flower lasts; but decay and fall off whenever the fruit comes to perfection.

“ 2. *Situs*.—The antheræ of all plants are uniformly situated in such a manner that the pollen may with the greatest facility fall upon the stigma or female organ.

“ 3. *Tempus*.—The antheræ and stigmata always flourish at the same time, whether the flowers be of the hermaphrodite or dioicous kind.

“ 4. *Loculamenta*.—When the antheræ are dissected, they discover as great a variety of structure as the pericarpia or seed capsules: for some of them have one cell, as the mercury; some two, as the hellebore, &c.

“ 5. *Castratio*.—If all the antheræ be cut off from an hermaphrodite plant, just before the flowers begin to expand, taking care at the same time that no plant of the same species grow near it, the fruit will either prove entirely abortive, or produce barren seeds.

“ 6. *Figura*.—When the pollen of different plants is examined by the microscope, it exhibits as great a variety of figures as is discoverable in the seeds themselves.

“ The accumulated force of these arguments (concludes Linnæus) amounts to a full demonstration that the antheræ are the testes, and that the pollen is the semen or genitura of vegetables.

“ The male organ being thus investigated, we hope (says Linnæus) that none will hesitate to pronounce the stigma to be the female organ, especially when the following observations are sufficiently attended to.

“ The pistillum is composed of the germen, stylus, and stigma. The germen, being only a kind of rudiment of the future fetus or seed, ceases to exist as soon as the flower comes to maturity. Neither is the stylus an essential part, as many flowers have no stylus. But no fruit ever comes to maturity without the assistance of the stigma. It follows, that the stigma must be the female organ adapted by nature for the reception of the pollen or impregnating substance. This will appear still clearer from the following chain of reasoning.

“ 1. *Situs*.—The stigmata are always situated so that the pollen may with most ease fall upon them. Besides, it is remarkable, that in most plants (though not in all) the number of the stigmata exactly corresponds with the loculamenta or cells of the pericarpium.

“ 2. *Tempus*.—Here the observation, that the stigmata and antheræ constantly flourish at the same time, is repeated.

“ 3. *Decidentia*.—The stigmata of most plants, like the antheræ, decay and fall off as soon as they have discharged their proper function; which evidently shews, that their office is not to ripen the fruit, but solely to answer the important purpose of impregnation.

“ 4. *Abjissio*.—The argument here is precisely the

same with the castration of the antheræ; and the result is likewise the same, namely the destruction of the fruit.

“ These arguments (concludes Linnæus) are sufficient to demonstrate, that the stigma is the female organ of generation, or that organ which is suited for the reception and conveyance of the semen to the *vegetable eggs*. Hence plants may be said to be *in actu veneris*, when the antheræ or testiculi spread their pollen over the stigma or female *vulva*.”

To show how the *coitus* of vegetables is effected, is our author's next object of investigation. He affirms, that the pollen is conveyed, by means of the wind or insects, to the moist stigma, where it remains until it discharges a subtil fluid, which being absorbed by the vessels of the stigma, is carried to the seeds or ova, and impregnates them. His proofs are taken from the following particulars.

“ 1. *Oculus*.—When the flowers are in full blow, and the pollen flying about, every one may then see the pollen adhering to the stigma. This he illustrates by mentioning as examples the *viola tricolor*, *iris*, *campanula*, &c.

“ 2. *Proportio*.—The stamina and pistilla, in most plants, are of equal heights, that the pollen, by the intervention of the wind, may, with the greater facility, fall upon the stigma.

“ 3. *Locus*.—The stamina of most plants surround the pistillum, to give the pollen an opportunity of falling upon the stigma at every breeze of wind. Even in the monœcia class, the male flowers stand generally above the female ones, to afford an easier conveyance of the pollen to the stigma.

“ 4. *Tempus*.—It is remarkable that the stamina and pistilla constantly appear at the same time, even in plants belonging to the monœcia class.

“ 5. *Pluvia*.—The flowers of most plants expand by the heat of the sun, and shut themselves up in the evening or in rainy weather. The final cause of this must be to keep the moisture from the pollen, lest it should be thereby coagulated, and of course prevented from being blown upon the stigma.

“ 6. *Palmicole*.—That the cultivators of palm-trees were in use to pull off the spadices from the males, and suspend them over the spathe of the females, is attested by Theophrastus, Pliny, Prosper Alpinus, Kempfer, and many others. If this operation happened to be neglected, the dates were sour and destitute of nuts. Kempfer adds this singular circumstance, that the male spadix, after being thoroughly dried and kept till next season, still retained its impregnating virtue.

“ 7. *Flores nutantes*.—As the pollen is specifically heavier than air, such flowers as have their pistillum longer than the stamina, hang down, or incline to one side, *e. g.* the *fritillaria*, *campanula*, &c. An easy admission of the pollen to the stigma is the final cause of this appearance.

“ 8. *Submersi*.—Many plants that grow below water, emerge when their flowers begin to blow, and swim upon the surface till they receive their impregnation, and then sink down.

“ 9. *Omnium florum genuina consideratio*.—Here a number of particulars are recited. We shall confine ourselves to those that are most striking and applicable to the subject.

“ When

“When the flowers of the male hemp are pulled off before those of the female are fully expanded, the females do not produce fertile seeds. But as a male flower is sometimes found upon a female plant, this may be the reason why fertile seeds are sometimes produced even after this precaution has been observed.

“The tulip affords another experiment to the same purpose.—Cut off all the anthers of a red tulip before the pollen is emitted; then take the ripe antheræ of a white tulip, and throw the pollen of the white one upon the stigma of the red; the seeds of the red tulip being thus impregnated by one of a different complexion, will next season produce some red, some white, but most variegated flowers.”

In the year 1744, Linnæus published a description of a new genus, which he called *psoria*, on the supposition of its being a *hybrid* or *mule* plant, *i. e.* a plant produced by an unnatural commixture of two different genera. The root, leaves, caulis, &c. of this plant are exceedingly similar to those of the antirrhinum linaria; but the flower and other parts of the fructification are totally different. On account of its similarity to the linaria in every part but the flower, Linnæus imagined it to have been produced by a fortuitous commixture of the linaria with some other plant, although he has never yet been able to point out the father. This doctrine of the production of *mule* plants has since been greatly prized and carefully propagated by Linnæus and the other supporters of the sexual hypothesis. In the third volume of the *Amenitates Academicæ*, there is a complete dissertation, intitled *Plantæ Hybridæ*, wherein the doctrine of *vegetable mules* is much improved and extended. This dissertation contains a list of 47 mules, with their supposed fathers and mothers. For example,

The Veronica spuria is said to be a *mule* plant begot by the Verbena officinalis upon the Veronica maritima.

The Delphinium hybridum, a *mule* begot by the Aconitum napellus upon the delphinium elatum.

The Arctotis calendula, a *mule* begot by the Calendula pluvialis upon the arctotis triflis.

The Aclepias nigra, a *mule* begot by the Cynanchum acutum upon the Aclepias vincetoxicum, &c.

From the examples given in this dissertation, Linnæus draws this conclusion, That only two species of each genus existed *ab origine*; and that all the variety of species which now appear have been produced by unnatural embraces betwixt species of different genera.

Under this head, Linnæus likewise quotes from Ray the story of Richard Baal gardener at Brentford. This Baal sold a large quantity of the seeds of the brassica florida to several gardeners in the suburbs of London. These gardeners, after sowing their seeds in the usual manner, were surpris'd to find them turn out to be plants of a different species from that which Baal made them believe they had purchased; for, instead of the brassica florida, the plants turned out to be the brassica longifolia. The gardeners, upon making the discovery, commenced a prosecution of fraud against Baal in Westminster-hall. The court found Baal guilty of fraud, and decreed him not only to restore the price of the seeds, but likewise to pay the gardeners for their lost time, and the use of their ground. “Had these judges

(says Linnæus) been acquainted with the sexual hypothesis, they would not have found Baal guilty of any crime, but would have ascribed the accident to the fortuitous impregnation of the brassica florida by the pollen of the brassica longifolia.”

Linnæus next proceeds to celebrate the utility of insects, because they convey the pollen of the male to the stigma of the female. “In this way (says he), it is reasonable to think that many dioecious plants are impregnated. Nay, even the hermaphrodites themselves are greatly obliged to the different tribes of insects, which, by fluttering and treading in the corolla, are constantly scattering the pollen about the stigma.

“Upon the whole then, (concludes Linnæus), the coitus of vegetables is evident to a demonstration. This coitus is nothing more than the conveyance of the pollen to the stigma, to which it adheres till it bursts, and discharges a subtil elastic fluid. This fluid or aura is absorbed by the vessels of the stylus, and carried directly to the ovarium or germen, where the mysterious work of impregnation is fully completed.”

THESE are the arguments employed by Linnæus and other advocates for the sexual commerce of vegetables.—Let us next attend to those employed by the opposers of this hypothesis.

It is admitted by Pontedera, Dr Alton, &c. that some of the ancients applied the terms *male* and *female* to several plants. But then they deny that these terms conveyed the same ideas to the ancients that they do to the moderns. *Male* and *female*, when applied to plants, were to the ancients mere terms of distinction, serving only as trivial names to distinguish one species or variety from another. The ancients were ignorant of the very characters which constitute the difference between what is called a *male* and *female* plant among the moderns. Theophrastus, Dioscorides, Pliny, and, in a word, the whole ancient botanical writers, confound the very notion of the modern sexes: they call the real female, or seed bearing plant the *male*; and the male, or barren plant, the *female*. Nay, they have even applied the terms *male* and *female* to many plants which bear nothing but hermaphrodite flowers.

Such is the nature of this controversy, that it cannot be determined with any degree of certainty, but by experiments made upon dioecious plants. If a female plant can produce fertile seeds without having any communication with the pollen of the male, the use of this pollen with respect to the impregnation of seeds must of necessity be entirely superfluous.

Now, both Camerarius and Dr Alton tried these experiments with the same success. Those two eminent botanists took female plants of the mercury, spinage, and hemp; transplanted them at a great distance from any males of the same genus, and besides had them inclosed by double rows of hedges. The result was, that each of these plants produced great quantities of fertile seeds. Tournefort made the same trial upon the lupulus, Miller upon the bryony, and Geoffroy upon the mays; and all of them declare that the seeds of these plants were as fertile as if they had been surrounded by a thousand males.

Linnæus, in his first argument for the coitus of plants, refers every man to the evidence of his senses.

“Do we not see (says he) the stigma of almost every hermaphrodite

hermaphrodite flower covered over with the pollen or impregnating substance? Do not we see the parietaria, the urtica, &c. by violent explosions, discharging their pollen in the open air, that it may be carried in that vehicle to the stigmata of their respective females?—All this is admitted by the opposers of the sexes: but then they deny that these explosions, &c. are intended to create any intercourse between the male and the female; and further allege, that this ejection of the pollen is intended by nature to throw off something excrementitious, or at least something which, if retained, would prove noxious to the fructification.

Linnæus takes his second argument from the proportion which the stamina bear to the stylus, alleging that they are generally of the same height.—This observation (say the anti-sexualists) is not only contrary to experience, but, allowing it to be universal, no conclusion can be drawn from it either for or against the sexual hypothesis.

The third argument is taken from the *locus* or situation of the stamina with respect to the stylus: “and as the male flowers in the monœcia class stand always above the female flowers, it must be concluded (says Linnæus), that the intention of nature, in this disposition of the parts, is to allow a free and easy access of the pollen to the stigma.”—But the stamina cannot be said to surround the pistillum in the monandria and diandria classes: and the position of the male flowers in the monœcia class is a mere chimera: for in the ricinus, one of the examples which Linnæus mentions in confirmation of his doctrine, the female flowers stand uniformly some inches above the males.

That the stamina and pistilla generally come to perfection at the same time, and that this happens even in the dioecious plants, is Linnæus’s fourth argument. But, as it is acknowledged by Linnæus himself, that there are many exceptions with respect to this fact, the opposers of the sexual hypothesis allege that it carries the best answer in its own bosom.

The fifth argument is founded on the circumstance of some flowers shutting up their petals in rainy or moist evenings.—But many flowers do not shut themselves up, either in the night or moist weather, as the passion-flower, &c. The *lychnis noctiflora*, *mirabilis peruviana*, &c. open their flowers in the night, and shut them at the approach of the sun. Hence this is another final cause (say the anti-sexualists) perverted to support a favourite hypothesis.

We come now to the culture of the palm-tree, which is the sixth and most plausible argument employed by the sexualists. Of this, the most authentic account we have is the following by Dr Hasselquist, in one of his letters to Linnæus, dated Alexandria May 18th, 1750. “The first thing I did after my arrival was to see the date-tree, the ornament and a great part of the riches of this country. It had already blossomed; but I had, nevertheless, the pleasure of seeing how the Arabs assist its fecundation, and by that means secure to themselves a plentiful harvest of a vegetable, which was so important to them, and known to them many centuries before any botanist dreamed of the difference of sexes in vegetables. The gardener informed me of this before I had time to inquire; and would show me, as a very curious thing, the male and female of the date or palm-trees: nor could he conceive how I, a Frank, lately

arrived, could know it before; for, says he, all who have yet come from Europe to see this country, have regarded this relation either as a fable or miracle. The Arab seeing me inclined to be further informed, accompanied me and my French interpreter to a palm-tree, which was very full of young fruit, and had by him been wedded or fecundated with the male when both were in blossom. Thus the Arabs do in the following manner: When the spadix has female flowers, that come out of its spathe, they search on a tree that has male flowers, which they know by experience, for a spadix which has not yet burst out of its spathe: this they open, take out the spadix, and cut it lengthwise in several pieces, but take care not to hurt the flowers. A piece of this spadix with male flowers they put lengthwise between the small branches of the spathe which hath female flowers, and then lay the leaf of a palm over the branches. In this situation I yet saw the greatest part of the spadices which bore their young fruit; but the male flowers which were put between were withered. The Arab besides gave me the following anecdotes: First, unless they, in this manner, wed and fecundate the date-tree, it bears no fruit. Secondly, they always take the precaution to preserve some unopened spathe with male flowers from one year to another, to be applied for this purpose, in case the male flowers should miscarry or suffer damage. Thirdly, if they permit the spadix of the male flowers to burst or come out, it becomes useless for fecundation: it must have its *maidenhead* (these were the words of the Arab), which is lost in the same moment the blossoms burst out of their case. Therefore the person who cultivates date-trees must be careful to hit the right time of assisting their fecundation, which is almost the only article in their cultivation. Fourthly, on opening the spathe, he finds all the male flowers full of a liquid which resembles the finest dew; it is of a sweet and pleasant taste, resembling much the taste of fresh dates, but much more refined and aromatic: this was likewise confirmed by my interpreter, who hath lived 32 years in Egypt, and therefore had opportunities enough of tasting both the nectar of the blossoms and the fresh dates.”

Now, though this account seems fully to confirm the fact, *viz.* that such a practice obtains among the Arabs, and that they assert its efficacy in fecundating the trees, it is certain (say the opposers of this doctrine), that no intelligent person, who is not already wedded to an hypothesis, will attempt to found an argument upon the assertions of a people so full of ridiculous superstitions. Before Dr Hasselquist, or any other person, can draw any argument from the above mentioned account, he ought to see the experiment several times repeated, with his own eyes, and not take it upon the word of a people who, besides their superstition, may very probably find it their interest to impose upon travellers.

Mr Milne, author of the Botanical Dictionary, however, relates an experiment, near akin to the above-mentioned, which merits some attention: “In the garde de M. de la Serre, of the Rue S. Jacques at Paris, was a female turpentine tree, which flowered every year, without furnishing any fruit capable of vegetation. This was a sensible mortification to the owner, who greatly desired to have the tree increased.

Messieurs DuRoi and Joffeu very properly judged that they might procure him that pleasure by the assistance of a male palachio tree. They sent him one very much loaded with flowers. It was planted in the garden of M. de la Serre, very near the female turpentine tree, which the same year produced a great quantity of fruits, that were well-conditioned, and rose with facility. The male plant was then removed; the consequence of which was, that the turpentine-tree of M. de la Serre in none of the succeeding years bore any fruit that, upon examination, was found to germinate."

Upon this experiment it is observed by the antifexualists, that, though it were a thousand times repeated, it never could be decisive. The nature of the controversy, say they, is such, that one experiment is more decisive in favour of their opinion, than 10,000 can be against them. The reason is plain: If there is such a thing as a sexual intercourse in vegetables, it is as wonderful that any seeds should be perfected without that intercourse, as that a virgin should have a child; the last is not in the least more extraordinary than the first. One experiment, therefore, which shows that seeds may be perfected without such sexual intercourse, is either to be resolved into a miracle, or must prove absolutely decisive against the sexual system; while numberless experiments such as that above mentioned could prove nothing, because we know not what effect vegetables may have by growing in each other's neighbourhood, independent of any sexual intercourse.

In Milne's Botanical Dictionary, under the article *Sexus Plantarum*, the author quotes Dr Allston's experiments partially. The facts recorded by Dr Allston are as follow. 1. Three sets of spinach, planted at a great distance from each other, proved all of them fertile, and ripened plenty of seeds, which were found to answer as well as other spinach seed. 2. A plant of hemp growing by itself, being taken care of, produced about 30 good seeds, though in a situation very much exposed, and plucked up too soon, on account of bad weather, in the autumn. 3. This experiment, which is the most remarkable of the three, we shall give in the Doctor's own words. "In the spring of 1741, I carried two young seedling plants of the French mercury, long before there was any in, from the city physic garden, the only place where it was then to be found in this country, to the king's garden at the Abbey; which are more than 700 yards distant from one another, with many high houses, trees, hedges, and part of a high hill, between them: and planted one of them in one inclosure, where it was shaded from the sun the greatest part of the day; and the other in another, 25 yards distant, exposed to the south and west. Both plants ripened fertile seeds; and the last shed them so plentifully, that it proved a troublesome weed for several years, though none of the species was to be found in that garden for more than 20 years preceding."

Of this experiment Mr Milne hath not taken any notice; but upon the other two, has the following remark. "The result of these, and such like experiments, can be accounted for, on the principle of the sexes, in no other way than on the supposition that some male flowers have been intermixed with the female, and operated the fecundation in question. This appears the more probable, as only a part of the seeds

in the above experiments attained to perfect maturity, so as to be capable of vegetation."

The seventh argument of Linnæus is taken from the *flores natantes*.—The pills of these flowers, according to Linnæus, are always longer than the stamina; and nature has assigned them this pensile posture, that the pollen, which is specifically heavier than air, may the more conveniently fall upon the stigma.—But the pills of the campanula, lilium, and many other *flores natantes*, are not longer than the stamina. Besides, granting this were uniformly the case; yet, as the pollen is heavier than air, this posture must of necessity either make the pollen miss the pistillum altogether, or, at any rate, it can only fall upon the back part of the pistil in place of the stigma; and, of course, such a direction would rather tend to frustrate than promote the impregnation of the seed.

The eighth argument is taken from the *plante submersæ*, which are said to emerge as soon as their flowers begin to blow, lest the pollen should be coagulated or washed off by the water.—But many submarine and aquatic plants fructify entirely below water; and, supposing they did not, the same argument would equally prove it to be the intention of nature, that the pollen should be blown away by the winds, as that it should be subservient to the impregnation of the seed.

The ninth and last argument is intitled *Omniùm firum genuina consideratio*; which (say the antifexualists) is nothing more than a collection of vague observations upon the structure and œconomy of particular plants, some of them true, others false, but all of them evidently thrust in as supports to a favourite hypothesis.

Thus the dispute rested some years ago; but of late there has appeared a translation of one of Linnæus's works upon the subject, which, though published in 1759, was but little known in this country. A treatise on the Sexual System had also been published by the Abbé Spalanzani, in which he not only opposed the Linnæan doctrine, but treated it with ridicule, though without taking any notice of this last publication, which he seems to have been ignorant of. In this he mentions an experiment with hemp similar to some of those already related; but which was also tried by Linnæus, and in his hands turned out the very reverse of what it did with Spalanzani. In the treatise alluded to, Linnæus mentions Sir Thomas Millington as the first among the moderns who thought of the distinction of sexes in plants. He was Savilian professor at Oxford; and Dr Grew, in his anatomy of plants, relates, that, in a conversation on the nature of the antheræ of flowers, Sir Thomas hinted, that those parts might probably be analogous to the male organs of animals, and serve for the impregnation of the fruit. Grew improved on the idea and pursued it. That the subject, however, may be properly understood, our author is of opinion, that we should first accurately understand the nature of vegetable bodies; and in order to do this, we ought first to consider the operations of nature in the human frame, and from thence continue our researches through the various tribes of inferior animals, till at last we arrive at the vegetable creation. In like manner, to illustrate the generation of plants, we must likewise take our first lights from the animal kingdom, and pursue the same chain till we come to vegetables. This

subject, indeed, he owns to be so obscure, that no naturalists has hitherto been able to say any thing satisfactory concerning it; he only mentions some remarkable facts concerning the production of mule animals from the copulation of two individuals of different species. In the horse-kind we see two different kinds of mules produced. "From the mare and mule ass (says he) proceeds the mule properly so called, which in its nature, that is, in its medullary substance and nervous system, agrees with its mother; but in its cortical substance and outward form, in its mane and tail, resembles the ass. Between the female ass and the horse, the other kind of mule is engendered, whose nature or medullary substance resembles that of the ass; but its cortical structure that of the horse. If the he-goat of Angora copulates with the common she-goat, the kid, by that means procured, inherits the external structure and valuable coat of its father; while, on the other hand, if the common he-goat impregnates the goat of Angora, the kid produced has the same external form, and bears the same worthless hair with its father. Hence it seems probable, that the medullary substance, with what Malpighi calls the keel (*carina*), and the nervous system, are latent in the egg of the mother; the cortical substance, or vascular system, being derived from the father."

These cortical and medullary substances are previously explained by our author to be those of which both animal and vegetable bodies are composed. By the medullary substance in animal bodies, he means the spinal marrow arising from the organized brain, and sending off the nerves; by the cortical substance the vessels with the heart attached to them, by which the medullary part is nourished. In vegetables, the cortical part nourishes the plant, not only by its root, but with its whole surface. For a small branch torn from the parent stem, and placed in water, imbibes nourishment at its pores. Thus the *Fuci*, and other marine vegetables, are nourished without a root, solely by the pores diffused through their whole substance. The bark of trees every year deposits its gelatinous internal layer, which is added to the wood, and assimilates itself to it. The medullary, which is the other essential part of vegetables, is multiplied and extended without end; and whenever it is entirely lost, the death of the plant necessarily follows. In examining this substance, we must be careful, in two cases, that we be not misled; first, by the straws of grasses, and by other hollow stems, where the medulla lines the inside of the bark; and secondly, by large trees, whose trunks become perfectly solid throughout, except in the very summits of the branches. The wood performs the office of bones, when there is no longer any occasion for the medulla in that part; and trees, although become hollow, continue nevertheless to grow so long as this substance remains in the extreme branches. It is by no means necessary that the medulla should have any connection with the root, as it is only nourished by the cortical substance of the plant, and is therefore increased at its upper extremity without end if it meets with no resistance. In those animals whose spinal marrow is surrounded by a bony covering, as in the larger and more perfect kinds, this substance never comes out of its confinement; and the harder its case, the more absolutely is its increase prevented; but in the smaller tribes of worms, where

this covering is less rigid, a perpetual and unlimited increase of the animal takes place.

"The most important parts of the flower, and which are absolutely essential to it, (our author proceeds to observe †), are the stamina and pistilla. So essential are they, that among the many thousands of flowers with which we are acquainted, no one can be found not furnished with both these organs. The stamina derive their origin from the substance of the wood, which was originally formed from the inner bark, and they may therefore be said to spring from the cortical substance of the vegetable. This is perfectly evident in the *Afarum* (*Arababacca*), whose twelve stamina proceed from twelve fibres in the inner bark. Double flowers illustrate the same fact: in them, the stamina being weakened and dissolved by excess of nourishment, the woody substance re-assumes the softness of the inner bark, of which it was originally formed. All stamina consist of vessels containing the pollen, or impregnating powder, which they discharge in due time, not without the strictest observance of certain natural laws. The form of these vessels, like that of the capsules of the fruit, is accurately defined, as well as their cells, their particular manner of bursting, and the pollen which they contain; this pollen, likewise, is no less certain and uniform in its figure, size, and colour, than the seeds themselves.

"The pistillum is the only part which originates from the medullary substance, and is therefore invariably situated in the centre of the flower. It always contains the rudiments of the seed, which, in process of time, ripen into fruit. The rudiments of the fruit are called the *germen*, or seed-bud; this has constantly another organ connected with it, named the *stigma*, which is in its highest degree of vigour and perfection during the time of flowering.

"Another circumstance worthy of attention is, that the root, which the first year of its growth is large and filled with medullary pulp, the following season becomes hollow, in producing the stem, flowers, and seed; all this pulp being conveyed to the flower, and seeming to be only destined to the formation of seed, so many new and distinct animations being formed from it as there are rudiments of new plants. This is particularly observable in the turnip.

"Thus vegetables, like insects, are subject to a metamorphosis; with this difference only, that their flowers are fixed to one spot, instead of being able, like insects, to fly from place to place; and that their nourishment is not given them by means of peculiar organs for the formation of chyle. We have seen, that the outer bark becomes calyx, the internal bark corolla, the wood stamina, and the medulla pistillum; the fructification exhibiting the internal parts of a plant naked and unfolded. We have likewise seen, that the fructification puts an end to vegetation in the part from whence it arises, stopping the progress of the medulla, which would otherwise have extended itself without end by the branches, and occasioning the division of that medulla into a number of seeds, each endowed with a separate living principle. But as the medulla exils naked in the germen, it cannot support itself, or make any farther progress, without the assistance of the cortical substance which it has left; it must therefore receive this assistance by some means or other,

other, and in fact does receive it from the stamina and their pollen, which owe their origin to the woody matter derived from the inner bark, and originally generated by the outer bark. But if it happens that the cortical substance is able to invest the medullary rudiments of the seed in the flower itself, the plant becomes viviparous, as in *fishia*, *aira*, and *poa vivipara*, in which nearly the same thing takes place as in the medulla of other plants, which remains in the branches, and is variously distributed, being at once both clothed and nourished by the bark, and enabled to form new branches, just as it happens in the compound animals, or *fertularia*.

“The organs common in general to all plants are, 1. The root, with its capillary vessels, extracting nourishment from the ground. 2. The leaves, which may be called the *limbs*, and which, like the feet and wings of animals, are organs of motion; for being themselves shaken by the external air, they shake and exercise the plant. 3. The trunk, containing the medullary substance, which is nourished by the bark, and for the most part multiplied into several compound plants. 4. The fructification, which is the true body of the plant, set at liberty by a metamorphosis, and consists only of the organs of generation; it is often defended by a calyx, and furnished with petals, by means of which it in a manner flutters in the air.

“Many flowers have no calyx, as several of the lily tribe, the *hippuris*, &c.; many want the corolla, as grasses, and the plants called *apetalous*; but there are none destitute of stamina and pistilla, those important organs destined to the formation of fruit. We therefore infer from experience, that the stamina are the male organs of generation, and the pistilla the female; and as many flowers are furnished with both at once, it follows that such flowers are hermaphrodites. Nor is this so wonderful, as that there should be any plants in which the different sexes are in distinct individuals; for plants being immoveably fixed to one spot, cannot, like animals, travel in search of a mate. There exists, however, in some plants, a real difference of sex. From seeds of the same mother, some individuals shall be produced, whose flowers exhibit stamina without pistilla, and may therefore be properly called *males*; while the rest, being furnished with pistilla without stamina, are therefore denominated *females*: and so uniformly does this take place, that no vegetable was ever found to produce female flowers, without flowers furnished with stamina being produced, either on the same individual, or on another plant of the same species, and *vice versa*.

“As all seed-vessels are destined to produce seeds, so are the stamina to bear the *pollen*, or fecundating powder. All seeds contain within their membranes a certain medullary substance, which swells when dipped into warm water. All pollen, likewise, contains in its membrane an elastic substance, which, although very subtle and almost invisible, by means of warm water often explodes with great vehemence. While plants are in flower, the pollen falls from their anthers, and is dispersed abroad, as seeds are dislodged from their situation when the fruit is ripe. At the same time that the pollen is scattered, the pistillum pretends its stigma, which is then in its highest vigour, and, for a portion of the day at least, is moistened with a fine dew. The stamina either surround this stigma, or, if

the flowers are of the drooping kind, they are bent towards one side, so that the pollen can easily find access to the stigma; where it not only adheres by means of the dew of that part, but the moisture occasions its bursting, by which means its contents are discharged. What issued from it, being mixed with the fluid of the stigma, is conveyed to the rudiments of the seed. Many evident instances of this present themselves to our notice; but I have no where seen it more manifest than in the jacobean lily (*amaryllis formosissima*), the pistillum of which, when sufficient heat is given the plant to make it flower in perfection, is bent downwards, and from its stigma issues a drop of limpid fluid, so large that one would think it in danger of falling to the ground. It is, however, gradually re-absorbed into the style about three or four o'clock, and becomes invisible till about ten the next morning, when it appears again; by noon it attains its largest dimensions, and in the afternoon, by a gentle and scarcely perceptible decrease, it returns to its source. If we shake the antheræ over the stigma, so that the pollen may fall on this limpid drop, we see the fluid soon after become turbid, and assume a yellow colour; and we perceive little rivulets, or opaque streaks, running from the stigma towards the rudiments of the seed. Some time afterwards, when the drop has totally disappeared, the pollen may be observed adhering to the stigma, but of an irregular figure, having lost its original form. No one, therefore, can assent to what Morland and others have asserted, that the pollen passes into the stigma, pervades the style, and enters the tender rudiments of the seed, as Læwenhock supposed his worms to enter the ova. A most evident proof of the falshood of this opinion may be obtained from any species of *mirabilis* (marvel of Peru), whose pollen is so very large, that it almost exceeds the style itself in thickness, and, falling on the stigma, adheres firmly to it; that organ sucking and exhaling the pollen, as a cattle-fish devours every thing that comes within its grasp. One evening in the month of August I removed all the stamina from three flowers of the *mirabilis longiflora*, at the same time destroying all the rest of the flowers which were expanded; I sprinkled three flowers with the pollen of *mirabilis jalappa*; the seed-buds swelled, but did not ripen. Another evening I performed a similar experiment, only sprinkling the flowers with the pollen of the same species; all these flowers produced ripe seeds.

“Some writers have believed, that the stamina are parts of the fructification, which serve only to discharge an impure or excrementitious matter, and by no means formed for so important a work as generation. But it is very evident, that these authors have not sufficiently examined the subject: for as, in many vegetables, some flowers are furnished with stamina only, and others only with pistilla, it is altogether impossible, that stamina situated at so very great a distance from the fruit as on a different branch, or perhaps on a separate plant, should serve to convey any impurities from the embryo.

“No physiologist could demonstrate, *a priori*, the necessity of the masculine fluid to the rendering the eggs of animals prolific; but experience has established it beyond a doubt. We therefore judge *a posteriori* principally of the same effect in plants.

"In the month of January 1765 the *antholyza cunnia* flowered in a pot in my parlour, but produced no fruit, the air of the room not being sufficiently agitated to waft the pollen to the stigma. One day, about noon, seeing the stigma very moist, I plucked off one of the anthers, by means of a fine pair of forceps, and gently rubbed it on one of the expanded stigmata. The spike of flowers remained eight or ten days longer; when I observed, in gathering the branch for my herbarium, that the fruit of that flower only on which the experiment had been made had swelled to the size of a bean. I then dissected this fruit, and discovered that one of the three cells contained seeds in considerable number, the other two being entirely withered.

"In the month of April I sowed the seeds of hemp (*cannabis*) in two different pots. The young plants came up so plentifully, that each pot contained 30 or 40. I placed each by the light of a window, but in different and remote apartments. The hemp grew extremely well in both pots. In one of them I permitted the male and female plants to remain together, to flower and bear fruit, which ripened in July; and being macerated in water and committed to the earth, sprung up in twelve days. From the other, however, I removed all the male plants as soon as they were old enough for me to distinguish them from the females. The remaining females grew very well, and presented their long pistilla in great abundance, these flowers continuing a very long time, as if in expectation of their mates; while the plants in the other pot had already ripened their fruit, their pistilla having, quite in a different manner, faded as soon as the males had discharged all their pollen. It was certainly a beautiful and truly admirable spectacle, to see the unimpregnated females preserve their pistilla so long green and flourishing, not permitting them to begin to fade till they had been for a considerable time exposed, in vain, to the access of the male pollen. Afterwards, when these virgin plants began to decay through age, I examined all their calyxes in the presence of several botanists, and found them large and flourishing, although every one of the seed-buds was brown, compressed, membranaceous, and dry, not exhibiting any appearance of cotyledons or pulp. Hence I am perfectly convinced, that the circumstance which authors have recorded, of the female hemp having produced seeds, although deprived of the male, could only have happened by means of pollen brought by the wind from some distant place. No experiment can be more easily performed than the above; none more satisfactory in demonstrating the generation of plants.

"The *Clusia tenella* was in like manner kept growing in my window through the months of June and July. The male plant was in one pot, the female in another. The latter abounded with fruit, not one of its flowers proving abortive. I removed the two pots into different windows of the same apartment: still all the female flowers continued to become fruitful. At length I took away the male entirely, leaving the female alone, and cutting off all the flowers which it had already born. Every day new ones appeared from the axilla of every leaf; each remained eight or ten days; after which their footstalks turning yellow, they fell barren to the ground. A botanical friend, who had amused

Nº 52.

himself with observing this phenomenon with me, persuaded me to bring from the stove in the garden a single male flower, which he placed over one of the female ones, then in perfection, tying a piece of red silk round its pistillum. The next day the male flower was taken away, and this single seed-bud remained and bore fruit. Afterwards I took another male flower out of the same stove, and with a pair of slender forceps pinched off one of its antheræ, which I afterwards gently scratched with a feather, so that a very small portion of its pollen was discharged upon one of the three stigmata of a female flower, the two other stigmata being covered with paper. This fruit likewise attained its due size; and on being cut transversely, exhibited one cell filled with a large seed, and the other two empty. The rest of the flowers, being unimpregnated, faded and fell off. This experiment may be performed with as little trouble as the former.

"The *Datisca cannabina* came up in my garden from seed ten years ago, and has every year been plentifully increased by means of its perennial root. Flowers in great number have been produced by it; but being all female, they proved abortive. Being desirous of procuring male plants, I obtained more seeds from Paris. Some more plants were raised; but these likewise, to my great mortification, all proved females, and bore flowers, but no fruit. In the year 1757, I received another parcel of seeds. From these I obtained a few male plants, which flowered in 1758. These were planted at a great distance from the females; and when their flowers were just ready to emit their pollen, holding a paper under them, I gently shook the spike or panicle with my finger, till the paper was almost covered with the yellow powder. I carried this to the females, which were flowering in another part of the garden, and placed it over them. The cold nights of the year in which this experiment was made, destroyed these datiscas, with many other plants, much earlier than usual. Nevertheless, when I examined the flowers of those plants which I had sprinkled with the fertilizing powder, I found the seeds of their due magnitude; while in the more remote datiscas, which had not been impregnated with pollen, no traces of seeds were visible.

"Several species of *Momordica*, cultivated with us, like other Indian vegetables, in close stoves, have frequently born female flowers; which, although at first very vigorous, after a short time have constantly faded and turned yellow, without perfecting any seed, till I instructed the gardener, as soon as he observed a female flower, to gather a male one and place it above the female. By this contrivance we are so certain of obtaining fruit, that we dare pledge ourselves to make any female flowers fertile that shall be fixed on.

"The *Jatropha urens* has flowered every year in my hot-house; but the female flowers coming before the males, in a week's time dropped their petals, and faded before the latter were opened; from which cause no fruit has been produced, but the germina themselves have fallen off. We have therefore never had any fruit of the *jatropha* till the year 1752, when the male flowers were in vigour on a tall tree at the same time that the females began to appear on a small *jatropha* which was growing in a garden-pot. I placed this pot under the other tree, by which means the female flowers

flowers bore seeds, which grew on being sown. I have frequently since amused myself with taking the male flowers from one plant, and scattering them over the female flowers of another, and have always found the seeds of the latter impregnated by it.

“Two years ago I placed a piece of paper under some of these male flowers, and afterwards folded up the pollen which had fallen upon it, preserving it so folded up, if I remember right, four or six weeks, at the end of which time another branch of the same *Jatropha* was in flower. I then took the pollen, which I had so long preserved in paper, and strewed it over three female flowers, the only ones at that time expanded. These three females proved fruitful, while all the rest which grew in the same bunch fell off abortive.

“The interior petals of the *Orrithogalum*, commonly, but improperly, called *Canadense*, cohere so closely together, that they only just admit the air to the germen, and will scarcely permit the pollen of another flower to pass: this plant produced every day new flowers and fruit, the fructification never failing in any instance; I therefore, with the utmost care, extracted the antheræ from one of the flowers with a hooked needle; and, as I hoped, this single flower proved barren. This experiment was repeated about a week after with the same success.

“I removed all the antheræ out of a flower of *Cheledonium corniculatum* (scarlet horned poppy), which was growing in a remote part of the garden, upon the first opening of its petals, and stripped off all the rest of the flowers; another day I treated another flower of the same plant in a similar manner, but sprinkled the pistillum of this with the pollen borrowed from another plant of the same species: the result was, that the first flower produced no fruit, but the second afforded very perfect seed. My design in this experiment was to prove, that the mere removal of the antheræ from a flower is not in itself sufficient to render the germen abortive.

“Having the *Nicotiana frutescens* growing in a garden-pot, and producing plenty of flowers and seed, I extracted the antheræ from a newly-expanded flower before they had burst, at the same time cutting away all the other flowers; this germen produced no fruit, nor did it even swell.

“I removed an urn, in which the *Asphodelus fistulosus* was growing, to one corner of the garden, and from one of the flowers which had lately opened I extracted its antheræ; this caused the impregnation to fail. Another day I treated another flower in the same manner: but bringing a flower from a plant in a different part of the garden, with which I sprinkled the pistillum of the mutilated one, its germen became by that means fruitful.

“*Ixia chinensis*, flowering in my stove, the windows of which were shut, all its flowers proved abortive. I therefore took some of its antheræ in a pair of pincers, and with them sprinkled the stigmata of two flowers, and the next day one stigma only of a third flower; the seed-buds of these flowers remained, grew to a large size, and bore seed; the fruit of the third, however, contained ripe seed only in one of its cells.

“To relate more experiments would only be to fatigue the reader unnecessarily. All nature proclaims the truth I have endeavoured to inculcate, and every

flower bears witness to it. Any person may make the experiment for himself, with any plant he pleases, only taking care to place the pot in which it is growing in the window of a room sufficiently out of the reach of other flowers; and I will venture to promise him, that he will obtain no perfect fruit, unless the pollen has access to the pistillum.”

SECT. VI. *Of the Natural Method of Classification.*

BEST OF all the abovementioned methods of classing and distributing plants into their different orders, genera, &c. which are deduced from the fructification, and are therefore called *artificial*, Linnæus and most other botanists are of opinion that there is a natural method, or nature's system, which we should diligently endeavour to find out. That this system, say they, is no chimera, as some imagine, will appear particularly from hence, That all plants, of what order soever, show an affinity to some others; and thus, as formerly observed, not only the virtues of a great number of species may be ascertained, but we may know with certainty how to find a proper succedaneum for plants which cannot easily be had.—Linnæus divides vegetables into the 58 natural methods following.

1. *Palme*. These are perennial, and mostly of the shrub and tree kind. The stem is in height from 2 to 100 feet and upwards. The roots form a mass of fibres which are commonly simple and without any ramifications. The stem is generally simple, without branches, cylindrical, and composed of strong longitudinal fibres. The leaves, which are a composition of a leaf and a branch, by Linnæus called *frondes*, are of different forms; being sometimes shaped like an umbrella or fan; sometimes singly or doubly winged; the small or partial leaves, which are often three feet in length, being ranged alternately. The branches, or principal leaves, are six, eight, ten, or twelve feet long; the length varying according to the age and size of the plant. They are covered at first with a thick brown duit, like those of the ferns. The base of the leaves frequently embraces the greater part of the stem. The flowers are male and female upon the same or different roots; except in stratiotes, which bears hermaphrodite flowers only; and palmetto, in which the flowers are hermaphrodite and male upon distinct roots. The flowers are all disposed in a panicle or diffus'd spike, except in the hydrocharis, stratiotes, and villisericia; in which they proceed singly from the wings or angles of the leaves. The common calyx, in this order, is that termed a *perianth* or *sheath*, and has either one or two valves. The spadix, or head of flowers protruded from the sheath, is generally branched. Each flower is generally furnished with a perianthium or proper flower-cup, consisting of three leaves or divisions that are small and permanent. The petals are three in number, of a substance like leather, and permanent like the leaves of the calyx. The flowers of zania have no petals. The stamina are from 2 to 20 and upwards, cohering slightly at their base. The seed buds are from one to three in number, placed in the middle of the flower, and supporting a like number of styles which are very short. The seed-vessel is generally a pulpy fruit of the berry or cherry kind, containing one cell filled with fibrous flesh, and covered with a skin which is of a substance

like leather. The seeds are in number from one to three in each pulpy fruit, of a hard bony substance, round or oval, and attached by their base to the bottom of the fruit.—These plants, particularly the feeds, are astringent, and of efficacy in dysenteries.

2. *Piperitæ*. These plants are mostly herbaceous and perennial. The stalks of pothos creep along rocks and trees, into which they strike root at certain distances. The greatest height which any of them is known to attain is 15 feet; the greater part do not exceed three or four. The fleshy roots of many of these plants are extremely acrid when fresh. They lose this pungent quality, however, by being dried, and become of a soapy nature. The smell of many of them is extremely fetid, frequently resembling that of human excrements. The flowers, however, of an Ethiopian dracunculæ or arum, and the cover in which they are involved, are said to emit a very fragrant odour. With regard to their virtues, these plants are commonly astringent.

3. *Calamariæ*. In this class the base of the leaf, which embraces the stalk like a glove, has no longitudinal aperture, but is perfectly entire. The stalk is generally triangular, and without knots or joints. The roots of some are long and knotty; in others they are composed of fleshy fibres which pierce deep into the ground; and in others, of a bulb. The flowers are either hermaphrodite, or male and female upon the same root. The mode of inflorescence in this order is generally a spike; sometimes a capitulum or head. The calyx is either a glama or anamentum. The corolla is wanting. The filaments of the stamina are three in number, short, slender like a hair, and sometimes bristly. The anthers are generally long, slender, and erect. The seed-bud is very small, blunt, and sometimes three-cornered. The style is thread-shaped, and of the length of the fealy calyx. The stigmata are generally three in number; slender, hairy, and sometimes permanent. The virtues, uses, and sensible qualities, of this order of plants are the same with those of the following.

4. *Graminæ*. Most of these plants are annual or perennial herbs; some of them creep upon the ground, others are erect. The roots, in the greatest number, are creeping, and emit fibres from each knot or joint; in others they are simply branching and fibrous. The stems and branches are round. The leaves are simple, alternate, entire, very long, and commonly narrow. They form below a sort of sheath, which embraces or surrounds the stem, and is generally cleft or divided on one side through its whole length. The flowers are either hermaphrodite, male and female on the same root, or hermaphrodite and male on the same root. They proceed either singly from the sheath of the leaves, or are formed into a panicle or loose spike. The calyx and corolla in this order are not sufficiently ascertained; in some a single scale or husk, in others two, supply the place of both covers; some grasses have four husky scales, two of which serve for the calyx, and the other two for the corolla; some have five; others six, four of which constitute the calyx, and the other two are termed improperly enough the *husky petals*. The corolla is sometimes composed of one petal with two divisions; and in general the husks of the calyx are always placed opposite to those of the corolla. The stamina are generally three in number, and placed irregularly with re-

gard to the situation of the calyx and corolla. The anthers are long, furnished with two cells, and slightly attached to the filaments. The seed-bud is placed upon the same receptacle as the calyx, corolla, and stamina. The style is generally double, and crowned with a hairy stigma or summit. The seed-vessel is wanting. The feeds are single, oval, and attached below to the bottom of the flower.—The roots of the grasses are opening; such as have an aromatic smell are stomachic; their feeds are mealy, mucilaginous, and nourishing. All the parts of these plants are wholesome.

5. *Tripetalicidæ* (from *tres*, three; and *petalum*, a petal). These plants have no very striking characters, and are nearly allied to the grasses. All the genera of this order have not the circumstance expressed in the title.

6. *Erythæ*. This order, which is very nearly allied to the grasses and liliaceous plants, furnishes a very beautiful collection of perennial herbs, which are of different heights, from one inch to 15 feet. The roots are tuberous or fleshy, and garnished with fibres; the stalks are simple, and commonly flat or compressed on the sides. The leaves are simple, alternate, entire, sword shaped, and, like the liliaceous plants, form at their origin a sheath or glove, which in the greatest number is cleft or divided through the whole length, except at the base, where it is entire, and embraces the stalk like a ring. The flowers are hermaphrodite, and generally proceed from the summit of the stalks either singly, in an umbel, a spike, or in a panicle. In pentandria they proceed from the wings or angles of the leaves either singly or in an umbel. Most of these plants want the perianthium or flower-cup; the flowers burst from a common cover or sheath, termed by Linnæus *spatha*, which in this order is frequently permanent. The petals are in number from one to six. The stamina are generally three. The seed-bud is placed sometimes above the flower, sometimes below it. The style is generally single, and crowned with a triple stigma. The seed-vessel is a dry capsule, generally of an oblong shape, and opens at three valves, discovering the same number of cells, each inclosing a quantity of roundish seeds.—These plants resemble the liliaceous in their powers and sensible qualities; very few of them, however, are used in medicine.

7. *Orchidæ*. The roots of many of these plants are composed of one or more fleshy tubercles or knobs, attached to the lower part of the stem, and sending forth fibres from the top. Those of orchis bear an obvious resemblance to the scrotum in animals: from which circumstance the genus has derived its name. The leaves are of a moderate size, inscribed with a number of longitudinal nerves or ribs, and without any footstalk. At their origin they form round the stalk a kind of sheath, which is long, entire, cylindrical, but not furnished, like the grasses and some other plants, with a crown at top. The flowers are hermaphrodite, and placed at the summit of the stalk either in a spike or in a panicle. The calyx is that sort termed by Linnæus a *spatha* or *sheath*, that bursting open protrudes a head or cluster of flowers, termed the *spadix*, which have no perianthium or flower-cup. The petals are five in number, and very irregular. The nectarium in this order is remarkably conspicuous; yet so different in the different genera, that Linnæus has employed it for his principal character or mark of

distinction, instead of the root, which had chiefly engaged the attention of former botanists. It has the appearance of a sixth petal. The filaments are always two in number, and placed upon the pistillum or female organ. The anthers are erect, and generally covered by the upper lip of the nectarium. The seed-bud is either oblong or pillar-shaped, twisted like a screw, and universally placed below the receptacle of the flower. The style is single, very short, and forms one substance with the inner margin of the nectarium. The seed-vessel is generally a capsule with one cavity or cell, and three valves or openings, which are keel-shaped, and open on the angular sides, being jointed both at the bottom and top. The seeds are numerous; very small, like saw-dust; and attached, without footstalks, to a slender receptacle or rib, which extends itself lengthwise in the middle of each inclosure or valve. The plants of this order are reckoned strong aphrodisiacs.

8. *Scitamineæ*. This class consists of beautiful exotic plants, all natives of very warm countries. Some of them furnish exquisite fruits; but though the plants rise very high, they are perennial only by their roots. Those which have only one filament, have in all their parts an aromatic odour, and an acid or poignant taste; qualities, however, possessed in a much greater degree by the roots, which are hot and resinous.

9. *Spathaceæ*, so called because their flowers are protruded from a *spatha* or sheath. They are nearly allied in habit and structure to the liliaceous plants, from which they are chiefly distinguished by the *spatha* out of which their flowers are protruded.

10. *Cornariæ*. These plants are herbaceous, perennial, and from one inch to 15 feet high. The roots are either bulbous, fibrous, or composed of small fleshy knots, which are jointed at top. The bulbs either consist of scales laid over each other like tiles, or are solid. The stem of the liliaceous bulbous plants is properly wanting; what supplies its place being nothing else than the base of the leaves, which, wrapping or enfolding each other, form at bottom a roundish fleshy bulb hitherto distinguished, though perhaps improperly, by the name of *root*. In the others the stem is simple, that is, has few branches, and is either furnished with leaves, or rises naked. The branches are alternate and cylindrical. The leaves are simple, alternate, and entire. Those next the root, termed *radical leaves*, generally form at their origin a sheath, which in a great number is entire; that is, goes all round; whilst in others, it is cleft or divided longitudinally on one side. The flowers are universally hermaphrodite, except in white hellebore, which has both male and hermaphrodite flowers mixed together on the same root. The flowers are sometimes single, and terminate the stem; sometimes they form an umbel, sometimes a spike, and sometimes a panicle. The calyx or flower-cup, in this order, according to Linnæus, is generally wanting. In strict propriety, however, the single cover that is present in most of these plants, though beautifully coloured, ought to be denominated a *calyx*; as its divisions, generally six in number, are placed opposite to the stamina. The petals, or, to speak more properly, the coloured leaves of the flower, are in number from one to six. Plants which have a single petal, have the limb or upper part split into six divisions or segments. The petals in some

species are rolled or turned back. The nectarium is various; in the lily it is a longitudinal line which runs through each petal, and reaches to the base to the middle. In crown imperial, it is a small hollow or pore, formed at the base of each petal; in asphodel it consists of six very small valves, which, approaching, form a globe, and are inserted into the base of the petal; in hyacinth, it is composed of three melliferous pores, situated on the top of the seed-bud. In pine-apple, it is a small scale lying within the substance of each petal above the base; and in alluica, or ballard star of Bethlechem, it consists of two sharp-pointed bodies proceeding from the furrows of the seed-bud, and covered by the broader base of the three fertile filaments. In some species of lily the nectarium is hairy; in others it is naked. The stamina are six in number; erect, and inserted into the common receptacle, if the flower consists of many petals; into the tube, or divisions of the corolla, if it consists of one. The anthers are long, commonly divided below, and slightly attached by their sides to the filaments on which they turn like a vane or the needle of a compass. The seed-bud is single, and placed either within the flower-cup or below it. The style is single, thread-shaped, and generally of the length of the petals. The stigma is generally single, of a conic form, and shaggy or hairy at the extremity. The seed-vessel is generally a capsule, divided externally into three valves, internally into three cells.—With respect to the powers of the plants of this order, it may be affirmed in general, that such as have little taste or smell, as the roots of tulip, and star of Bethlechem, are perfectly innocent; whilst those which have a heavy nauseous smell, as squill, hyacinth, crown imperial, and spider-wort, are at least suspicious, and frequently prove noxious.

11. *Sarmentosæ*, (from *sarmentum*, a long shoot, like that of a vine.) This order consists of plants which have climbing stems and branches, that, like the vine, attach themselves to the bodies in their neighbourhood for the purpose of support. These plants are far from being a true natural assemblage; in fact they scarce agree in a single circumstance, except that expressed in the title, which is far from being peculiar to this order.

12. *Holeracæ*. This order consists of plants which are used for the table, and enter into the economy of domestic affairs: it contains trees, shrubs, perennial, and annual herbs. Some of the woody vegetables retain their green leaves during the winter. The roots are very long, and frequently spindle-shaped; from the knots on the stems and branches of such plants as creep on the ground, or float on the water, proceed fibrous and branching roots. The stems and young branches are cylindric; and in the greater part of the aquatic plants of this order, the stalks are hollow within. The buds are of a conic form, and naked; that is, not accompanied with scales. The leaves are generally simple, entire, alternate, and attached to the branches by a cylindric foot-stalk, which is sometimes very long, but commonly very short. Some plants of this kind have two stipule or scales which are attached to the branches near the origin of the foot-stalk of each leaf. In many others, instead of stipule, each leaf bears on its foot-stalk a membranaceous sheath, which is cylindric, frequently fringed on the margin, and pierced or penetrated

trated by the stem. The flowers are either hermaphrodite; male and female upon the same root; male and female upon different roots; hermaphrodite and male on the same root; or hermaphrodite and female on the same root; or hermaphrodite and male on different roots.

13. *Succulentæ*. This order consists of flat, fleshy, and juicy plants, most of them ever-greens. They are astringent, refreshing, and very wholesome.

14. *Grinales* (from *grus* a crane). These consist of *geranium*, vulgarly called *cranes-bill*, and a few other genera which Linnæus considers as allied to it in their habit and external structure. This order furnishes both herbaceous and woody plants. The roots are sometimes fibrous, sometimes tuberous. In some species of wood-ferrel they are jointed. The stems are cylindrical; the young branches, in some, nearly square. The buds are of a conic form, and covered with scales. The leaves are either simple or compound. The flowers are hermaphrodite; they proceed from the wings of the leaves either singly or in clusters. The calyx or flower-cup consists of five distinct leaves, or of one leaf divided almost to the bottom into five parts. It generally accompanies the feed-bud to its maturity. The petals are five in number, spreading, and frequently funnel-shaped. The stamina are generally ten in number, awl-shaped, erect, and of the length of the petals. The stamina are generally oblong; and frequently attached to the filaments by the middle, so as to lie, and sometimes to veer about, upon them. The feed-bud is either oblong or five-cornered. The number of styles is either one or five. In *tribulus*, the style is wanting. The feed-vessel is generally a five-cornered capsule, with one, three, five, or ten cells. The seeds are generally equal in number to the internal divisions or the cells of the feed-vessel; one seed being placed in each cell.

15. *Inundatæ*. The plants of this order are aquatic, of low stature, herbaceous, and mostly perennial. The roots are fibrous. The stem is generally wanting. In its place are an assemblage of leaves, which wrapping or unfolding each other mutually form a sheath; and from the middle of this sheath is produced the foot-stalk of the flower. The leaves are sometimes alternate, sometimes placed in whorls round the stem. In a great many genera the foot-stalk is extended at its origin into a membranaceous substance, which forms a sheath that is cleft through the whole length, on the side opposite to the leaf. The flowers are hermaphrodite, or male and female on the same root. The flower-cup is either wanting, or consists of three, four, or five divisions or leaves, which accompany the feed-bud to its maturity. The petals are generally wanting. The stamina are in number from 1 to 16 and upwards. The filaments in some genera are so short, that they seem wanting. The antheræ are short, and generally marked with four longitudinal furrows. The feed-buds are in number from one to four, the style is frequently wanting. The feed-vessel is universally wanting, except in *Elatine*, which has a dry capsule, with four external openings, and the same number of cells. The seeds are generally four in number.

16. *Calycifloræ*, (from *calyx* the flower-cup, and *flos* the flower), consisting of such plants as have the stamina (the flower) inserted into the calyx. All the plants

of this order are of the shrub and tree kind. Some of them rise to the height of 12 or 14 feet; others not above two or three. The roots are branching, fibrous, and woody. The stems are cylindrical. The branches, when young, are cornered; the buds of a conic form, and without scales. The leaves are simple, alternate, and attached to the branches by a very short foot-stalk. The flowers are either male or female upon distinct roots, or hermaphrodite and male on the same root. The calyx is a perianthium composed of one leaf divided into two, three, or four segments. It is commonly placed upon the germen or feed-bud, which accompanies it to maturity. The corolla is universally wanting, except in *trophis*, the male plants of which, according to Linnæus, have four obtuse and spreading petals. The stamina are generally four in number, slender like a hair, short, placed at a considerable distance from the style, and inserted into the tube of the calyx. The pistillum is composed of a roundish germen, crowned with the calyx; a single thread-shaped style; and a cylindrical stigma. The feed-vessel is either an obtuse oval fruit of the cherry kind, or a globular berry with one cell, containing a roundish seed. The plants of this order are astringent.

17. *Calycanthemæ*, (from *calix* the flower-cup, and *anthos* the flower); consisting of plants, which, among other characters, have the corolla and stamina inserted in the calyx. This order furnishes trees, shrubs, and annual, biennial, and perennial herbs. The herbaceous annuals are by much the most numerous. The roots are branching and fibrous; the stems and branches cylindrical, square, or four-cornered while young. The buds are of a conic form, and without scales. The leaves are generally either alternate, simple, and attached to the branches by a short foot-stalk, or opposite at the bottom of the stem; and in some, alternate towards the top. They are universally sessile; that is, attached to the branches, without any foot-stalk. The calyx is universally a perianthium, and generally monophyllous, or composed of one leaf. The corolla consists of four, five, and six petals, which are attached to the tube of the calyx, and are sometimes placed alternate, sometimes opposite, to the divisions of the limb. The stamina, which are in number from 4 to 20 and upwards, are attached to the tube of the calyx either on its margin or lower down. When the number of stamina is double the divisions of the calyx, the stamina which stand opposite these divisions are a little longer than the rest. The antheræ are generally of a hemispherical figure; frequently cleft or slit below; and by that aperture attached slightly to the filaments, on which they often veer about like a vane or needle. They are surrounded longitudinally, and open on the sides into two loculi or cells. The pollen, or male dust, consists of a number of minute particles, of an oval figure, yellow and transparent. The germen or feed-bud, is placed either above or under the receptacle of the flower. The style is single, thread shaped, and of the length of the stamina. The stigma is generally single and undivided. The feed-vessel is a capsule, which is generally divided internally into four loculi or cells. The seeds are numerous, minute, and frequently three-cornered. The plants of this order are reckoned astringent.

18. *Bicornes*, (from *bis* twice, and *cornu* a horn), plants whose antheræ have the appearance of two horns.

This

This appearance, however, is not very conspicuous, unless in a few genera. The plants of this order are all of the shrub and tree kind. The roots are branching and fibrous. The stems and branches are cylindrical. The buds conic, sometimes covered with scales, and sometimes naked. The leaves are generally alternate. In most plants of this order they are either sessile, or supported by a very short foot-stalk, which is semi-cylindric, and flat above. The flowers are universally hermaphrodite, except in one genus, the Indian date-plumb, where hermaphrodite and male flowers are produced in the same species upon distinct roots. They proceed either solitary, or in a corymbus from the angles formed by the leaves and branches; or hang down in spikes and clusters at the end of the branches; each flower having a small scale or floral leaf placed under it. In most plants of this order the calyx is placed around or below the germen. The calyx is universally a perianthium, and generally monophyllous or of one piece, deeply divided into four or five segments, which are permanent, that is, accompany the germen to its maturity. The segments are often acute, and sometimes coloured. The corolla is generally monopetalous, and bell or funnel shaped; the figure, however, is not very constant, even in plants of the same genus. The limb, or upper part of the petal, is generally divided into four or five segments, which are sometimes rolled back, sometimes bent inwards. The limb too is sometimes slightly cut, sometimes divided almost to the bottom. The tube, or lower part of the petal, is cylindrical, and generally of the same length with the calyx. The number of stamina is from 4 to 20. These are generally erect, and attached to the lower part of the tube of the corolla. The antheræ are bifid or forked below, and, being slightly attached to the filaments, are frequently inverted in such a manner as to exhibit the appearance of two horns at top. The germen or seed-bud, is generally roundish, and seated above the receptacle. The style is single, thread-shaped, of the same length with the corolla, and in a few genera permanent. The seed-vessel is either a capsule with five cells, a roundish berry, or an oblong four cornered nut with two cells. The plants of this order are astringent.

19. *Hesperideæ*, (from the Hesperides, whose orchards are said to have produced golden apples). The plants of this order are of the shrub and tree kind, and mostly evergreen. The bark of the stalks is slender, and comes off in thin plates. The leaves are generally opposite, and covered with small transparent points. In some, the leaves are placed opposite at the bottom of the stalks, and alternate above. The buds are of a conic form, the flowers generally hermaphrodite; they proceed from the wings of the leaves either singly, or in clusters like ivy-berries. The calyx is placed above the seed-bud, and accompanies it to its maturity. The petals are three, four, or five in number, and stand upon the brims of the tube of the calyx. The seed-bud is large, oblong, and placed below the receptacle of the flower. The style is single, awl-shaped, of the length of the stamina, and terminated with a bare stigma. The seed-vessel in some genera is a berry furnished with one or three cells; a capsule with four cells, or of the nature of a cherry, containing a stone. The seeds are generally numerous, small and oblong. The leaves and fruits, are astringent, the berries astringent.

20. *Rotaceæ*, (from *rota*, a wheel), consisting of plants with one wheel-shaped petal without a tube. These resemble in quality those of the order of pænie, to which they are in all respects very nearly allied; but very few of them can be said in strict propriety to possess the character specified in the title.

21. *Pænieæ*, (from *pænicus* early). These consist of primrose, an early flowering plant, and some others which agree with it in habit and structure, though not always in the character or circumstance expressed in the title. These plants, which possess no striking uniform characters, are, in general, innocent in their quality; yet the root of sow-bread is dangerous, if taken internally.

22. *Garyophylleæ*. All the plants of this order are herbaceous, and mostly annual. Some of the creeping kinds do not rise above an inch, and the tallest exceed not seven or eight feet. The roots are branching, fibrous, and of a moderate length. The stems are cylindrical. The branches proceed from the wings or angles of the leaves, and are generally opposite, and as it were jointed at each knot. In some species of cerasium the branches are square. The leaves are generally placed opposite in pairs, so as to resemble a cross; and are slightly united at the bottom by their foot-stalks, which form a sort of glove round the stem. The hairs are simple, like silk. The flowers are hermaphrodite; but some have male and female flowers upon distinct roots. They either stand single on their foot-stalks, and proceed from the wings or angles of the leaves and branches, or are disposed in a spike, corymbus, umbel, or panicle. The calyx is permanent, and composed either of one piece with five indentments, or of four or five distinct leaves. The corolla generally consists of five petals, which have claws of the length of the calyx; and a spreading limb, sometimes entire, but oftener cleft or divided in two. The stamina are in number from 3 to 15, and of a moderate length. When their number is double the divisions of the calyx, they are attached alternately to the claws of the petals, those so attached being shorter than the rest; the remaining stamina are inserted into the common receptacle, and stand opposite to the segments of the calyx. In some genera of this order the number of stamina is found to vary, even in the different flowers of the same plant. The antheræ are short, hemispherical, marked with four longitudinal furrows, frequently divided or cleft below, most commonly erect; sometimes, however, *incumbent*, that is, fastened to the filaments by the sides. The pointal is composed of a single seed-bud, which is generally roundish, sometimes cornered. The styles are thread-shaped, of the length of the stamina, and crowned with a simple stigma, which is sleek or smooth externally, and slightly hollowed or vaulted within. The seed-vessel is a dry capsule, of an oval form of the length of the calyx, and consist of one or three cells. The plants of this order are innocent in their quality; they abound in a watery sort of plegm, and have bitter seed. With respect to their virtues, they are reckoned astringent, attenuating, and detesive.

23. *Tribulateæ*, (from *tres* three, and *latus* an external mark on the seed); consisting of plants with three seeds, which are marked distinctly with an external cicatrix or scar, where they were fastened within to the fruit.

24. *Corydalis*, (from *κorymbos* a helmet); consisting of plants which have irregular flowers, somewhat resembling a helmet or hood. These plants are mostly herbaceous and perennial. The roots are tuberous or knobby. The stems are generally branching. The leaves are alternate, sometimes simple, but most commonly winged. The foot-stalk of the leaves is flat or narrow, except in *epimedium*, where it is large, and has a membranous edge or border. The flowers are universally hermaphrodite. They proceed either singly from the wings or angles of the leaves, or are collected in clusters at the end of the branches. The calyx consists of two, four, five, or six leaves, which are frequently coloured, and commonly fall off immediately before, or very soon after, the expansion of the petals. The corolla is generally irregular; of one, or many pieces; gaping; and furnished with a nectarium, which is very different in the different genera. The stamina are in number from two to six, and of a proportionate length, except in honey-flower, which has two shorter than the rest. The filaments are distinct, except in two genera, fumitory and *monniera*, which have two sets of strings or filaments united in a cylinder. The antheræ are universally distinct, except in *impatiens*, where they are formed into a cylinder divided at the base. The seed-bud is generally roundish, but sometimes angular or cornered. The style is commonly single, extremely short, slender, or thread-shaped, and crowned with a simple stigma. The seed-vessel is either a hollow blown-up berry, a capsule of one cell, a longish, or a roundish pod. The seeds are generally numerous and round.

25. *Putamineæ*, (from *putamen* a shell); consisting of a few genera of plants allied in habit, whose fleshy seed-vessel or fruit is frequently covered with a hard woody shell. Most of these plants are acid and penetrating; and yield, by burning, a great quantity of fixed alkali. With respect to their virtues, they are powerful aperients. The Indians pretend that the fruit of a species of caper-bush, which they call *balucca*, extinguishes the flames of love.

26. *Multifloræ*, (from *multus* many, and *siliqua* a pod); consisting of plants which have more seed-vessels than one. From the etymology of the term, one would naturally imagine that the seed-vessels in question were of that kind called by Linnæus *siliqua*, or pod: but the fact is, that not a single plant of this order bears pods; the greater part having many dry capsules, and the remainder being furnished properly with no seed-vessel, but bearing numerous distinct seeds. Plants of this order are mostly perennial herbs; the stems of some are erect; others creep upon the ground, and produce roots near the origin of each leaf; lastly, others climb, and attach themselves to the bodies in their neighbourhood, either by the footstalk of the leaves, or by tendrils and clasps which terminate the footstalk. The greatest height of those which rise erect, seldom exceeds eight feet. Those which climb rarely exceed 15 or 20 feet. The roots are generally fleshy. In some they are hand-shaped; in others finger-shaped, or cylindrical. In some species of hellebore and ranunculus they are divided into spherical knobs. Lastly, in some plants of this order, the roots are fibrous. The stems and young branches are cylindrical. The leaves,

which are of different forms, being sometimes simple and entire, sometimes hand-shaped or winged, are generally alternate. The footstalk, which is sometimes cylindrical, sometimes angular, is membranous, and very large at its origin, surrounding a great part of the stem from which it proceeds. The flowers are hermaphrodite. They proceed either singly from the wings of the leaves or termination of the branches, or terminate the branches in a spike, panicle, or head. The calyx in some is wanting; in others it is generally composed of five pieces, which fall off with the petals. The petals are in number from 4 to 15; generally equal, and sometimes disposed in two or three series; five is the prevailing number. The stamina are in number from 5 to 300, distinct, and attached generally in several rows or series to the receptacle. The seed-buds are generally numerous; the style is frequently wanting. In some the seed-vessel is wanting; in others it is composed of several dry capsules, each containing a single cell. The seeds are numerous, and frequently angular. Most of these plants are acid, and many of them poisonous. In general, plants that have a great number of stamina are noxious in their quality. When burnt, these plants furnish a fixed alkali; by distillation there is drawn from them a kind of nitrous and aluminous substance. With respect to their virtues, they are caustic and purgative.

27. *Rhæadææ*, consisting of poppy, and a few genera which resemble it in habit and structure. These plants, upon being cut, emit plentifully a juice, which is white in poppy, and yellow in the others. With respect to their virtues, they seem to operate principally upon the nerves. Their juice is soporific and narcotic, their seeds less so, their roots aperient. Applied externally, they are slightly corrosive.

28. *Lyciæ*, consisting of plants whose pale and ominous appearance seems to indicate something baleful and noxious in their natural quality. Most of these plants are herbaceous and perennial. Many of them are of the malqued tribe of flowers; others resemble these in their general appearance, but differ from them essentially in the equality of their stamina. The roots are generally branched, sometimes tuberous. The stems and branches are cylindrical. The leaves are generally simple, and placed alternate. The flowers are hermaphrodite. They proceed either singly or in clusters from the angle formed by the leaves and branches. In some species of lycium, they terminate the branches. The calyx is generally of one piece deeply divided into five parts. The corolla consists of one petal, which is either bell, funnel, or wheel shaped. The stamina are four or five in number; and those either of equal lengths, as in the greater, or unequal. The seed-bud is placed above the receptacle of the flower. The style is single; and is terminated by a summit which is hemispherical, and frequently channelled or furrowed. The seed-vessel, in such as have equal stamina, is a berry; in the rest, it is generally a capsule. The seeds are numerous, and frequently kidney-shaped.—These plants in general are poisonous. They have an insipid taste, and a nauseous disagreeable smell.

29. *Campanacææ*, (from *campana* a bell); plants with bell-shaped flowers. The plants of this order are herbaceous and perennial. The roots are either spindle-shaped,

shaped, or branching and fibrous. The stems are round. The branches are generally alternate. The leaves are simple, alternate, and commonly attached to the branches by a semi-cylindric foot-stalk, which is furrowed above. The indentments are terminated by a small white tubercle or knob, which renders them conspicuous. The flowers are hermaphrodite; and proceed either solitary from the wings of the leaves, or are collected into a spike and head at the end of the flower-stalk. The calyx is universally a perianthium situated upon or round the germen, and generally composed of one leaf deeply divided into five segments. The corolla is monopetalous, and of the bell, funnel, or wheel shape. The tube, in flowers of the bell and wheel shape, is very short; in those of the funnel-shape, very long. In Greek valerian, the tube is shut with five valves, which are placed on its apex or top. The limb or upper part of the corolla is deeply divided into five segments, which spread, and are alternate with the divisions of the calyx. The corolla is generally permanent. The stamina are five in number, attached to the base of the tube of the corolla, alternate with its divisions, and opposite to those of the calyx. The filaments are distinct; very large at their origin; and frequently approach so as to form a sort of vault, which covers the summit of the germen. They are slender and awl-shaped above. The anthers are very long; oval; marked with four longitudinal furrows, either distinct, or united in a cylinder. The pollen is composed of very small, spherical, white, shining, and transparent particles. The germen is roundish, and situated either wholly or in part under the flower. The style is generally single, and of the length of the stamina or corolla. The stigma is commonly single, but deeply divided. The seed-vessel is a roundish capsule, generally divided into three cells, and furnished externally with the same number of valves. The seeds are small, numerous, attached to a receptacle in the centre of the fruit, generally rounded, and sometimes cornered.—This order furnishes many excellent medicines. The plants abound with a white milky juice, which, upon the stalk being cut, flows out in great quantities.

30. *Contortæ*, (from *con* together, and *torques* to twist); consisting of plants which have a single petal that is twisted or bent towards one side. This order furnishes trees, shrubs, and fat succulent plants, some of which retain their leaves during the winter. The herbaceous vegetables in this order are generally perennial. The roots are sometimes branching, but commonly fleshy, succulent, and garnished with fibres or strings like those of turnip. The stems are round and in some genera pulpy and succulent. The branches are sometimes placed alternate, and sometimes opposite. The buds are of a conic form, and naked or without scales. The leaves are sometimes alternate, sometimes placed opposite in pairs, and not seldom furrowed the stem in whorls. They are attached to the branches by a cylindrical foot-stalk, which is short, and frequently united to the foot-stalk of the opposite leaf. The defensive and offensive weapons in this order are a downy sort of pubescence, and simple, or forked prickles, which, in some genera, issue from the wings of the leaves. The flowers are hermaphrodite; and stand either singly upon their footstalks, or are collected into umbels and clusters. These bunches or collections of

flowers sometimes terminate the branches, sometimes proceed from the angles of the branches, and sometimes stand at the side of the wings without issuing from them. The flower-cup is composed of one leaf divided almost to the base in five unequal segments, which embrace each other, and are permanent, or accompany the seed-bud to its maturity. The corolla consists of one petal, which in the different genera is bell, salver, funnel, or wheel shaped. The limb, or upper spreading part of the petal, is generally divided into five equal parts, which are slightly bent or twisted to the left, and embrace or unfold each other like the petals of the mallow tribe. The tube is generally long and cylindrical; sometimes club-shaped, and oftentimes wanting. In several flowers of this order the petal is accompanied with that species of superfluity termed a *malvarium*. In the different genera, however, it assumes very different appearances. The stamina are five in number, short, equal, attached at the same height to the tube of the petal, alternate with its divisions, and opposite to those of the calyx. The anthers are generally erect, and frequently approach so as to form a compact body in the middle of the flower. The seed-bud is either single or double. In some the style is wanting. The stigma is frequently double. The seed-vessel in some genera is a pulpy fruit, of the berry and cherry kind; but most frequently that species termed by Linnæus *capsularium*, and *gibbularium*, which has one valve or external inclosure, opens lengthways on one side, and has not the seeds rattened to it. Two of these dry fruits, with a single cell, compose the seed-vessel of most plants of this order. The seeds are generally numerous, and in several genera crowned with a long pappus or downy wing like that of the compound flower; by means of which they easily disperse and sow themselves.—The plants of this order being cut, emit a juice which is generally milky, and sometimes of a greenish white. From the circumsitancy of their abounding in this milky juice, the greater part are deemed poisonous; repeated observations having established this aphorism, That milky plants, except those of the plain compound flowers, are generally of a baneful destructive nature, and ought at least to be administered with caution. With respect to their sensible qualities, they are bitter; particularly the feed roots, and bark, in which resides their principal virtue.

31. *Teprecule*, (from *repres* a briar or bramble), consisting of plants resembling the daphne, direa, gauldia, &c. but which, however, do not constitute a true natural assemblage.

32. *Papilionaceæ*, plants that have papilionaceous flowers, i. e. somewhat resembling a butterfly in shape, of which number are all the leguminous plants. The plants of this order are of very different duration; some of them being herbaceous, and those either annual or perennial; others woody vegetable, of the shrub and tree kind, a few of which rise to the height of 70 feet and upwards. The herbaceous plants of this order generally climb; for, being weak and as it were helpless of themselves, they are provided by nature with tendrils, and even sharp-pointed hooks, at their extremities, to fasten upon the neighbouring trees or rocks, or the stalks are endowed with a faculty of twirling themselves, for the purpose of support, around the bodies in their neighborhood. The pea, vetch, and kidney-

ney bean, afford familiar examples of this appearance. The shrubs and trees of this order are mostly armed with strong spines. The roots are very long, and furnished with fibres; but some genera have fleshy knobs or tubercles placed at proper intervals along the fibres. The stems are cylindrical, as likewise the young branches, which are placed alternately: those which climb, twist themselves from right to left, in a direction opposite to the apparent motion of the sun. The bark of the large trees is extremely thick and wrinkled, so as to resemble a net with long meshes; the wood is very hard in the middle, and commonly coloured or veined. The buds are hemispherical, without scales, and proceed from the branches horizontally a little above the angle which they form with the leaves. The leaves are alternate, and of different forms, being either simple, finger-shaped, or winged. This last form is very common; the lobes or lesser leaves are entire, and sometimes placed in pairs, but most commonly the winged leaf is terminated by an odd lobe. The winged or pinnated leaves of this order have a daily or periodical motion, depending upon the progress of the sun in his diurnal course. The common footstalk of the winged and compound leaves is marked on the upper surface with a cavity or furrow which runs through its whole length. The flowers are hermaphrodite; and proceed either from the wings of the leaves, or from the extremity of the branches. The calyx is a perianthium of one leaf, bell-shaped, bunching out at the bottom, and cut on its brim or margin into five irregular divisions or teeth; the lowermost of which, being the odd one, is longer than the rest: the other four stand in pairs, of which the uppermost is shortest, and stands farthest asunder. The bottom of the calyx is moistened with a sweet liquor like honey, so may be deemed the nectarium of these plants. The petals are four or five in number, very irregular, and from their figure and position bear an obvious resemblance to a butterfly expanding its wings for flight. These petals have been characterized by distinct names: the upper one, which is commonly the largest, is termed the *standard*, (*vesillum*); the two side petals, the wings, (*alæ*); and the lowermost, which is generally united at top, and divided at bottom, the *keel*, (*carina*). The stamina are generally ten: these are either totally distinct, or united by the filaments into one or two bundles involving the seed-bud. In the latter case, where there are two sets of united filaments, one of the sets is composed of 9 stamina, which are united into a crooked cylinder, that is cleft on one side thro' its whole length: along this cleft lies the tenth filament or stamen, which constitutes the second set, and is often so closely attached to the second bundle, that it cannot be separated without some difficulty. The antheræ are small, round, marked with four longitudinal furrows, and slightly attached to the filaments. In lupine, the antheræ are alternately round and oblong. The seed-bud is single, placed upon the receptacle of the flower, oblong, cylindrical, slightly compressed, of the length of the cylinder of the united stamina by which it is involved, and sometimes elevated by a slender footstalk which issues from the centre of the calyx. The style is single, slender, and generally crooked or bent. The stigma is commonly covered with a beautiful down, and placed immediately under the antheræ. The seed-vessel is that sort of pod termed a *legume*, which is of an

oblong figure, more or less compressed, with two valves, and one, two, or more cavities. These cavities are often separated, when ripe, by a sort of joints. The seeds are generally few in number, round, smooth, and fleshy. Jointed pods have generally a single seed in each articulation. The seeds are all fastened along one suture, and not alternately to both, as in the other species of pod termed *siliqua*.—The plants of this family are, in general, mucilaginous. From the inner bark of most of them flows, either naturally or by incision, a clammy liquor, which dries and hardens like gum; the juice of others is sweet like sugar; some taste bitter, and are purgative, emetic, or even mortal. A species of eastern atragalus, with goats-rue leaves, is said to be remarkably caustic, and to burn the tongue excessively when chewed. In general, however, these plants are soft and clammy. With respect to their virtues, the plants of this order are highly emollient; some of them are vulnerary and astringent; and the root of anonis, or rest-harrow, is diuretic.

33. *Lomentaceæ*, (from *lomentum*, a colour used by painters). Many of these plants furnish beautiful tinctures, and some of them are much used in dyeing. They very much resemble the last order, differing only in the following particulars. 1. In all plants of this order, except milk-wort, the stamina are distinct. The flower is not shaped like a butterfly, but is less irregular, and frequently consists but of one petal. The leaves are sometimes simple, but most commonly winged. The seeds are commonly marked with a circular furrow on both sides. Like those of the leguminous tribe, the plants of this order are generally mucilaginous. From the inner bark of the greater number exudes, either naturally or by incision, a mucilaginous liquor, which sometimes dries upon the plant, and becomes a gummy substance.

34. *Cucurbitaceæ*, (from *cucurbita* a gourd); consisting of plants which resemble the gourd in external figure, habit, virtues, and sensible qualities.—The plants of this order, which generally climb, and have long diffused branches, are mostly herbaceous and perennial. The roots in the perennial plants of this order are shaped like those of the turnip; in the annuals they are branching and fibrous. The stems are cylindrical and succulent. The young branches have generally five corners. In some species of passion-flower they are square. The leaves are alternate, angular, and sometimes hand-shaped. They are attached to the branches by a foot-stalk, which is pretty long and cylindrical, without any furrow. From the wing or angle of each of the upper leaves proceeds a tendril, which is either simple or branching, and twists itself spirally round the different bodies in its neighbourhood, for the purpose of supporting and training of the branches. The lower leaves have no tendril. The flowers are either hermaphrodite or male and female. In this last, the male flowers are generally separated from the female upon the same root; and that either in the same wing or angle of the leaves, or in different angles. The flower-cup, in the female flowers, is placed upon the seed-bud; and generally consist of one bell-shaped leaf, that is deeply divided into five unequal segments, and, unlike the other plants which have the calyx seated upon the fruit, falls off with the petals and the other parts of the flower. The corolla consists of one petal, with

with five equal divisions, which adhere to the tube of the calyx, as if glued to it. A species of passion-flower, termed by Linnæus *Passiflora suberosa*, wants the petals. The lamina are in number from one to five, short, and generally inserted into the calyx. The filaments are distinct; the antheræ of many genera are united in a cylinder. In the passion-flower they are slightly attached to the filaments, on which they turn like a vane or the needle of a compass. The seed-bud is single, and placed below the receptacle of the flower. The style is generally single, cylindrical, of the length of the calyx, and crowned with a triple stigma. The seed-vessel is generally pulpy, of the apple or berry kind, and consists of one, two, or three cells. The seeds are numerous, generally flat or compressed, and sometimes covered with that kind of proper coat called by Linnæus *arillus*.—The fruit of these plants is generally purgative and refreshing; that of some of them prove a very violent emetic when used too freely.

35. *Serticole*, (from *serpens* a briar or bramble); consisting of the rose, bramble, and other plants which resemble them in port and external structure. These plants are so nearly allied in form, habit, and structure, to those of the natural order *Pomaceæ*, that they ought never to have been separated from it. The leaves have a styptic taste; the fruits are acid and cooling. With respect to their virtues, the leaves are vulnerary and astringent, the roots are diuretic. The acid fruits, as strawberry and raspberry, are used with success in putrid and bilious fevers, as likewise in contagious and epidemic dysenteries, which prevail in summer and autumn, and are occasioned by a sudden transition from a hot to a cold air, or by the acrid humour which flows into the intestines.

36. *Pomaceæ*, (from *pyrum* an apple); consisting of those which have a pulpy esculent fruit, of the apple, berry, or cherry kind. The plants of this order, which furnish many of our most esteemed fruits, are mostly of the shrub and tree kind. The roots are branched, fibrous, and in the greater part very long. The stems and branches are cylindric. These last are placed alternate; and, when young, are, in some genera, angular. The bark is thick and wrinkled. The buds are of a conic form, placed in the angles of the leaves, and covered with scales which lie over each other like tiles. The leaves, which differ in form, being in some genera simple, in others winged, are, in the greater number, placed alternate. The footstalk of the leaves is furrowed above, and frequently accompanied by a number of knobs like glands. Most of these plants are furnished with two stipule at the origin of the young footstalks of the leaves. These, in some genera, are pretty large; in others, they are so small as scarce to be perceived; and in cocoa-plumb, in particular, they by their minuteness resemble hairs. The flowers are universally hermaphrodite, except in *Spiræa aruncus*, in which male and female flowers are produced on distinct plants. In the greater number of genera they are produced in clusters or heads at the end of the branches. The calyx is of one piece, with five segments or divisions, which are permanent, and placed above the seed-bud in some; in the rest, they either fall off with the flower, or wither upon the stalk. The petals are five in number, and are inserted into the tube of the calyx. The stamina are generally 20 and upwards, and attached like the petals

to the margin of the tube of the calyx. The antheræ are short, and slightly attached to the filaments. The seed bud is single; and in those genera which have the calyx permanent, it is placed below the receptacle of the flower. The seed-vessel is a pulpy fruit of the apple, berry, or cherry kind. Those of the apple kind are divided internally into a number of cavities or cells. The seeds are numerous.—The pulpy fruits of this order are acid, esculent, and of great efficacy in putrid and bilious fevers.

37. *Columniferae*, (from *columna* a pillar, and *fero* to bear); consisting of plants whose lamina and pistil have the appearance of a column or pillar in the centre of the flower. This order furnishes a choice collection of herbs both annual and perennial, shrubs, and trees. These are very different in size and height, from the creeping mallows, and low shrubby tea-tree, to the fleshy limes, and the more lofty silk cotton trees, which by some modern writers are affirmed to be so large as not to be fathomed by 16 men, and so tall that an arrow cannot reach their top. The shrubs and trees of this order are deciduous, pretty thick, of a beautiful appearance, with an erect stem, which is formed by its branches and foliage into a round head. The roots are extremely long, branch but little, and either run perpendicularly downwards, or extend themselves horizontally below the surface. The stems are cylindric. The young branches, though commonly of the same figure, are sometimes angular. The bark is thick and pliant. The wood, in general, very soft and light. The buds are of a conic form, naked, or without scales; and situated either at the extremity of the branches, or in the angle formed by the branch and leaf. The leaves are alternate, simple, divided into several lobes, and frequently hand or finger shaped. The ribs or nerves on the back of the leaf, in some genera of this order, are provided near their origin with a number of hollow furrows or glands, which, being filled with a clammy honey-like liquor, have been considered as so many vessels of secretion. The footstalk of the leaves is cylindric, swelled at its origin, and appears jointed at its junction with the branch. The flowers are universally hermaphrodite, except in *hizgeleria*, and a species of Virginian marshmallow, called by Linnæus *napea densa*: the former of which bears male and female, the latter male and hermaphrodite, flowers on different roots. In many plants of this order, the flowers generally open about nine in the morning, and remain expanded till one in the afternoon. The flowers either terminate the branches, proceed from the angles of the leaves, or are disposed either singly or in a corymbus along the branches or stem. In most of these genera the calyx is single, but in others frequently double. In these last the inner calyx is always of one piece, generally divided into five segments; the outer consists either of one leaf, of three distinct leaves, or of many. The calyx, when single, is sometimes composed of one leaf which is permanent, or of several distinct leaves which are generally coloured, and fall off with the petals. In plants that have a double calyx, both flower-cups are generally permanent. The petals in this order are from four to nine; five is the prevailing number. The lamina, which are in number from 5 to 20 and upwards, are generally inserted into the common receptacle of the calyx, or into the pistilum or seed-bud. The filaments are either distinct.

finē, or united in a cylinder, which, proceeding from the receptacle of the calyx, surrounds the feed-bud, and attaches itself to the base of the petals, with which it slightly unites. The antheræ are frequently roundish, and placed erect on the filament; most commonly, however, they are oblong or kidney-shaped, and slightly attached by the middle, or sides, to the filaments, on which they turn like a vane or needle. This last is particularly the characteristic of all the mallow tribe. The feed-bud is generally roundish or conic; and sometimes, as in the tea-tree, angular. The feed-vessel is generally a capsule; sometimes a pulpy fruit of theERRY or cherry kind. In some, it is a woody or membranous capsule, divided into as many cells internally as there were partitions in the feed-bud. The feeds are generally solitary, sometimes angular, and sometimes kidney-shaped.—These plants are mucilaginous and lubricating.

38. *Triaceæ* (from *equi-trois*, and *μακρ., a grain*): consisting of plants with a single three cornered capsule, having three cells or internal divisions, each containing a single seed. The single feed-vessel of these plants is of a singular form, and resembles three capsules, which adhere to one common footstalk as a centre, but are divided externally into three pretty deep partitions. This family is not completely natural. It must be observed, however, that the character expressed in the title is a striking one; and that though the plants which possess it are not connected by such numerous relations as to form a true natural assemblage, yet they are by that circumstance distinguished from all other plants with as great, nay greater facility, than by any artificial character yet known. But all the genera of this order have not the striking character just mentioned.

39. *Siliquosæ*, (from *siliqua* a pod): consisting of plants which have a pod for their feed-vessel. This order chiefly furnishes biennial and perennial herbs of an irregular figure. The roots are long, branched, crooked, and fibrous. In some they are succulent and fleshy, in others jointed. The stems and young branches are cylindrical. The leaves, which differ in point of form, being sometimes simple, sometimes winged, are generally placed alternate. The flowers are hermaphrodite, and in the greater number disposed in a spike at the extremity of the branches. The flower-cup is composed of four leaves, which are oblong, hollow, blunt, bunched at the base, and fall with the flower. These leaves are sometimes erect, and sometimes spread horizontally. The petals, which are four in number, spread at top, and are disposed like a cross: the claws or lower part of the petals are erect, flat, awl-shaped, and somewhat longer than the calyx. The upper part widens outwards. The stamina are six in number; two of which are of the length of the calyx, and the remaining four somewhat longer, but shorter than the petals. The antheræ are of an oblong figure, pointed, thicker at the base, and erect. Betwixt the stamina, in plants of this order, are generally lodged one, two, or four, round greenish knots, which in some genera are so small as to elude the sight. These glands, called by Linnæus *glandule nectariferæ*, and used very improperly by that author as an essential character in discriminating the genera, seem to be prominences of the receptacle of the flower, occasioned

by the stamina being deeply lodged in its substance. The feed-bud is single, and stands upon the receptacle of the flower. The style, which is either cylindrical or flat like a scale, is of the length of the four longer stamina in some genera; in others it is very short, or even wanting. It accompanies the feed-bud to its maturity. The stigma is blunt, and sometimes deeply divided into two parts. The feed-vessel is either a lung pod, or a short and round one. Either sort has two valves or external openings, and in a great many genera the same number of internal cavities or cells, the partition of which projects at the top beyond the valves. The feeds are roundish, small, and attached alternately by a slender thread to both futures or joinings of the valves. These plants have a watery, sharp, fixivial taste; and are charged with a fixed alkaline salt, which is drawn from them by burning, and being distilled without any addition produces a volatile alkali. Most of them have a sinking smell. With respect to their virtues, they are diuretic, attenuating, detergent, and antiscorbutic. These qualities, however, are most eminently possessed by the live plants; when dried, they either entirely disappear, or are greatly diminished. Applied externally, these plants are useful in diseases of the skin, as the itch, leprosy, &c.

40. *Personatæ*, (from *persona*, a masque): consisting of a number of plants whose flowers are furnished with an irregular, gaping, or grinning petal, in figure somewhat resembling the snout of an animal. This order furnishes both herbaceous and woody vegetables of the shrub and tree kind. The roots are generally fibrous and branched. The stems and branches are cylindrical when young, except in some species of figwort, in which they are square. The leaves are simple, generally placed opposite in pairs at the bottom of the branches, but in many genera stand alternate towards the top. The flowers are universally hermaphrodite; they proceed either singly or in clusters from the wings of the leaves, or terminate the branches in a spike, panicle, or head. The calyx is of one leaf, which is cut into two, three, four, or five segments, or divisions, that are permanent. The corolla is composed of one irregular petal, with two lips, resembling, as was already observed, the head or snout of an animal. In some plants the stamina are two or four in number, and of an equal length; in others they are universally four in number, two of which are long and two short. The feed-bud is single, and placed above the receptacle of the flower. The style is single; thread-shaped; bent in the direction of the stamina; and crowned with a stigma, which is generally blunt, and sometimes divided into two. The feed-vessel is a capsule, generally divided internally into two cavities or cells, and externally into the same number of valves or inclosures. The feeds are numerous, and affixed to a receptacle in the middle of the capsule.—These plants possess nearly the same qualities with the lip-flowers, though in a less degree. With respect to their virtues, many of them are aperient, anodyne, purgative, and even emetic. The internal use of many of them is extremely pernicious; applied externally, they are anodyne, and powerful resolvents.

41. *Asperifoliæ*, rough-leaved plants. The greatest part of these are herbaceous and perennial. The roots are branching and fibrous; the stems and branches rounded;

rounded; the buds of a conic form, naked or without scales. The leaves are simple, alternate, commonly very rough to the touch, and in most of the herbaceous plants sessile or attached to the stem and branches without any foot-stalk. In the few trees, however, of this order, the leaves have a foot-stalk, the lower part of which, after the fall of the leaves, remains like a spine or thorn. The hairs are simple, and generally very rough to the touch. The flowers are in some genera solitary; but commonly collected into a spike or corymbus. They do not proceed from the angle formed by the stem or branch with the leaf, as in many plants; but from the side of the leaf, or from that part of the stem which is opposite to the leaf. They are almost universally hermaphrodite: in a few species of *coriaria*, male and female flowers are produced upon different roots. The calyx is composed of one leaf, which is divided from three to ten equal or unequal parts. Those with four naked seeds have the calyx deeply divided into five parts which are permanent. The corolla is monopetalous, or composed of one petal, which in different plants is bell, funnel, salver, and wheel shaped. The divisions of the limb or upper part of the petal are generally five, alternate with those of the calyx; equal and regular, except in *echinum*. The stamina are five in number, alternate with the divisions of the corolla. They are equal, attached to the tube of the corolla a little above its origin, and of the same height. The antheræ are in some genera *connivent*; that is, approach and form a compact body above the filaments. The pistillum is generally composed of a slender style of the same length with the stamina, and crowned with a simple stigma. It proceeds from a germen or seed-bud, which in some plants is undivided, but generally split into four. The seeds are generally four in number, and lodged in the bottom of the calyx.—Most of the rough-leaved plants are used in medicine: the flowers are esteemed cordial, the leaves and roots vulnerary and astringent; and the hard bony seeds are reckoned powerful promoters of mine. Externally, these plants are used for burnings and poisonous bites; they extirpate warts, and relieve disorders of the loins.

42. *Verticillate*, consisting of herbaceous vegetables, having four naked seeds, and the flowers placed in whorls round the stalk. The roots are branched and fibrous. The stems are round when old, but square when young; as are likewise the young branches, which stand opposite. The leaves are opposite, and in the greater number covered with transparent points. Those which are placed next the flower generally differ from the stem-leaves. In the greater number of plants of this kind, the leaves are supported upon a long cylindrical foot-stalk that is furrowed above. The flowers are universally hermaphrodite, except in a species of thyme mentioned by Mr Adanson, which appears to have male or barren flowers on one root, and female or fertile flowers on the other. They are disposed round the stem in whorls or small heads with short foot-stalks. The calyx is of one piece, that is generally cut into five unequal divisions, whose disposition sometimes represents two lips; the uppermost of which has commonly a less number of divisions: it accompanies the seeds, which it nourishes in its bosom, to their maturity. The petal is of the gaping or lip kind, and in the different ge-

nera is more or less irregular or unequal: either in its tube, or in the divisions of the lips; the number of which varies from two to five. These divisions frequently form two lips; of which the uppermost, termed the *crest* and the *helmet*, is sometimes entire, sometimes more or less deeply cut into two; the lowermost, termed the *leaf*, generally into three. The stamina are two or four in number. In the greater part there are four stamina of unequal length, two of them being long and two short. These four unequal stamina are frequently dissimilar, and approach by pairs: they are inclined towards the back of the petal, and parallel; the two innermost being shorter, and attached somewhat lower than the two others to the tube of the flower. The seed-bud, which consists of four distinct ovaries, is placed upon the seat of the flower, and elevates from their centre a common style, which is slender, bent in the same manner as the filaments, which is somewhat exceeds in length, and terminated by a double stigma or summit, the divisions of which are unequal, and turned backwards. The seed-vessel in this order is wanting. The seeds are four in number, and lodged in the bottom of the calyx as in a matrix or seed-vessel. Each seed has two covers; the one external, of a cartilaginous or leathery substance; the other internal, membranaceous, of a very fine texture, and placed immediately above the radicle or embryo plant.—The plants of this order are fragrant, warm, penetrating, and accounted cordial and cephalic. Their chief virtue resides in the leaves.

43. *Dunscæ*, (from *dunus* a bush); consisting of a number of shrubby plants, which are thick set with irregular branches, and bushy. The plants of this order are all of the shrub and tree kind, thick and bushy, rising from 6 to 25, 30, and even 40 feet high. Many of them too, as ballard alaternus, holly, iron-wood, New-Jersey-tea, star-apple, viburnum, winter-berry, and some others, retain their beautiful leaves during the whole year. The roots are branched and fibrous. The stems are cylindric; the young branches sometimes angular. The buds are naked, that is, without scales, in the evergreen shrubs of this order; covered with scales in most of the others. The leaves, which in some genera are simple, in others compound, are placed alternate in some, and opposite in others. The flowers are mostly hermaphrodite. They proceed from the wings of the leaves either singly or in clusters; or they terminate the stem in that sort of flowering head called a *corymbus*. The calyx is generally very small, placed below or around the seed-bud; and consists of one leaf, with four, five, or six divisions, which are permanent. The stamens has no calyx. The petals are in number from one to five. The stamina are either four, five, six, or ten. The seed-bud is generally roundish, and placed within the flower. The style is commonly single, and sometimes wanting. The stigma is either single or triple. The seed-vessel is generally a berry, sometimes a dry capsule; the seeds are generally single and egg-shaped. The berries, bark, and flowers of many of these plants are purgative, and act particularly on the lymph and bile.

44. *Sepiaria*, (from *sepis* a hedge); consisting of a beautiful collection of woody plants, some of which, from their size, elegance, and other circumstances, are very proper furniture for hedges. This order furnishes

woody plants both of the shrub and tree kind, most of which do not drop their leaves till nearly the time when the new leaves begin to appear.

45. *Umbellatæ*, (from *umbella* an umbel); consisting of plants whose flowers grow in umbels, with five petals that are often unequal, and two naked seeds that are joined at top and separated below. These plants are herbaceous, and chiefly perennial. The roots are either tuberous or spindle-shaped, and sometimes forked. The stems are cylindrical, full of pitch, and frequently hollow. The branches are alternate. The leaves, which like the branches are put on alternately, are very different in point of form; being simple and entire in some; target-shaped, in a species of navel-wort; finger or hand shaped, in some others; and winged or pinnated with numerous minute divisions, as in the greater number. They are supported by a foot-stalk, which is very broad and membranous at its origin, and commonly embraces the whole contour of the stem and branches. The flowers are in general hermaphrodite. There are, however, some that have male or barren flowers in the same umbel. This is particularly the case with those umbelliferous plants which have the petals in the flowers of the circumference large and unequal. In these plants the flowers in the circumference only prove fertile; those in the centre, or disk, proving abortive. *Oenanthe* and *imperatoria*, on the contrary, have the flowers in the circumference abortive. In ginseng, hermaphrodite and male flowers are produced upon distinct plants. The flowers are disposed in an umbel, which is either simple or compound. The common calyx in this order is that sort termed very improperly by Linnæus *involucrum*, or the flower-cover; which in the greater number consists of one or more leaves placed under the partial or universal umbel, or both, for the purpose of support. The presence or absence of one or both of these covers affords excellent marks in discriminating the genera of this very similar order of plants. The proper calyx of each flower, in the aggregate, consists of five minute indentments placed upon the seed-bud, which it envelops, and accompanies to its maturity. The petals are five in number, and disposed upon the sides of the flower-cup in form of a rose. In the florets of the centre, the petals are generally pretty equal and small; in those of the circumference, they are frequently unequal and larger; in the greater number, they are heart-shaped, and cut almost to the middle in two. The stamina are five in number, placed opposite to the divisions of the flower-cup, and alternate with the petals. The seed-bud is universally placed under the seat of the flower, and supports two styles which are turned backwards, and crowned with simple summits which do not differ in appearance from the styles. The seed-vessel in this order is wanting. The seeds are two in number, which, when ripe, separate below, but remain closely attached at top. The plants of this order, which grow in dry places, are sudorific, stomachic, and warming. Their virtue resides chiefly in the seeds and leaves. Those which grow in marshy places are generally poisonous; but, notwithstanding the extremely warm and even caustic quality of most of these plants, many of them are employed in the kitchen, and in the œconomy of domestic affairs.

46. *Hederacæ*, (from *hedera* ivy); consisting of ivy

and a few other genera that seem nearly allied to it. This order furnishes both herbaceous and shrubby plants; most of which, particularly ivy and vine, have creeping branches, which attach themselves by roots or tendrils to the bodies in their neighbourhood. The roots are long, with few branches. The stems and young branches are cylindrical. In some species of vine they are square. The leaves are alternate; sometimes simple, sometimes winged, in which the surface of the leaves is covered with points. The foot-stalk of the leaves is cylindrical, and without any furrow. The buds are of a conic form, and without any scales. The flowers are either hermaphrodite, male and female upon different roots, or hermaphrodite and male upon different roots. In some, they terminate the branches in an umbel; in others, they proceed in clusters from the side opposite to the leaves; and in some, they are produced along the branches. The calyx consists of one leaf divided into five parts, which are small and generally permanent. The petals in this order are generally five. The stamina are in number five; awl-shaped, erect, and generally of the length of the petals. *Cissus* has only four stamina, which are inserted into the nectarium, a sort of border surrounding the seed-bud. The anthers are roundish, and sometimes, as in ivy, attached to the filaments by the sides. The seed-bud is sometimes round, sometimes shaped like a top or pear, and ends in one, two, or five awl-shaped styles, which are crowned with a simple stigma. The flowers of the vine have no style. The seed-vessel is of the berry kind, with one, two, or five styles. The seeds are from one to five in number; placed either in distinct cells, or dispersed through the pulp without any partition.

47. *Stellatæ*, (from *stella* a star); consisting of plants with two naked seeds, and leaves disposed round the stem in form of a radiant star. This order contains herbs, shrubs, and trees. The herbs, which are most numerous, are chiefly annual, and creep along the surface of the ground. The shrubs and trees are mostly evergreens, which rise erect, and are of an agreeable conic form.—These plants are opening; some of their seeds, particularly those of coffee, are bitter and cordial; some of them are used in dyeing, and others in medicine.

48. *Aggregate*, (from *aggregare*, to assemble or collect); comprehending those plants which have aggregate flowers, consisting of a number of florets or small flowers, each of which have a proper and common calyx.

49. *Compositæ*, consisting of plants with compound flowers. In this order Linnæus has constructed his first or primary divisions from the different sexes of the florets, which he terms *polygamy*; the subaltern divisions are constructed from the figure of the petals, the disposition of the flowers, the pappus or crown of the seed, the common receptacle, and other circumstances which characterize the subaltern divisions in other authors.

50. *Amentacæ*, (from *amentum* a catkin), plants bearing catkins; as *salix*, *populus*, *platanus*, &c.

51. *Coniferæ*, (from *conus* a cone, and *fero* to bear); consisting of plants, whose female flowers, placed at a distance from the male, either on the same or distinct roots, are formed into a cone. In this character, the only

only one expressed in the title, the plants in question seem to be nearly allied to the family of mosses: from which, however, they are easily distinguished by their habit, as well as by the structure of the small flowers, in which the stamina are united below into a cylinder, and distinct at top. The plants of this order are mostly of the shrub and tree kind, and retain their leaves all the year. The form of these plants is generally conic, and extremely beautiful, from the disposition of the branches, which cover the stems even to the roots, extending themselves horizontally and circularly like so many rays. The height of some genera of this order does not exceed half a foot, that of others approaches to a hundred. The roots are short, branching, not very fibrous, and extend horizontally. The stems and branches are cylindrical. The bark is thin, and split into slender scales. The wood, except that of the yew-tree, possesses little hardness. The buds are of a conic form, and naked, or without scales. The leaves are entire, small, and thick, frequently triangular, and generally pointed. Juniper has a prickly and thorny leaf. With respect to situation, they admit of great variety, being either alternate, opposite, placed in whorls round the stem, or collected into small bundles which proceed from a single point. They are placed on the branches without any sensible footstalk. The flowers in this order are universally male and female. In some genera, the male flowers are collected into a spike or cone at the end of the branches; in others, they proceed singly from the wings of the leaves, or termination of the branches. The female flowers are generally collected into a cone; but in yew-tree and shrubby horse-tail they are single, and terminate the branches. The calyx of the male flowers is a catkin; of the female, a cone. The petals of this order are wanting; except in the female flowers of juniper, which have three sharp, rigid, and permanent petals. The stamina are in number from 3 to 20 and upwards; united by their filaments into a cylinder or pillar, which rises out of the centre of the calyx. The antheræ are erect, distinct, of a roundish form, and divided into internal partitions or cells, which, in the different genera, are in number from two to ten. The feed-buds are generally numerous, and placed betwixt the scales of the cone, which serve for a calyx. From each feed-bud arises a very short cylindrical style, crowned with a simple stigma, of a conic form. These plants have probably no feed-vessel or fruit; the seeds being naked, and involved only by the scales of the calyx. In some genera, these scales are of a bony nature, and almost united; in others, they are of a substance like leather; in juniper, they are united, and become fleshy and succulent like a berry. The seeds in this order, being nourished, as in a feed-vessel, by the scales of the cone, or common calyx, differ in nothing from the germina or feed-buds.—Most of the cone-bearing plants are resinous, or gummy; and the gums proceeding from them have a bitter taste, but generally a very agreeable smell.

52. *Coarctatæ*, (from *coarctare*, to join or gather together); so termed from the general appearance of the feed-vessels, which are numerous, and being slightly attached below, form all together a single fruit in the shape of a sphere or cone; the parts of which, however, are easily separated from one another. This order, which consists of exotic plants, furnishes a beautiful and choice

collection of shrubs and trees, both evergreen and deciduous. The trees are often 60 feet high, and garnished from the bottom to the top with spreading branches and leaves of a bright green colour, which assume a very agreeable conic form. The roots are branching and fibrous. The stems are cylindrical, and the wood very hard. The buds are conic, flat, and generally without scales. The leaves are universally simple and alternate. The footstalk is cylindrical, without furrows, frequently swelled at its origin, and appears jointed at its insertion into the branch. The flowers are hemispherical, and are generally produced either along or at the end of the branches. The calyx generally consists of three oblong plain leaves, like petals, which fall off with the flower. The petals are in number from 6 to 18, oblong, concave, and frequently disposed in two or three series or rows, the outermost of which are largest. The stamina are numerous, short, and inserted into the common receptacle in some, and into the feed-bud in others. The filaments are very short and slender, some genera having scarce any at all. The antheræ are numerous, slender, and placed round the feed-bud. The pistillum generally consists of a number of feed-buds disposed in the form of a cone, and seated upon a receptacle which rises like a small pillar above the receptacle of the calyx. From each feed-bud generally arises a cylindrical style, which is very short. The stigma is commonly blunt. The feed-vessel is commonly a berry; but in magnolia it is an oval cone, consisting of a number of roundish capsules laid over each other like tiles. The fruits or feed-vessels, whether of the berry, capsule, or cherry kind, are equal in number to the feed-buds, and generally slightly attached below. The seeds are numerous, hard, roundish, and sometimes combed. The plants of this order have a strong, agreeable, and aromatic smell; the fruits and seeds have a pungent taste like pepper; the bark and wood are bitter.

53. *Scabrite*, (from *scaber* rough, rugged, or brittle); consisting of plants with rough leaves. There seems to be some impropriety in characterizing these plants by a name expressive of the roughness of their leaves, as that circumstance had previously furnished the classic character of the *Asperifoliae*. The degree of roughness, however, is much greater in the plants which make the subject of the present article.—The plants of this order are in general of an astringent nature; their taste is bitter and styptic.

54. *Miscellanæ*, miscellaneous plants. This order consists of such genera as are not connected together by very numerous relations. They are, datiscæ, poterrum, reseda, sanguisoba, lemmæ, pillia, coitana, ceapetrum, achyranthes, amaranthus, celosia, gomphrena, ireline, phytolacca, nymphosa, buracenia, cedrela, swietenia, corrigiola, lincum, telephium.

55. *Fices*, ferns; consisting of plants which bear their flower and fruit on the back of the leaf or stalk. These plants, in figure, approach the more perfect vegetables; being furnished, like them, with roots and leaves. The roots creep, and extend themselves horizontally under the earth, throwing out a number of very slender fibres on all sides. The stem is not to be distinguished from the common footstalk, or rather middle rib of the leaves: so that in strict propriety the greater number of ferns may be said to be *acaules*; that

is, to want the stem altogether. In some of them, however, the middle rib, or a stalk proceeding from the root, overtops the leaves, and forms a stem upon which the flowers are supported. The leaves proceed either singly, or in greater numbers from the extremities of the branches of the main root. They are winged or hand-shaped in all the genera except in adders-tongue, pepper-grass, and some species of spleen-wort. The flowers, whatever be their nature, are, in the greater number of genera, fastened, and as it were glued, to the back of the leaves; in others, they are supported upon a stem which rises above the leaves; but in some, are supported on a flower-stalk, as already mentioned. The stamina are placed apart from the seed-bud in a genus termed by Mr Adanson *palmi filix*; in the other ferns, where we have been able to discover the stamina, they are found within the same covers with the seed-bud. Most of the ferns have a heavy disagreeable smell: as to their virtues, they are opening and attenuating.

56. *Musci*, mosses. These plants resemble the pines, firs, and other evergreens of that class, in the form and disposition of their leaves, and manner of growth of the female flowers, which are generally formed into a cone. They frequently creep, and extend themselves like a carpet upon the ground, trees, and stones, being generally collected into bunches and tufts: the smallest are only one third of an inch in height, and the largest do not exceed five or six. Few of the mosses are annual; small as they are, the greater number are perennial and evergreens. Their growth is remarkably slow, as may be judged by the time that the antheræ take to ripen. This, reckoning from the first appearance of the antheræ to the dispersion of its powder or male dust, is generally four or six months. Although preserved dry for several years, these plants have the singular property of resuming their original verdure, upon being moistened. It would be worth while to determine whether they do not also resume their vegetative quality. The roots of plants of this order are fibrous, slender, branched, and short. The stems are cylindric and weak, as are also the branches; they creep upon the ground, and strike root on every side. The leaves are very small and undivided. They differ with respect to situation; being either alternate, opposite, or placed by fours round the stalk. They have no perceptible footstalk nor middle rib, and are seated immediately upon the stem. The flowers are universally male and female: in some, the male flowers are produced upon the same plants with the female, and stand before them; in others, they are produced sometimes on the same, and sometimes on distinct plants. The male flowers consist entirely of antheræ, and their covering; proceed either singly, or in clusters, from the extremity of the branches, or angles of the leaves; and are either seated immediately upon the branches, or supported by a long footstalk. The female flowers, which generally resemble capsules or cones, are all placed immediately upon the stem or branches, without any footstalk; and proceed singly either from the wings of the leaves, or summit of the

branches; when produced upon the same plant with the male, they are always placed under them. The female cones of the mosses greatly resemble those of the pines, and evergreen trees of that class; the scales which form them are true leaves, each containing in its wing or angle a single seed. When the seeds are ripe, the cones probably open for their dispersion. When shut, they resemble buds, and have sometimes been ignorantly mistaken for such. The calyx, in this order, if it can be called such, is that appearance resembling a veil or monk's cawl, which in the male flowers covers or is suspended over the tops of the stamina like an extinguisher, and is termed by Linnæus *calyptra*. The petals are universally wanting. The mosses in general are almost tasteless, have few juices, and being once dried do not readily imbibe moisture from the air. Those which grow in water, being thrown into the fire, grow red, and are reduced to ashes without receiving or communicating any flame; on which account some superstitious people, the Siberians in particular, place water moss in their chimnies as a preservative against fire. Most of the mosses are purgative; some violently so, and even emetic. They are all of wonderful efficacy in preserving dry such bodies as are susceptible of moisture; and in retaining, for a long time, the humidity of young plants without exposing them to putrefaction. For this reason, such plants as are to be sent to any considerable distance, are generally wrapped up in them.

57. *Algæ*, flags; consisting of plants whose root, leaf, and stem, are all one. Under this description are comprehended all the sea-weeds, and some other aquatic plants.

58. *Fungi*, mushrooms. These plants are rarely branched, sometimes creeping, but most commonly erect. Such as are furnished with branches have them of a light spongy substance like cork. Mushrooms differ from the fuci, in that those which, like the fuci, have their seeds contained in capsules, are not branched, as that numerous class of sea-weeds are. The greatest part of mushrooms have no root; some, instead of roots, have a number of fibres, which, by their inflexions, frequently form a net with unequal meshes, some of which produce plants similar to their parent vegetable. The stamina in these plants are still undetermined. The seeds are spread over the surface of the plant, or placed in open holes or cavities, resembling the open capsules of some of the fuci. In mushrooms which are branched, the seeds are frequently visible by the naked eye, and always to be distinctly observed by the assistance of a good microscope. These plants are very astringent, and some of them are used for stopping violent hæmorrhages. As a vegetable food, they are at best suspicious: some of them are rank poison.

Dubii orlinis. Under this name Linnæus classes all the other genera which cannot be reduced to any of the abovementioned orders, and which are near 120 in number.

Botany
 ||
 Botargo.

BOTANY-BAY. See NEW HOLLAND.
 BOTANOMANCY, (from *botan.*, *herb*, and *μαντις*, *divination*), an ancient species of divination, by means of plants; especially sage and fig-leaves. The manner of performing it was thus: the persons who consulted wrote their own names and their questions on leaves, which they exposed to the wind; and as many of the letters as remained in their own places were taken up, and being joined together, contained an answer to the question.
 BOTARGO, a kind of sausage, made with the eggs and blood of the mullet, a large fish common in the Mediterranean. The best kind comes from Tunis in Barbary: It must be chosen dry and reddish. The people of Provence use a great deal of it, the common way of eating it being with olive oil and lemon juice.
 Vol. III. Part II.

There is also a great consumption of it throughout the Levant.

BOTE, (Sax.), signifies a recompence, satisfaction, or amends: hence comes *manbote*, compensation or amends for a man slain, &c. In king Ina's laws is declared what rate was ordained for expiation of this offence, according to the quality of the person slain. From hence likewise we have our common phrase, *to-bote*, i. e. *compensationis gratia*. There are *house-bote*, *plough-bote*, &c. privileges to tenants in cutting of wood, &c.

BOTELESS, (*sine remedio*). In the charter of Hen. I. to Tho. archbishop of York, it is said, "that no judgment, or sum of money, shall acquit him that commits sacrilege; but he is in English called *boteless*, viz. without emendation." We retain the word still in common

Bot e,
 B. telefs.

Both
||
Botticelli.

common speech: as, It is *bottleless* to attempt such a thing; that is, It is in vain to attempt it.

BOTH (John and Andrew), Flemish painters, and pupils of Bloemart. The union of these brothers was very singular; they were inseparable in their studies, travels, and paintings. John painted the landscape part of their pictures in the manner of Lorrain, and Andrew the figures and animals in the style of Bamboche. They both died in 1650. John's taste in landscape is elegant; his ideas are grand; his composition beautiful; and his execution rich and masterly in the highest degree. His light is not always well distributed; but his figures are excellent. It is to be regretted that we have not more of his works; for they are certainly, upon the whole, among the best landscapes we have.

BOTHNIA, a province of Sweden, at the end of the gulph of the same name. It is divided into two parts called *east* and *west Bothnia*, the former of which belongs to Finland. West Bothnia is full of mountains; the earth is sandy, and yet a scarcity of provisions is seldom known. Cattle and game are so common, salmon and a sort of herrings so plenty, and the trade of skins is so gainful, that the inhabitants can command what they want from their neighbours. There are only two towns worth mentioning, *viz.* Tornea and Uma. The inhabitants of this province are Protestants; and are a civil well-behaved people.

BOTRYS, **BOTRUS**, or *Bysira*, (anc. geog.) a town of Phoenicia, on the Mediterranean, built by Saturn, (a proof at least of antiquity); twelve miles to the north of Byblus, and twenty to the south of Tripolis. Now almost in ruins, and called *Bateron*, or *Boturn*, (Postellus). E. Long. 37. 30. Lat. 34. 6.

BOTT, among bone-lace weavers, a kind of round cushion of light matter placed on the knee, whereon they work or weave their lace with bobbins, &c.

BOTT, in zoology. See **BOTRS**.

BOTTICELLI, (Sandro, or Alessandro), born at Florence in 1437, learned the rudiments of painting under Filippo Lippi. He executed several pictures for pope Sixtus IV. and others for the city of Florence: for these he received large sums of money, all of which he expended, and died at last in great distress, aged 78. He was not only a painter, but a man of letters. Baldini, according to the general report, communicated to him the secret of engraving, then newly discovered by Finiguerra their townsmen. The famous edition of Dante's Poem of Hell, printed at Florence by Nicholo Lorenzo della Magna, A. D. 1481, and to which, according to some authors, Botticelli

Strutt's Dict.

undertook to write notes, was evidently intended to have been ornamented with prints, one for each canto; and these prints (as many of them as were finished) were designed, if not engraved, by Botticelli. It is remarkable, that the two first plates only were printed upon the leaves of the book, and for want of a blank space at the head of the first canto, the plate belonging to it is placed at the bottom of the page. Blank spaces are left for all the rest; that as many of them as were finished might be pasted on. Mr Wilbraham possesses the finest copy of this book extant, in any private library; and the number of prints in it amounts to nineteen. The two first, as usual, are printed on the leaves; and the other seventeen, which follow regularly, are pasted on the blank spaces. And these ap-

parently were all that Botticelli ever executed. About the year 1460, it is said, that he engraved a set of plates, representing the *Prophets and Sibyls*. Bafan tells us that he marked these plates with a *monogram* composed of an A and a B joined together.

BOTTLE, a small vessel proper to contain liquors, made of leather, glass, or stone. The word is formed from *butellus*, or *botellus*, used in barbarous Latin writers, for a lesser vessel of wine; being a diminutive of *bota*, which denoted a butt or cask of that liquor.

The ancient Jewish bottles were cags made of goats- or other wild beasts skins, with the hair on the inside, well sewed and pitched together; an aperture in one of the animal's paws serving for the mouth of the vessel.

Glass bottles are better for cyder than those of stone. Foul glass-bottles are cured by rolling sand or small shot in them; multy bottles, by boiling them. See **GLASS**.

Bottles are chiefly made of thick coarse glass; though there are likewise bottles of boiled leather made and sold by the case-makers. Fine glass-bottles covered with straw or wicker, are called *flasks* or *betteses*. The quality of the glass has been sometimes found to affect the liquor in the bottle.

Dr Percival cautions against the practice of cleaning of wine-bottles with leaden shot. It frequently happens (he thinks), through inattention, that some of the little pellets are left behind; and when wine or beer is again poured into the bottles, this mineral poison will slowly dissolve, and impregnate those vinous liquors with its deleterious qualities. The sweetness which is sometimes perceived in red port wine may arise from this cause, when such an adulteration is neither designed nor suspected.—Potash is recommended for cleaning bottles: a small quantity in the water will clean two gross.

BOTTLING, the operation of putting up liquors in bottles corked, to keep, ripen, and improve. The writers on good husbandry give divers rules concerning the bottling of beer, cyder, and the like. The virtues of Spaw, Pyrmont, Scarborough, and other waters, depend on their being well bottled and corked, otherwise they lose both their taste and smell. To preserve them, it is necessary the bottles be filled up to the mouth, that all the air may be excluded, which is the great enemy of bottled liquors. The cork is also further secured by a cement. Some improve their bottled beer, by putting crystals of tartar and wine, or malt spirits; and others, by putting sugar boiled up with the essence of some herb, and cloves, into each bottle.

Cyder requires special precautions in the bottling; being more apt to fly, and burst the bottle, than other liquors. The best way to secure them, is to have the liquor thoroughly fine before it be bottled. For want of this, some leave the bottles open a while, or open them after two or three days bottling, to give them vent. If one bottle break, through fermentation, it is best to give them all vent, and cork them up again. Mean cyder is apter to break the bottles than rich. Some soak the corks in scalding water, to render them more pliant and serviceable. Another particular to be observed is, to lay the bottles so as that liquor may always keep the cork wet and swelled. Something also depends on the place where the bottles are set, which ought

Bottle.
Bottling.

Bottom ought to be such as exposes them as little as possible to the alterations and impressions of the air: the ground is better for this purpose than a frame; sand better than the bare ground, and a running water, or a spring often changed, best of all.

To hasten the ripening of bottled liquors, they are sometimes set in a warm place, or even exposed to the sun, when a few days will bring them to maturity.

BOTTOM, in a general sense, denotes the lowest part of a thing, in contradistinction to the top or uppermost part.

BOTTOM, in navigation, is used to denote as well the channel of rivers and harbours, as the body or hull of a ship. Thus, in the former sense, we say, a *gravelly bottom*, *clayey bottom*, *sandy bottom*, &c. and in the latter sense, a *British bottom*, a *Dutch bottom*, &c.—By statute, certain commodities imported in foreign bottoms pay a duty called *petty customs*, over and above what they are liable to if imported in British bottoms.

BOTTOMRY, in commerce, (a practice which originally arose from permitting the master of a ship in a foreign country to hypothecate the ship in order to raise money to refit), is in the nature of a mortgage of a ship; when the owner takes up money to enable him to carry on his voyage, and pledges the keel or bottom of the ship (*pars pro toto*) as a security for the repayment. In which case it is understood, that if the ship be lost, the lender loses also his whole money; but if it return in safety, then he shall receive back his principal, and also the premium or interest agreed upon, however it may exceed the legal rate of interest. And this is allowed to be a valid contract in all trading nations, for the benefit of commerce, and by reason of the extraordinary hazard run by the lender. And in this case, the ship and tackle, if brought home, are answerable (as well as the person of the borrower) for the money lent. But if the loan is not upon the vessel, but upon the goods and merchandize, which must necessarily be sold or exchanged in the course of the voyage, then only the borrower, personally, is bound to answer the contract; who therefore, in this case, is said to take up the money at *respondentia*. These terms are also applied to contracts for the repayment of money borrowed, not on the ship and goods only, but on the mere hazard of the voyage itself; when a man lends a merchant 1000*l.* to be employed in a beneficial trade, with condition to be repaid with extraordinary interest, in case such a voyage be safely performed: which kind of agreement is sometimes called *fenus nauticum*, and sometimes *usura maritima*. But as this gave an opening for usurious and gaming contracts, especially upon long voyages, it was enacted by the statute 19 Geo. II. c. 37. that all monies lent on bottomry, or at *respondentia*, on vessels bound to or from the East Indies, shall be expressly lent only upon the ship, or upon the merchandize; that the lender shall have the benefit of salvage; and that if the borrower has not on board effects to the value of the sum borrowed, he shall be responsible to the lender for so much of the principal as hath not been laid out, with legal interest and all other charges, though the ship and merchandize be totally lost.

BOTTOMY. A cross bottomy, in heraldry, terminates at each end in three buds, knots, or buttons, re-

sembling, in some measure, the three-leaved grass; on which account Segoing, in his *Treſor Heraldique*, terms it *croix treslee*. It is the badge of the order of St Maurice. See *HERALDRY Plates*.

BOTTRIGARO (Hercule), a person eminently skilled in the science of music, though not a musician by profession. He was a man of rank in Bologna; and appears, from several letters to him that have been printed, to have had the title of *Count*. He published several controversial pieces on the subject of music. It seems that he entertained strong prejudices in favour of the ancient music; and that he attempted, as Vincenzio and others had done, to introduce the chromatic genus into practice, but with no better success than had attended the endeavours of others. He corrected Gogavino's Latin version of Ptolemy in numberless instances; and that to so good a purpose, that Dr Wallis has in general conformed to it in that translation of the same author which he gave to the world many years after. He also translated into Italian *Botius de Musica*, and as much of Plutarch and Macrobius as relates to music: besides this, he made annotations upon Aristoxenus, Franchinus, Spataro, Vicentino, Zarlino, and Galilei; and, in short, on almost every musical treatise he could lay his hands on, as appears by the copies which were once his own, and are now deposited in many libraries in Italy. Of Bottrigaro's works it is said, that they contain greater proofs of his learning and skill in music, than of his abilities as a writer, his style being remarkably inelegant: nevertheless, he affected the character of a poet; and there is extant a collection of poems by him, in 8vo, printed in 1557. Walther † represents him as an able mathematician, and a collector of rarities; and says that he was possessed of a cabinet, which the emperor Ferdinand II. had a great desire to purchase. He died in 1609.

BOTTS, in zoology, a species of worms which can be produced and nourished only in the intestines of a horse. It is there alone they can enjoy the proper temperature of heat, and receive the nourishment necessary for them. See *OESTRUS*.

Besides the long worms which have been observed in the bodies of horses, there are also short ones.—By these are to be understood what we call *botts*.

All authors, both ancient and modern, who have treated of the diseases of horses, have taken notice of these worms; but M. Vallisnieri is the first who has traced them to the last stage of their transformation, and has seen them change into a hairy kind of fly like the drone.

The flies from which these botts are produced inhabit the country, and do not come near houses, at least not near those of great towns; and therefore horses are never liable to have these worms (*i. e.* botts) in their bodies, if they have been kept in the house, especially in a town, during the summer and autumn.

It is in the former of these seasons, and perhaps too in the beginning of the latter, that the females of these flies apply themselves to the anus of horses, and endeavour to gain admittance, in order there to deposit their eggs, or perhaps their worms.

The precise instant of their entrance will scarce admit of an eye-witness, but by the merit chance; yet M. Vallisnieri says, that Dr Gaspari had attained this very uncommon sight. The Doctor (he tells us) was

Bottrigaro.
Botts.

† *Magist. Lexic.*

Botts.

one day looking at his mares in the field; and from being very quiet, he observed, that on a sudden they became very restless, and ran about in great agitation, prancing, plunging, and kicking, with violent motions of their tails. He concluded, that these extraordinary effects were produced by some fly buzzing about them, and endeavouring to settle upon the anus of one of them; but the fly not being able to succeed, he observed it to go off with less noise than before, towards a mare that was feeding at a distance from the rest; and now the fly taking a more effectual method to obtain its design, passed under the tail of the mare, and so made its way to the anus. Here at first it occasioned only an itching, by which the intestine was protruded with an increasing aperture of the anus; the fly taking the advantage of this, penetrated further, and secured itself in the fold of the intestine:—this effected, it was in a situation proper for laying its eggs. Soon after this, the mare became very violent, running about, prancing, and kicking, and throwing herself on the ground; in short, was not quiet, nor returned to feeding, till after a quarter of an hour.

The fly then, we see, can find means of depositing its eggs, or perhaps its worms (*i. e.* botts), in the fundament of the horse; which once effected, it has done all that is necessary for them. If these bott worms are not hatched when first deposited in the horse, but are then only eggs, it will not be long before it happens, from the nutritive heat they there receive.

These bott-worms soon make their way into the intestines of the horse: they occupy such parts of this region as are to them most convenient; and sometimes (as we shall see presently) they penetrate even to the stomach. All the hazard they appear to be exposed to, is that of being carried away from the places they have fixed on by the excrement, which may seem likely to drive all before it. But nature has provided for all things; and when we shall have further described these bott worms, it will seem that they are able to maintain their situation, and to remain in the body of the horse, as long as they please.

There is a time when these bott-worms are of themselves desirous to leave this their habitation, it being no longer convenient for them after the purposes of their growth are answered. Their transformation to a fly must be performed out of the horse's body: and accordingly, when the time of their transformation draws near, they approach towards the anus of the horse; and then leave him of their own accord, or with the excrement, with which they then suffer themselves to be carried along.

According to Mr de Reaumur's observations, the bott worms have two unequal claws, by which they are enabled to remain in the intestines of the horse in opposition to all efforts of the excrement to force them out.—These claws are of a sort of anchor, differently disposed from those of common anchors, but contrived to produce the same effect. Besides these two claws, nature has given them a very great number of triangular spines or bristles, very sufficient to arm them against the coats of the intestines, and to resist the force employed to drive them towards the anus, provided the head be directed towards the stomach of the horse.

It will be asked, no doubt, if these bott worms are not dangerous to horses?—The mares which afforded

Mr de Reaumur, for several years, those on which he made his observations, did not appear to be less in health than those which had none; but it may sometimes happen, that they are in so great a quantity in the body of the horse as to prove fatal to him. M. Vallisnieri supposes these bott-worms to have been the cause of an epidemical disease that destroyed a great many horses about Verona and Mantua in the year 1713. —The observations communicated to him by Dr Gaspari sufficiently confirm his supposition. This gentleman, upon dissecting some horses that died of this distemper, found in their stomachs a surprising quantity of short worms; of which to give us some idea, he compares them to the kernels of a pomegranate opened: each of these, by gnawing on the coat of the stomach, had made for itself a kind of cellule therein, each of which would easily contain a grain of Indian wheat. It is easy to imagine by this means the stomach must be reduced to a wretched condition; the outer membranes were inflamed, and the inner ones ulcerated and corrupted; a very small quantity of these worms were found in the small intestines, and only a few in the larger, to which last they were found affixed, but had not corroded them. It is only perhaps when these bott-worms are in great numbers, and thereby incommode each other in the intestines of the horse, that they make their way towards the stomach; and indeed a very few flies must be enough to overstock the inside of a horse, provided they should deposit all their eggs, and such should all be animated, M. Vallisnieri having counted 700 and odd in the body of one single fly.

When one of these botts has left the anus of the horse, it falls on the ground; and immediately seeks out for some place of safety, where it may retire, to prepare for the last stage of its transformation, by which it is to become a fly. And now by degrees the skin hardens and thickens; and at length forms a solid shell or cocoon, the form of which scarce differs from that of the worm. It is first of a pale red colour, which changes into chestnut; and at length, by the addition of gradual and successive shades of brown, the shell is rendered black. The worm, or bott, before it passes into a nymph, is of the form of an oblong ball; it remains in this form much longer than worms of the flesh-fly kind. M. de Reaumur met with worms that retained this figure five or six days; as yet, one can perceive no traces of the legs, wings, and head of the nymph. Hence he first learned, that those bott worms do not become nymphs immediately upon their first change; but that, in order to become flies, they must undergo one change more than caterpillars ordinarily do to become butterflies.—For the cure of horses troubled with botts, see FARRIERY, § xv.

BOTWAR, a town of Germany, in the circle of Snabia, and subject to the duke of Wittenberg. E. Long. 9. 15. N. Lat. 49. 0.

BOTZENBURG, a town of Germany, in the duchy or Meeklenburg. It had a castle, which was destroyed by the Danes in 1202. It is seated on the Elbe, and the vessels that pass by are obliged to pay a considerable toll. E. Long. 10. 48. N. Lat. 53. 34.

BOVA, an episcopal town of Italy, in the kingdom of Naples, seated near the Apennine mountains. E. Long. 16. 15. N. Lat. 37. 15.

BOUCHAIN, a fortified town of the French Netherlands,

Botts.

Bche, therlands, in the province of Hainault. It is divided into two parts by the river Scheld. It was taken by the French in 1676; and by the allies under the duke of Marlborough in 1711, which was the last military achievement of that great general; but the following year it was retaken by the French. E. Long. 3. 15. N. Lat. 50. 17.

BOUCHE OF COURT, the privilege of having meat and drink at court free. The word is also written *bovge*, *bouge*, and *badge*; it is mere French, where it signifies *mouth*—The French still use the phrase, *Avoir bouche à la cour*; that is, *I have table or list at court*. This privilege is sometimes only extended to bread, beer, and wine: it was a custom anciently in use, as well in the houses of noblemen as in the king's court. Thomas earl of Lancaster retained Sir John de Ewre, to serve him with ten men at arms in time of war, allowing them *bouge of court*, with livery of hay and oats, horse-shoes and nails. Sir Hugh Merrill had the same privilege for life, on condition of serving king Edward II.

BOUCHET (John), a French poet and historian flourished in the 16th century. The most considerable of his writings are the Annals of Aquitaine, and his *Chapelet des Princes*.

BOUDRY, a small town of Switzerland, in the province of Neuchâtel, and capital of a châtelainry of the same name. E. Long. 7. 5. N. Lat. 47. 11.

BOVEY-COAL, an inflammable fossile found in England, France, Italy, Switzerland, Germany, Ireland, &c. Its colour is brown or brownish black, and of a laminar structure. It is composed of wood, penetrated by petrol or bitumen; and frequently contains pyrites, alum, and vitriol.

BOUFLERS (Lewis Francis, duke of), a peer and marshal of France, was born in 1644. He distinguished himself by his valour and conduct in several sieges and battles, and had the command of the right wing when the French were defeated at the bloody battle of Malplaquet. He died at Fountainbleau in 1711.—Marshal Boufflers, his son, died at Genoa, after having delivered that republic.

BOUGEANT (William Hyacinth), a famous Jesuit, first taught humanity at Caen and Nevers, and afterwards settled at the college of Lewis the Great, where he employed himself in writing several works; the principal of which were, 1. A collection of physical observations, extracted from the best authors. 2. An history of the wars and negotiations which preceded the treaty of Westphalia. 3. The female doctor, a philosophical amusement on the language of beads, &c. He died in 1743.

BOUGH, denotes much the same with *BRANCH*.—Green boughs anciently made part of the decoration of altars and temples, especially on festival occasions. Oaken boughs were offered to Jupiter; those of laurel, to Apollo; of olive, to Minerva; myrtle, to Venus; ivy, to Bacchus; pine, to Pan; and cypress, to Pluto. Some make them the primitive food of mankind before acorns were invented.

BOUGIE. In the French language it signifies a wax candle, and is applied to a machine which (as the wax candle formerly was) is introduced into the urethra for removing obstructions there. Mons. Daran, a French surgeon, lately boasted of his introducing them

as an improvement in his art, and acquired considerable profit by making and selling them. Scultetus, about the middle of the 17th century, used bougies in diseases of the urethra, and Mons. Daran probably took the hint from him. Different compositions have been used, and generally mercury was a part of them. Rivernus made a plaster as follows: R. ol. oliv. ℥i. vi. cam. citrin. ℥i. ii. massi & ceruss. āā ℥i. s. tereb. venet. & rez. alb. āā ʒi. iii. m. Whether the bougies are made up of this or any other composition, they must be of different sizes, from the bigness of a knitting needle to that of a goose quill. They are made of linen rags, spread with a proper matter, and then rolled up as follows. Having spread any quantity of the linen rag with the composition that is chosen for the purpose, cut it into slips from six to ten inches long, and from half an inch to an inch broad: then dextrously roll them on a glazed tile into the form of a wax candle: and as the end of the bougie that is to be entered first into the urethra should be somewhat smaller than the rest, it would be as well to cut the slips a little tapering. It should also be observed, that when the bougies are rolled up, that side must be outward on which the plaster is spread.

Mons. Daran, and some others, attributed the action of their bougies to the composition they made use of in forming them. Mr Sharp apprehended, that as much of their efficacy was owing to the compression they made on the affected part, as to any other principle; and Mr Aiken very justly says, As it is evident that bougies of very different compositions succeed equally well in curing the same disorders in the urethra, it is plain that they do not act by means of any peculiar qualities in their composition, but by means of some property common to them all. This must be their mechanical form and texture, therefore their mode of action must be simple compression. The efficacy of mere compression in many cases of constriction is well known, from the use of sponge tents for widening parts that are straitened by cicatrices: and admitting obstructions in the urethra to be from a constriction formed by cicatrized ulcers, or a projection of the spongy substance of the urethra into the canal, we may easily conceive, that a gentle continued elastic compression will in time overcome the disease. We may also readily account for the inferior efficacy of metallic and whalebone bougies, from their not having the property of swelling with moisture, and therefore not making so equal a compression. As to bougies procuring a discharge of matter, there is no doubt but the mechanical stimulus of a foreign body in such a tender part, though free from disease, must produce it in some degree; and that this will be varied according to the chemically irritating quality of the composition, and the irritable state of the urethra: but it seems absurdity to apply a topic, made uniform throughout, to the whole length of a canal, with a view of producing extraordinary effects upon a particular part of it, by means of some powerful quality in the ingredients. As to that part of the bougie which was in contact with the diseased part, being particularly covered with matter; this circumstance is probably owing to the greater irritation of that part of the urethra where the disorder is, than any other.

BOUHOURS (Dominic), a celebrated French critic, was born at Paris in 1628; and has been by some

Bougie,
Bouhours.

Not a
Dict.

Bouhours
||
Bovium.

considered as a proper person to succeed Malherbe, who died about that time. He was entered into the society of Jesuits at the age of 16; and was appointed to read lectures upon polite literature in the college of Clermont at Paris, where he had studied; but he was so incessantly attacked with the headach, that he could not pursue the destined task. He afterwards undertook the education of two sons of the duke of Longueville, which he discharged with great applause. The duke had such a regard for Bouhours, that he would needs die in his arms; and the "Account of the pious and Christian death" of this great personage was the first work which Bouhours gave the public. He was sent to Dunkirk to the Popish refugees from England; and in the midst of his missionary occupations, found means to compose and publish books. Among these were, *Entretiens d'Arifte & d'Eugene*, or "Dialogues between Aristus and Eugenus;" a work of a critical nature, and concerning the French language. His book was printed no less than five times at Paris, twice at Grenoble, at Lyons, at Brussels, at Amsterdam, at Leyden, &c. and embroiled him in quarrels with a great number of censors, with Menage in particular, who, however, lived in friendship with our author before and after. The fame of this piece, and the pleasure he took in reading it, recommended Bouhours so effectually to the celebrated minister Colbert, that he trusted him with the education of his son the marquis of Segnelai. He wrote afterwards several other works; the chief of which are, 1. Remarks and doubts upon the French language. 2. Dialogues upon the art of thinking well in works of genius. 3. The life of St Ignatius. 4. The art of pleasing in conversation. 5. The life of St Francis Xavier, apostle of the Indies and of Japan. This last work was translated from the French into English by Mr Dryden, and published at London in the year 1688, with a dedication prefixed to James II.'s queen.

BOUILLON, a town of France in the duchy of the same name, and in the county of Luxemburg, with a fortified castle. The French took it in 1676; upon which it was given to the duke of Bouillon; but the king keeps the castle to himself, which is seated on a rock that is almost inaccessible. E. Long. 5. 20. N. Lat. 49. 45.

BOUILLOX, in the manege, a lump or excrescence of flesh that grows either upon or just by the frush, inso-much that the frush shoots out, just like a lump of flesh, and makes the horse halt; and this is called *the flesh throwing upon the frush*. Manege horses, that never wet their feet, are subject to these excrescences, which make them very lame. See FRUSH.

BOVINA AFFECTIO, a dilemper of black cattle, caused by a worm lodged between the skin and the flesh, and perforating the same. This dilemper is not mentioned by the ancient Greeks, and is but little known in Europe.

BOVINES, a small town of the Austrian Netherlands, in the province of Namur, seated on the river Maese or Meuse, in E. Long. 4. 50. N. Lat. 49. 45.

BOVINO, an episcopal town of Italy, in the Capitanata, seated at the foot of the Apennine mountains, in E. Long. 16. 15. N. Lat. 41. 17.

BOVIUM, (Itinerary); a town of the Silures, in Britain, fifteen miles to the south of Isea Silurum, or

Caer-leon, in Monmouthshire: Now called *Cowbridge*; Boulainvilliers, Boulanger according to Baudrand, *Bangor* in Carnarvonshire.

BOULAINVILLIERS (Henry de), Lord of St Saife, and an eminent French writer, was descended from a very ancient and noble family, and born at St Saife in 1658. His education was among the fathers of the oratory; where he discovered from his infancy those uncommon abilities for which he was afterwards distinguished. He applied himself principally to the study of history; and his performances in this way are numerous and considerable. He was the author of a history of the Arabians; Fourteen letters upon the ancient parliaments of France; a History of France to the reign of Charles VIII.; the State of France, with historical memoirs concerning the ancient government of that monarchy, to the time of Hugh Capet, "written (says Mr Montesquieu) with a simplicity and honest freedom worthy of that ancient family from which their author was descended." Mr Boulainvilliers died at Paris in 1722; and after his death was published his Life of Mahomet.

BOULANGER (Nicholas-Anthony), a very singular Frenchman, was born at Paris in 1722, and died there in 1759, aged only 37. During his education, he is said have come out of the college of Beauvais almost as ignorant as he entered into it; but, struggling hard against his unaptness to learn, he at length overcame it. At seventeen, he began to study mathematics and architecture; and in three or four years made such a progress, as to be useful to the baron of Thiers, whom he accompanied to the army in quality of engineer. Afterwards he had the supervision of the highways and bridges; and he executed several public works in Champagne, Burgundy, and Lorraine. The author of his life, in the *Dictionnaire des Hommes celebres*, writes, that in this province a terrible spirit discovered itself in him, which he himself did not suspect before; and this was, it seems, the spirit of "thinking philosophically." In cutting through mountains, directing and changing the courses of rivers, and in breaking up and turning over the strata of the earth, he saw a multitude of different substances, which (he thought) evinced the great antiquity of it, and a long series of revolutions which it must have undergone. From the revolutions in the globe, he passed to the changes that must have happened in the manners of men, in societies, in governments, in religion; and he formed many conjectures upon all these. To be farther satisfied, he wanted to know what, in the history of ages, had been said upon these particulars; and, that he might be informed from the fountain-head, he learned first Latin and then Greek. Not yet content, he plunged into Hebrew, Syriac, Chaldaic, and Arabic; and acquired so immense an erudition, that, if he had lived, he would have been one of the most learned men in Europe: but death, as we have observed, prematurely took him off. His works are, 1. *Traite du Despotisme Oriental*, 2 vols 12mo; a very bold work; but not so bold and licentious as, 2. *L'Antiquite devoilee*, 3 vols 12mo. This was posthumous. 3. He furnished to the *Encyclopedie* the articles *Deluge*, *Corvee*, and *Societe*. 4. He left behind him in MS. a Dictionary, which may be regarded as a concordance in ancient and modern language. As a man, he is said to have been of a sweet, calm, and engaging

gaging temper; which, however, it is very difficult to reconcile with the dark, impetuous, ardent spirit, that appears to have actuated him as a writer.

BOULANGER (John), an engraver, who flourished towards the end of the last century, was a native of France. His first manner of engraving appears to have been copied, in some degree, from that of Francis de Poilly; but soon after he adopted one of his own, which, though not original, he however greatly improved: He finished the faces, hands, and all the naked parts of his figures, very neatly with dots instead of strokes, or strokes and dots. The effect is singular enough, and by no means unpleasing; only, in some few instances, he has opposed the coarse graving of his draperies, and back-ground, so violently to the neater work of the flesh, that the outline of the latter is thereby rendered hard, and the general appearance of it flat and chalky. This style of engraving has been carried to its greatest perfection in the present day, particularly in England. He did not draw the naked parts of his figures correctly, or with fine taste. His draperies are apt to be heavy, and the folds not well marked. However, his best prints possess much merit, and are deservedly held in great esteem.

BOULAY (Cæsar Egasse du), in Latin *Buleus*, was born at St Ellier, a village of Maine in France; and became professor of humanity at the college of Navarre, regifter, rector, and historiographer of the university of Paris. He died in 1678, after having published several works. The principal of them are, *A History of the University of Paris*, in Latin, 6 vols folio; and the *Treasure of Roman Antiquities*, in 1 vol. folio.

BOULCOLACA, among the modern Greeks, denotes the spectre of some wicked person who died excommunicated by the patriarch, reanimated by the devil, and causing great disturbance among the people; of which many strange stories are told. The word is Greek, and is sometimes written *βουκολακος*, *boukolakos*; and supposed to be derived from *βουρος*, or *βουρα*, "mud", and *λακος*, a "ditch", on account of the filthiness of the sight.

BOULDER-WALL, a kind of wall built of round flints or pebbles, laid in strong mortar, and used where the sea has a beach cast up, or where there are plenty of flints.

BOULETTE, in the manege. A horse is called *beulette*, when the fetlock, or pastern-joint, bends forward, and out of its natural situation, whether through violent riding, or by reason of being too short-jointed, in which case the least fatigue will bring it.

BOULLOGNE (Bon de), a painter of some eminence, was born at Paris in 1649. From his father Louis de Boullogne he learned the first principles of the art; but went to Rome in order to perfect himself from the works of the best masters. He abode in Italy five years. He excelled in history and portrait. His talents for copying the pictures of the great Italian painters were so very extraordinary, that he frequently deceived the greatest judges. He died at Paris in 1717, aged 68.

BOULLOGNE (Louis de), born at Paris in 1654, was the younger brother of the preceding; and like him learned from his father the first principles of painting, and afterwards went to Rome to complete his studies. His works, on his return, were so much

esteemed, that Louis XIV. honoured him with the order of St Michael, and, after the death of Antony Coypell, appointed him his principal painter. He chiefly excelled in historical and allegorical subjects. He died at Paris in 1734, aged 80 years.

BOULLONNE (Lewis), painter to the French king, and professor of the academy of painting, distinguished himself by his art; and died at Paris in 1674, aged 65. There are three of his pictures in the church of Notre Dame.—He left two sons who were admired for their skill in painting. The elder, who is well known under the name of *Bon Boullonne*, was first instructed by his father; after which he went to perfect himself in Italy, and for that purpose the king allowed him a pension: at his return, he was made professor of the academy of painting. Lewis XIV. employed him in adorning several of his palaces; and there are a great number of his pictures at Paris. His talents for copying the pictures of the great Italian masters were so very extraordinary, that he frequently deceived the greatest judges. He died in 1717.—*Lewis Boullonne* his brother, after being also instructed by his father, gained the prize of painting at 18 years of age; upon which he obtained the king's pension. He set out for Italy at his brother's return, and acquired great skill in designing and colouring. At his return to Paris he was much employed; and at length became director of the academy of painting, knight of the order of St Michael, and first painter to the king. Louis XIV. allowed him several pensions, and raised him and his posterity to the rank of nobility. He embellished the church of the Invalids, the chapel of Versailles, &c. and died at Paris in 1733.

BOULOGNE, a large and handsome town of Picardy in France, and capital of the Boulognois, with a harbour, and a bishop's see. It is divided into two towns; the higher, and the lower. The former is strong both by nature and art; and the latter is only surrounded with a single wall. The harbour has a mole for the safety of the ships, which at the same time prevents it from being choaked up. The lower town is inhabited by merchants, and has three large streets, one of which leads to the high town, and the other two run in a line on the side of the river. Many of the English and Scots reside here, who, from a rebellion, or any other cause, are obliged to fly from their native country. E. Long. 1. 42. N. Lat. 50. 42.

BOULOGNOIS, a territory of France, in the north part of Picardy, about 30 miles in length and 20 in breadth. The chief town is Boulogne, and the chief trade is in pit-coal and butter.

BOULTER (Dr Hugh), was born in or near London, of reputable and wealthy parents. He was educated at Merchant-taylor's school; and, before the Revolution, was from thence admitted to a commoner of Christ-church in Oxford. Some time after, he was chosen a demy of Magdalen college, at the same election with Mr Addison and Dr Wileox. From the merit and learning of the persons elected, this was commonly called by Dr Hough, president of the college, the *golden election*. He afterwards became fellow of the same college; in which station he continued in the university till he was invited to London by Sir Charles Hodges, principal secretary of state, in the year 1700, who made him his chaplain, and recommended him to Dr

Tenison archbishop of Canterbury; but his first preferments were owing to the earl of Sunderland, by whose interest and influence he was promoted to the parsonage of St Olave in Southwark, and the archdeaconry of Surry. Here he continued discharging very faithfully and diligently every part of his pastoral office, till he was recommended to attend George I. as his chaplain, when he went to Hanover in 1719. He had the honour to teach prince Frederic the English language; and by his conduct he so won the king's favour, that he promoted him to the deanery of Christ-church, and the bishopric of Bristol, in the same year. As he was visiting his diocese five years afterwards, he received a letter from the secretary of state, acquainting him that his majesty had nominated him to the archbishopric of Armagh and primacy of Ireland. This honour he would gladly have declined; and desired the secretary to use his good offices with his majesty to excuse him from accepting it. Ireland happened to be at this juncture in a great flame, occasioned by Wood's ruinous project; and the ministry thought that the bishop would greatly contribute to quench it by his judgment, moderation, and address. The king therefore laid his absolute commands upon him: to which he submitted, but with some reluctance. As soon as he had taken possession of the primacy, he began to consider that country, in which his lot was cast for life, as his own; and to promote its true interest with the greatest zeal and assiduity. Accordingly, in innumerable instances, he exerted himself in the noblest acts of beneficence and public spirit. In seasons of the greatest scarcity, he was more than once instrumental in preventing a famine which threatened that nation. On one of these occasions he distributed vast quantities of corn throughout the kingdom, for which the House of Commons passed a vote of public thanks; and at another time 2500 persons were fed at the poor-house in Dublin, every morning, and as many every evening, for a considerable time together, mostly at the primate's expence. When schemes were proposed for the advantage of the country, he encouraged and promoted them not only with his counsel but his purse. He had great compassion for the poor clergy of his diocese, who were disabled from giving their children a proper education; and he maintained several of the children of such in the university. He erected four houses at Drogheda for the reception of clergymen's widows, and purchased an estate for the endowment of them. His charities for augmenting small livings and buying glebes amounted to upwards of 30,000*l.* besides what he devised by will for the like purposes in England. In short, the instances he gave of his generosity and benevolence of heart, his virtue, his piety, and his wisdom, are almost innumerable, and the history of his life is his noblest panegyric. This excellent prelate died at London, on the 2d of June 1742, and was interred in Westminster-abbey, where a beautiful monument of finely polished marble is erected to his memory.

BOULTINE, a term which workmen use for a moulding, the convexity of which is just one-fourth of a circle; being the member just below the plinth in the Tuscan and Doric capital.

BOULUKE, in the military orders of the Turks, a body of the janizaries, with an officer in the place of a colonel at their head, sent upon some particular

enterprise; they are selected out of the body for this, and, as soon as the business is over, are received again into their former companies.

BOUM (anc. geog.), a town in Ethiopia beyond Egypt, on the west side of the Nile.

BOUM SOLIS STABULA (anc. geog.), the territory of Myla, so called: A peninsula on the east coast of Sicily, to the north of Syracuse; remarkable for its fertility and rich pastures (Theophrastus): and hence arose the fable of the oxen of the sun feeding there (Scholiast on Apollonius). Pliny and Seneca say, that something like dung is thrown out on the coast of Myla and Messana, which gave rise to the fable of the oxen of the sun being stalled there; and at this day the inhabitants affirm the same thing (Cluverius).

BOUNCE, in ichthyology, the English name of a species of squalus. See **SQUALUS**.

BOUND, in dancing, a spring from one foot to the other; by which it differs from a hop, where the spring is from one foot to the same. It also differs from a half coupee, as in the latter the body always bears on the floor, either on one foot or the other; whereas, in the bound, it is thrown quite from the floor.

BOUND-BAILIFFS, are sheriffs officers for executing of process. The sheriffs being answerable for their misdemeanors, the bailiffs are usually bound in a bond for the due execution of their office; and thence are called *bound-bailiffs*, which the common people have corrupted into a much more homely appellation.

BOUNDS OF LANDS. See **ABUTTALS**.

BOUNTY, in commerce, a premium paid by government to the exporters of certain British commodities, as sail-cloth, gold and silver lace, silk-stockings, fish, corn, &c. The happy influence which bounties have on trade and manufactures is well known: nor can there be a more convincing proof of the good intentions of the government under which we live, than the great care that is taken to give all possible encouragement to those who shall establish or improve any hazardous branch of trade.

All undertakings, in respect either to mercantile enterprises, or in the establishment of manufactures, are weak and feeble in their beginnings; and if unsuccessful, either sink entirely, or at least are seldom revived in the same age. Accidents of this nature are not only destructive to private persons, but exceedingly detrimental to the public interest. On this principle, more especially since trade, for which Providence designed us, hath been attended to, such attempts have been thought deserving, and have been favoured with, public support. This in former times usually flowed from the crown, in the form of letters-patent, charters, or other grants of privileges, which, however requisite they might be, were notwithstanding very frequently objects of censure. If such as obtained them failed in their endeavours, they were reputed *projectors*; if, on the other hand, they succeeded, they were considered as *monopolizers*. Corporations, which imply the uniting certain individuals into a body, that they may thereby become more useful to the community, are created by the crown. Many of these were formed for promoting trade; and, according to the old system of our government, were necessary and useful. On the same principle, privileges were granted to private persons,

Britain.

sons, on a suggestion, that what was immediately of use to them would terminate in public utility. These also did good in bringing in many arts and manufactures; though, in some cases, tending to private interest more than public emolument, they were liable to legal correction. In later times, and in concerns of moment, a much better method has been adopted, as often as it hath been found practicable, by rejecting private or particular interest, and proposing the designed advantages to such as should perform the stipulations on which they are granted. These bounties, as they are paid by the public, so they are solely calculated for the benefit of the public. They are sometimes given to encourage industry and application in raising a necessary commodity; which was intended by the bounty on exporting corn. The intention of this bounty was to encourage agriculture; and the consequence hath been, that we now grow more than twice as much as we did at the establishment of the bounty; we even consume twice as much bread as we then grew; yet in A. D. 1697, we exported a fifteenth part of what we grew, of late years a twenty-ninth part only. The bounty on this twenty-ninth part amounted to somewhat more than L. 50,000, and the produce to more than L. 400,000. It is evident that all this is so much clear gain to the nation. But this is far from being all that we have annually gained. For if our cultivation is doubled, as indeed it is, then the rent of lands, the subsistence of working hands, the profits of the tradesmen supplying them with utensils, clothes, the value of horses employed, &c. must all be taken into the account. Besides this we must add the freight (amounting to half the bounty), to make the idea of the advantages complete.

Sometimes bounties are given with a view to promote manufactures, as in the case of those made of silk. Many laws are to be found in our statute-books in favour of the silk manufacture, made with great wisdom and propriety, for the encouragement and support of many thousands of industrious persons employed therein. By statute 8 Geo. I. cap. 15. § 1. a bounty was given on the due exportation of ribbons and stuffs, of silk only, of three shillings upon a pound weight; silks, and ribbons of silk, mixed with gold and silver, four shillings a pound; on silk gloves, silk stockings, silk fringes, silk laces, and sewing silk, one shilling and threepence a pound; on stuffs of silk and grogram yarn, eightpence a pound; on silks mixed with wool or cotton, one shilling; on stuffs of silk mixed with worsted, sixpence a pound, for three years: and, from experience of their utility, these were continued by subsequent statutes.

Sometimes bounties are given to support a new manufacture against foreigners already in possession of it, as in making linen and sail-cloth. The promoting of the manufacture of British sail-cloth was undoubtedly a very important national object, as the consumption was very large, and of consequence the purchase of it from foreigners an heavy expence on the public. Many methods were therefore devised, and countenanced by law, both here and in Ireland, for introducing and encouraging our own in preference to that of strangers, more especially in the royal navy. By stat. 12 Anne, cap. 16. § 2. a bounty was given of one penny per ell on all that was exported for a term, and continued by subsequent statutes. By 4 Geo. II. cap. 27. § 4. an

additional bounty of another penny an ell is granted. These bounties were to be paid out of an additional duty on imported sail-cloth. By the same statute every ship built in Britain, or in the plantations, is, under the penalty of L. 50, to be furnished with a complete suit of sails of British manufacture. The amount of these bounties mark the progress of the manufacture, which is also assisted by the fund on which the payment is assigned.

These assistances, however, are never bestowed but on mature deliberation, in virtue of strong proofs, and with a moral certainty of a national benefit. The great intention of bounties is to place the British trader on such ground as to render his commerce beneficial to his country. In order to this, some profit must accrue to himself, otherwise he would not embark therein; but this, whatever it be, must prove inconsiderable in comparison of what results to the public. For if, by the help of such a bounty, one or many traders export to the value of 1000, 10,000, or 100,000 pounds worth of commodities or manufactures, whatever his or their profit or loss (for the latter, through avidity and overloading the market, sometimes happens) may be, the nation gains the L. 1000, L. 10,000, or L. 100,000; which was the object of the legislature in granting the bounty. Upon this consideration, that the entire produce of what is exported accrues to the nation, the legislature, when an alteration of circumstances required it, have made no scruple of augmenting a bounty; as in the case of refined sugar exported, from three to nine shillings per hundred weight. In like manner, the original bounty of one pound per ton in favour of vessels employed in the whale-fishing hath been doubled, and many new regulations made, in order to render this fishery more advantageous to the public. As a bounty is given on malt when allowed to be exported, so an equivalent of 30 shillings per ton hath been granted on all British made malt-spirits when exported, which is a common benefit to land, manufacture, and commerce.

It is indeed true, that on whatever account, or to whatever amount, this reward is given, the public seem to pay, and private persons seem to receive. But these private persons receive it as the hire from the public, for performing a service which otherwise they would not perform, the benefit of which accrues to the public, and who can therefore very well afford to pay that reward in reality, which, as we have stated it, the only seems to do. For, looking a little closer, we cannot help observing, that the bounty is paid to individuals, who, as such, make a part of the public. But the commodities or manufactures exported are sold to foreigners; and the whole produce of them, be it what it will, comes into the purse of the public. By attending to this self-evident doctrine, every reasonable and public-spirited man will be easily reconciled to bounties; and the three following considerations will be sufficient to obviate the most common objections that have been made to the practice of giving them. 1. That no bounty can be desired but on the plea of national utility, which always deserves notice, and cannot be mistaken. It must likewise be alleged and proved, that this is the only means whereby the national benefit can be attained. 2. The sums issued on this account not only show the clear expence of the bounty, but also indicate the profit gained by the public; for as the one

Bounty
of
Bourbon.

cannot exist without the other, that amount must be the incontestable index of both. 3. It must be remembered (and of this too some instances might be given), that if bounties should be improperly bestowed, they will of course prove ineffectual, and after a few fruitless trials will remain unclaimed, and consequently produce no expence. There is indeed another objection which hath been made against the giving of bounties. This is grounded on the frauds to which they are supposed to be liable; and particularly the relanding of the goods on which the bounty hath been paid, and thereby deceiving and cheating the public. But whoever peruses the laws made on this head, and attentively considers the numerous precautions taken to fix every circumstance relative to the obtaining the bounty, the checks on the shipping of goods, the securities taken for their due exportation, the certificates required to ascertain their being actually delivered and sold in a foreign market, must be convinced, that to discharge all those securities, in case of an intended fraud, is a thing very difficult, if not impossible.

To these remarks we may add, that bounties are usually granted only for a limited time, and then expire; are always liable to be suspended; and of course can never be the cause of any great national loss. There is no doubt that, exclusive of frauds, the immoderate thirst of gain may tempt interested men to aim at converting what was calculated for public benefit to its detriment, for their own private advantage. Thus, on a prospect of short crops in other countries, men may take measures within the letter, but directly against the spirit, of the law, to send so much of our corn abroad as to endanger a famine at home. For this the wisdom of parliament provides, not barely by suspending the bounty, but by prohibiting exportation and opening the ports for foreign supplies. We cannot with any shadow of justice ascribe scarcity to the bounty on the exportation. If this was the case, suspensions would be frequent, whereas there have been but five in a course of 70 years. If the bounty had any share, the larger the exportation, the greater would be the scarcity. In A. D. 1750 we exported more than one fifth of our growth of wheat, which was notwithstanding but at four shillings per bushel; whereas a century before, A. D. 1650, when we had neither bounty nor exportation, wheat was at nine shillings and sixpence per bushel. The causes of scarcity are unkindly seasons; which though human policy cannot prevent, yet their sad effects have been evidently lessened by our increased growth, since the taking place of bounty and exportation.

Queen Anne's BOUNTY, for augmenting poor livings under L. 50 *per annum*, consists of the produce of the first-fruits and tenths, after the charges and pensions payable out of the same are defrayed. A corporation for management of the same was settled, &c. in 1704. See AUGMENTATION.

BOURBON, or MASCARENHAS, (isle of), an island in the Indian ocean, lying to the east of Madagascar, in E. Long. 58. 30. S. Lat. 21. 23. This island has no port, and is in some places inaccessible. Its length and breadth have not been well determined; but the circumference, according to the account of a person who resided there some time, is about 57 leagues. It is for the most part mountainous, but in some places

there are very beautiful and fertile plains. In the south part of the island there is a burning mountain, which has thrown out vast quantities of bitumen, sulphur, and other combustible materials; neither does it cease throwing them out still, so that the country about it is useles, and is called by the inhabitants *payz brule*, that is, burnt land. The shore is high and rocky all round; but though on this account it hath no ports, there are several good roads, particularly one on the west, and another on the north-east. As to its form, this island is irregular, so that it is difficult to judge from the maps whether it is round or long. The air is equally pleasant and wholesome, inasmuch that the people live to a great age without feeling either infirmities or diseases. This is occasioned by the hurricanes, of which they have one or two every year. These purge and cleanse the air, so as to render it highly salubrious; the certainty of which is thus distinguished, that when they fail of making their annual visits, as sometimes they do, diseases and death find an entrance into the island, which otherwise would soon be overstocked with inhabitants. The climate is hot, but not to such a degree as might be expected from its situation, the breezes from the mountains being constant and very refreshing. The tops of these mountains are in winter covered with snow; which, melting in the summer, furnishes abundance of rivers and rivulets, with which the country is plentifully watered: so that the soil, though not very deep, is wonderfully fruitful, producing Turkey corn and rice twice a-year, and the latter in great abundance. Most sorts of cattle are found here, good in their kind, and are very cheap; wild goats and wild hogs are found in the woods and on the tops of the mountains; here also are vast quantities of wild fowl of different kinds, fish, and land tortoises, affording at once the most delicate and wholesome food. As to fruits, they have bananas, oranges, citrons, tamarinds, and other kinds; neither does it want valuable commodities, particularly ebony, cotton, white pepper, gum benzoin, aloes, and tobacco; all excellent in their kind, when compared with those of other countries. This island is also happy in its deficiencies; for no animals that are venomous are to be found therein, and only two sorts that are disagreeable to the sight, *viz.* spiders of the size of a pigeon's egg, which weave nets of a surprising strength, reckoned by some capable of being treated so as to become as valuable as silk; and bats of a most enormous size, which are not only skinned and eaten, but esteemed also the greatest delicacy that they have.

The island of Bourbon was discovered by the Portuguese in 1545, as appears by a date inscribed by them upon a pillar when they first landed; but when the French settled in Madagascar, this island was totally desolate. Three Frenchmen being banished thither, and left there for three years, made such a report of it at their return as surprised their countrymen. They lived most of that time upon pork; and though they were in a manner naked, yet they affirmed that they never had the least pain or sickness whatever. This tempted one Anthony Taureau to go over thither in 1654, accompanied by seven French and six negroes, who carried with them the cattle from which the island has been stocked ever since. The first thing they did was to erect the arms of France, by order of Mr

Falcourt

Bourbon.

Bourbon. Faleourt who was governor of Madagafcar, and to beflow upon the ifland a new name. Then they fet up huts, and laid out gardens, in which they cultivated melons, different forts of roots, and tobacco; but juft as the laft became ripe, the whole plantation was deftroyed by a hurricane. The French, however, went to work again; and by having fome acquaintance with the climate, fucceeded better, and added aloes to the reft of their plantations: but receiving no fuccour from Madagafcar, and being tired of living by themfelves in the ifle of Bourbon, they very readily embraced the offer of an English captain, and in the year 1658 embarked for Madraf. When the laft great blow was given to the French at Madagafcar by the natives, who furprifed and cut them off in one night, there efaped as many men, as with their wives, who were natives, filled two canoes; and thefe being driven by the wind on the ifle of Bourbon, were the next fet of people who inhabited it. This laft colony, for want of an opportunity to remove, were conftained to cultivate this new country of theirs, and to remain in it. It was not long before a further flock of inhabitants arrived. A pirate that had been committing depredations in the Indies, returning to Europe, ran afhore and was fplit to pieces upon the rocks, fo that the crew were forced to join themfelves to the former inhabitants; and as they had on board their vefel a great many Indian women whom they had made prifoners, they lived with them, and in procefs of time had a numerous pofterity. As Eaft India fhips touched frequently here, when too late to double the Cape, many of the failors, for the fake of the women, deferted at the time of their departure, and flaying behind became planters in the ifle of Bourbon. As the place grew more populous, the people naturally became more civilized, and defirous of living in a more commodious manner; which induced them to build fmall vefels, that in thefe they might fometimes make a trip to Madagafcar, in order to purchafe flaves, whom they employed in their plantations to cultivate aloes, tobacco, and other things, with which they drove a fmall trade, when fhips of any nation anchored in their roads for the fake of refrefhments. In this fituation they were, when the French Eaft India company put in their claim; and affuming the property of the ifland, fent thither five or fix families and a governor. At firft the inhabitants expected to reap fome benefit from their new mafters; but finding very little, and thinking the governor took too much upon him, they revolted at the infligation of a prieft, feized their governor and put him into a dungeon, where he died of hunger and grief. For this fome of the ringleaders were punifhed, a kind of fort was erected, fome guns placed on it, and the French flag kept flying; but in other refpects, fo little care was taken, that, till within thefe 40 years, the ifland was in no ftate of defence.

The number of inhabitants, in the year 1717, was computed at 2000; viz. 900 free, and 1100 flaves. Amongft thefe people the ufual diftinction of whites and blacks entirely fails: for even the free are of different colours; and a French writer affures us, that he faw in a church one family, confifting of five generations, of all complexions. The eldeft was a female, 108 years of age, of a brown black, like the Indians of Madagafcar; her daughter, a mulatto; her grand-daughter, a miftrizo; her

great-grand-daughter, of a dufty yellow; her daughter, again, of an olive colour; and the daughter of this laft, as fair as any English girl of the fame age. Thefe people are, generally fpeaking, of a gentle quiet difpofition; very induftrious; and fubmiffive enough to authority, provided it is exercifed with a tolerable degree of equity and decency; for otherwife the whole of them are apt to rife in rebellion at once; and the flaves have fo little reafon to complain of their mafters, that they are always on the fame fide. The ifland is divided into four quarters. The firft is that of St Paul, which is the largell and beft peopled: their houfes are built at the foot of a fleep mountain, on both fides of a freth water lake. As for the plantations, they are on the top of a mountain, which they afcend by a very rough and troublefome paffage. On the fummit there is a fpacious plain, a great part of which is divided into plantations of rice, tobacco, corn, fugar, and fruits. The quarter of St Dennis lies feven leagues from that of St Paul, towards the ead; and there the governor refides. It is not fo well peopled as the former; but the country is more pleafant, and the fituation better. At two leagues diftance, proceeding along the fea coaft, is the quarter of St Mary's, which is but thinly peopled. The laft and moft fertile quarter is that of St Sufannah, which is at the diftance of four leagues from St Dennis. The road between thefe two quarters is tolerable, though part of it has been cut with much difficulty through a wood: but the paffage from St Dennis to St Paul is only by fea.

When the prefent company of India became, by their perpetual eftablifhment, poffeffed of the ifland of Bourbon, they began to improve it exceedingly: rai- fing new forts and batteries, fo as to render it in a manner inacceffible; and importing coffee-trees from Arabia, which have fucceeded fo well, that it is believed they produce an eighth, according to fome a fixth, part as much coffee as is raiſed in the kingdom of Yemen in Arabia, and it is likewise held next in goodnefs to that. — In 1763, the population amounted to 4627 white people, and 15149 blacks; the cattle confifted of 8702 beeves, 4084 fheep, 7425 goats, and 7619 hogs. Upon an extent of 125,909 acres of cultivated land, they gathered as much callava as would feed their flaves, 1,135,000 pounds weight of corn, 844,100 pounds of rice, 2,879,100 pounds of maize, and 2,535,100 pounds of coffee; which laft the company bought up at about 3 d. per pound.

In 1748, Admiral Bofcawen appeared before this ifland with a Britifh fleet; but found it fo well fortified both by nature and art, that he was obliged, after fome cannonading to very little purpofe, to purfue his voyage.

BOURBON (Nicholas), a famous Latin poet in the 16th century, was a native of Vandœuvre near Langres, and the fon of a wealthy man who was mafter of feveral forges. Margaret de Valois appointed him preceptor to her daughter Jane d'Albret of Navarre, the mother of King Henry IV. At length he retired to Conde, where he had a benefice, and died about the year 1552. He wrote eight books of Epigrams; and a poem on the forge, which he has intitled *Ferraria*. He had great knowledge of antiquity and of the Greek language. Erasmus praifes his epigrams.

BOURBON (Nicholas), a celebrated Greek and Latin poet.

Bourbon
||
Bourchier.

poet, was nephew of the preceding. He taught rhetoric in several colleges of Paris; and the cardinal de Perron caused him to be nominated professor of eloquence in the Royal College: he was also canon of Langres, and one of the 40 of the French academy. At length he retired to the fathers of the oratory, where he died in 1644, aged 70. He is esteemed one of the greatest Latin poets France has produced. His poems were printed at Paris in 1630.

BOURBON-Lancy, a town of France, in the duchy of Burgundy, and in the Autunnois. It is remarkable for its castle and baths; and there is a large marble pavement, called the *great bath*, which is a work of the Romans. It is seated near the river Loire, in E. Long. 3. 46 N. Lat. 46. 37.

BOURBON L'Archevaul, a small town of France, remarkable for its baths, which are exceedingly hot. E. Long. 3. 28. N. Lat. 46. 35.

Family of BOURBON are the reigning princes in the kingdom of France. Henry IV. in 1589, though of the 10th generation, was the nearest heir; and succeeded Henry III. (the last of the Valois race), whose brother Francis II. married Mary Queen of Scots, and both died without issue. Louis XVI. is the 5th king of this family in succession. This family also mounted the throne of Spain in 1700, by Philip V. grandson to Louis XIV. which was the occasion of the long and bloody war that ended in the peace of Utrecht. A branch of the Spanish family likewise mounted the throne of the two Sicilies in 1734. These three branches entered into a treaty offensive and defensive in 1761, which goes by the name of the *family compact*.

BOURBONE-LE-BAINS, a town of France in Champagne, and in the Baligni, famous for its hot baths. E. Long. 5. 45. N. Lat. 47. 54.

BOURBONNOIS, a province of France, with the title of a duchy; bounded on the north, by Nivernois and Berry; on the west, by Berry and a small part of upper Marche; on the south by Auvergne; and on the east, by Burgundy and Forez. It abounds in corn, fruits, pastures, wood, game, and wine. Its principal town is Moulins; and the rivers are the Loire, the Allier, and the Cher.

BOURBOURG, a town in French Flanders, whose fortifications are demolished. It is seated on a canal that goes to Dunkirk, in E. Long. 2. 15. N. Lat. 50. 55.

BOURCHIER (John), lord Bemars, grandson and heir of a lord of the same name, who was descended from Thomas of Woodstock, duke of Gloucester, and had been knight of the Garter, and constable of Windsor-castle, under Edward IV. Our lord John was created a knight of the Bath, at the marriage of the duke of York second son of Edward IV. and was first known by quelling an insurrection in Cornwall and Devonshire, raised by Michael Joseph, a blacksmith, in 1495, which recommended him to the favour of Henry VII. He was captain of the pioneers at the siege of Therouanne, under Henry VIII. by whom he was made chancellor of the exchequer for life, lieutenant of Calais and the Marches, appointed to conduct the lady Mary the king's sister into France on her marriage with Louis XII. and had the extraordinary happiness of continuing in favour with Henry VIII. for the space of 18 years. He died at Calais in 1532, aged 63. He translated, by king Henry's command, Froissart's Chro-

nicle; which was printed in 1523, by Richard Pinfon, Bourdaloue, the scholar of Caxton, and the first on the list of English printers. His other works were a whimsical medley of translations from French, Spanish, and Italian novels, which seem to have been the mode then, as they were afterwards in the reign of Charles II. These were, The life of Sir Arthur, an Armorican knight; The famous exploits of Sir Hugh Bourdeaux; Marcus Aurelius; and, The cattle of love. He composed also a book, of the duties of the inhabitants of Calais; and a comedy entitled *Ite in Vincam*, which is mentioned in none of our catalogues of English plays. Anthony Wood says it was usually acted at Calais after vespers.

BOURDALOUE (Lewis), a celebrated preacher among the Jesuits, and one of the greatest orators France has produced, was born at Bourges, on the 20th of August 1532. After having preached at Provence, he, in 1699, went to Paris; and there met with such applause, that the king resolved to hear him: on which he was sent for to court, and frequently preached before Louis XIV. He assisted the sick, visited the prisoners and hospitals, and was very liberal in giving alms. He died at Paris on the 13th of May 1704. The best edition of his sermons is in octavo.

BOURDEAUX, an ancient, large, handsome, and rich town of France, capital of Guienne, an archbishop's see; has an university and an academy of arts and sciences. It is built in the form of a bow, of which the river Garonne is the string. This river is bordered by a large quay, and the water rises four yards at full tide, for which reason the largest vessels can come up to it very readily. The castle called the *Trumpet* is seated at the entrance of the quay, and the river runs round its walls. Most of the great streets lead to the quay. The town has 12 gates; and near another castle are fine walks under several rows of trees. The ancient city of Bourdeaux, though considerable in point of size, was ill built, badly paved, dangerous, without police or any of those municipal regulations indispensably requisite to render a city splendid or elegant. It has entirely changed its appearance within these last thirty years. The public edifices are very noble, and all the streets newly built are regular and handsome. The quays are four miles in length, and the river itself is considerably broader than the Thames at London bridge. On the opposite, a range of hills, covered with woods, vineyards, churches, and villas, extends beyond the view. Almost in the centre of the town is a fine equestrian statue in bronze erected to the late king in 1743, with the following inscription:

*Ludovico quiddecimo,
Sæpe victori, semper pacificatori;
Suos omnes, quam latè regnum patet,
Paterno pectore gerenti;
Suorum in annis pentus habitanti.*

The beauty of the river Garonne, and the fertility of the adjoining country, were probably the causes which induced the Romans to lay the foundations of this city. The ruins of a very large amphitheatre yet remain, constructed under the emperor Gallienus; it is of brick, as are most of the edifices of that period, when the empire was verging to its fall, and the arts began rapidly to decline. During the irruptions of the barbarous nations, and particularly in those which the Normans repeatedly made, Bourdeaux was ravaged, burnt, and almost

Bordeaux most entirely destroyed. It only began to recover again under Henry II. of England, who having united it to the crown by his marriage with Eleanor of Aquitaine, rebuilt it, and made it a principal object of his policy, to restore the city again to the lustre from which it had fallen. The Black Prince received all Guienne, Gascony, and many inferior provinces in full sovereignty from his father Edward III. he brought his royal captive, John king of France, to this city, after the battle of Poitiers in 1356; and held his court and residence here during eleven years. His exalted character, his uninterrupted series of good fortune, his victories, his modesty, his affability, and his munificence, drew strangers to Bourdeaux from every part of Europe; but all this splendor soon disappeared. He lived to experience the ingratitude of Pedro the Cruel, to whom he had restored the kingdom of Castile; he became a prey to distempers in the vigour of life; he saw his dominions reunited again in many of their branches to the crown of France, by Charles V.; he lost his eldest son Edward, a prince of the highest expectations; and at length, overcome with sorrow at this last affliction, he quitted Bourdeaux, and re-embarked for England, there to expire a memorable example of the hasty revolution of human greatness! In 1453, Charles VII. king of France, re-entered the city, and subjected the whole province of Guienne, which had been near three centuries under the English government. Conscious of the importance of such a conquest, he ordered the Chateau Trompette to be built to defend the passage of the river; and Louis the XIV. afterwards employed the celebrated Vauban to erect a new fortress, in the modern style of military architecture, on the same spot.—Madame de Maintenon, whom fortune seemed to have chosen as the object of her extremest rigour and extremest bounty, was removed from the prisons of Niort in Poitou where she was born, with her father the Baron d'Aubigné, to this castle, where she used to play with the daughter of the turnkey, in the greatest indigence. Bourdeaux presents few remains of antiquity. The cathedral appears to be very old, and has suffered considerably from the effects of time. The unfortunate duke of Guienne, brother to Louis the XI. who was poisoned in 1473, lies buried before the high altar. The adjacent country, more peculiarly the *Pays de Medoc*, which produces the finest clarets, is exceedingly pleasant, and at the season of the vintage, forms one of the most delicious landscapes in the world. W. Long. 0. 39. N. Lat. 44. 50.

BOURDELOT (John), a learned French critic, who lived at the close of the 16th and beginning of the 17th centuries. He distinguished himself by writing notes on Lucian, Petronius, and Heliodorus; by an Universal History; Commentaries on Juvenal; a Treatise on the Etymology of French words; and by some other works which were never published.—There was also an abbe Bourdelot, his sister's son, who changed his name from Peter Michon to oblige his uncle. He was a celebrated physician at Paris, who gained great reputation by a Treatise on the Viper, and other works. He died in 1685.

BOURDINES, a town of the Austrian Netherlands, in the province of Namur. F. Long. 5. 0. N. Lat. 50. 35.

BOURDON (Sebastian), a famous painter, born at Montpellier, in 1619. He studied seven years at Rome; and acquired such reputation, that at his return to France he had the honour of being the first who was made rector of the academy of painting at Paris. He succeeded better in his landscapes than in his history-painting. His pieces are seldom finished; and those that are so, are not always the best. He once laid a wager with a friend, that he should paint 12 heads after the life, and as big as the life, in one day. He won it; and these are said not to be the worst things he ever did. His most considerable pieces are, The gallery of M. de Bretonvilliers, in the isle of Notre Dame; and, The seven works of mercy, which he etched by himself. But the most esteemed of all his performances is, The martyrdom of St Peter, drawn for the church of Notre Dame: It is kept as one of the choicest rarities of that cathedral. Bourdon was a Calvinist; much valued and respected, however, in a Popish country, because his life and manners were good. We have also by this master a great number of etchings; which are executed in a bold, masterly style, and much more finished than those we generally meet with from the point of the painter. They are justly held in the highest estimation by the generality of collectors. He died in 1673, aged 54.

BOURDONNET, in heraldry, the same with **POMER**.

BOURG, the capital of the island of Cayenne, a French colony on the coast of Guiana, in South America; in W. Long. 52. 0. N. Lat. 5. 0.

Bourg-en-Bresse, a town of France, and capital of Bresse, in the province of Burgundy. It is seated on the river *Reffouffe*, almost in the centre of Bresse, in E. Long. 4. 19. N. Lat. 46. 13.

Bourg-sur-Mer, a sea-port town of France in Guienne, and in the Bourdelois, with a tolerable good harbour: seated at the confluence of the rivers *Dordogne* and *Garonne*, in W. Long. 3. 35. N. Lat. 45. 0.

BOURGES, an ancient and large town of France, the capital of Berry, an archbishop's see, and a famous university. The archbishop assumes the title of *Patriarch of the Aquitains*, and enjoys the rights of primacy with regard to Albi. It is seated between two small rivers, the *Evry* and the *Orron*, upon a hill that has a gentle descent down to these rivers, by which it is almost surrounded, for there is but one avenue to it by land, which is that of *Port Bourbonnoux*. It stands upon a great deal of ground; but one part of it is without houses; and the rest is but thinly peopled with gentlemen, students, and ecclesiastics, the whole number of souls amounting only to about 1800. They have no manner of trade but for their own necessities. It is divided into the old and new town. The walls of the old are almost entire, and the new town is almost as large as the old. There are several churches, convents, and nunneries. The parish church, dedicated to St Stephen, is a fine old Gothic structure: it is seated on the highest part of the city, and on each side of the front are two handsome high towers. The new one, which is built in the room of one which fell down, is almost 200 feet high. *Bourbon square* is the largest in the city, where there was formerly an amphitheatre, and now a market. There is a fine walk from St Michael's-gate into the fields, and three alleys, formed by four ranks of trees, the middlemost of which is spacious; besides which, there is a very long mall. The university is famous

Bourdon
Bourges.

Bourget
||
Bourgogne.

mous for the study of the law. This city stands almost in the centre of France. E. Long. 2. 30. N. Lat. 47. 10.

BOURGET (Dom. John), an ingenious French antiquary, was born at the village of Beaumains near Falaise, in the diocese of Seez, in 1724. He was educated at the grammar-school at Caen, whence he was removed to that university, and pursued his studies with great diligence and success till 1745, when he became a Benedictine monk of the abbey of St Martin de Seez. Some time after this, he was appointed prior claustral of the said abbey, and continued six years in that office, when he was nominated prior of Tiron en Perche: whence being translated to the abbey of St Stephen at Caen, in the capacity of sub-prior, he managed the temporalities of that religious house during two years, as he did their spiritualities for one year longer; after which, according to the custom of the house, he resigned his office. His superiors, sensible of his merit and learning, removed him thence to the abbey of Bec, where he resided till 1764. He was elected an honorary member of the Society of Antiquaries of London, Jan. 10. 1765; in which year he returned to the abbey of St Stephen at Caen, where he continued to the time of his death. These honourable offices, to which he was promoted on account of his great abilities, enabled him not only to pursue his favourite study of the history and antiquities of some of the principal Benedictine abbeys in Normandy, but likewise gave him access to all their charters, deeds, register-books, &c. &c. These he examined with great care, and left behind him in MS. large and accurate accounts of the abbeys of St Peter de Jumieges, St Stephen, and the Holy Trinity at Caen (founded by William the Conqueror and his queen Matilda), and a very particular history of the abbey of Bec. These were all written in French. The "History of the Royal Abbey of Bec" (which he presented to Dr Ducarel in 1764) is only an abstract of his larger work. This ancient abbey (which hath produced several archbishops of Canterbury and other illustrious prelates of this kingdom) is frequently mentioned by our old historians. The death of our worthy Benedictine (which happened on new-year's day 1776) was occasioned by his unfortunate neglect of a hurt he got in his leg by falling down two or three steps in going from the hall to the cloister of the abbey of St Stephen at Caen, being deceived by the ambiguous light of a glimmering lamp that was placed in that passage. He lived universally esteemed, and died sincerely regretted by all those who were acquainted with him; and was buried in the church of the said abbey, Jan. 3. 1776.

BOURGET, a town of Savoy, subject to the king of Sardinia, seated at the southern extremity of a lake of the same name. E. Long. 5. 55. N. Lat. 45. 45.

BOURGOGNE, or **BURGUNDY**, as we call it; a considerable province of France with the title of a duchy. It is 130 miles in length, and 75 in breadth. It is bounded on the east, by the Franche Comte; on the west, by Bourbonnois and Nivernois; on the south, by Lyonnois; and on the north by Champagne. It is very fertile in corn and fruit, and produces excellent wine. It is watered by the rivers Seine, Dêhune, Bre-

bince, Armançon, Ouche, Souzon, Tille, and Saone. There are four mineral springs at Apoigny, Primeau, Bourbon-Lancy, and St Reine. The first are obscure, and the two last in high reputation. In the canton of Bresse, there are two subterranean lakes which often overflow in times of the greatest drought, and lay a large tract of ground under water: one of them has no apparent spring or opening; and yet in a dry season, it throws out water enough to overflow the meadow-land near it. The grottos or caves of Arcy are seated about 18 miles from Auxere, and over them is soil about 10 feet deep. The entrance into these cavities is 200 paces long, but narrow. There are arches which form several vaults, from whence drop clear water, which turns into a brilliant hard stone. Twenty paces from the entrance is a lake, which seems to be formed by that part of the water that will not petrify. The highest of these vaults is not above eight feet. About 80 paces from the entrance there is a kind of hall, with a coffee-coloured ceiling, wherein there are a thousand odd figures, which have a very agreeable effect. Dijon is the capital town.

BOURGUIGNONS, or **BURGUNDIANS**, one of the northern nations who over-ran the Roman empire, and settled in Gaul. They were of a great stature, and very warlike; for which reason the emperor Valentinian the Great engaged them in his service against the Germans. They lived in tents which were close to each other, that they might the more readily unite in arms on any unforeseen attack. These conjunctions of tents they called *burghs*; and they were to them what towns are to us. Sidonius Apollinaris tells us, that they wore long hair, took great pleasure in singing, and were fond of praise for their vocal talents. He adds, that they ate great quantities; and anointed their hair with butter, deeming that unction very ornamental. Their crown was at first elective, and the authority of their kings expired with their success. They were not only accountable for their own misconduct, but likewise for the calamities of nature, and the caprice of fortune. They were deposed if they had lost a battle; if they succeeded ill in any enterprise; or if, in short, any great event had not corresponded with the hopes of the public. They were not more favourably treated in case of a bad harvest or vintage, or if any epidemical distemper had ravaged the state. At first they were governed by many kings, and *benlin* was the title of the royal dignity. But in latter times they were subjected to one sovereign; and they grew humane and civilized, especially when Christianity was propagated in their country. Before that epocha, their religion was much the same with that of the other northern nations. They had many priests, the chief of whom was distinguished by the name of *jinistrus*. He was perpetual, and they paid him great respect and veneration.

BOURIGNON (Antonicetta), a famous enthusiastic preacher and pretended prophetess, was born at Lisle in 1616. At her birth she was so deformed, that it was debated some days in the family whether it was not proper to stifle her as a monster: but her deformity diminishing, she was spared; and afterwards obtained such a degree of beauty, that she had her admirers. From her childhood to her old age she had an extraordinary turn of mind. She set up for a reformer, and published a great number of books filled with very singular no-

tions;

Bourguignons
||
Bourignor

Bourignon
Bouts-rimes

tions; the most remarkable of which are intitled *The light of the World*, and *The testimony of Truth*. She was an enemy to reason and common sense, which she maintained ought to give place to the illumination of divine faith; and asserted, that whenever any one was born again by embracing her doctrine, she felt the pains and throes of a woman in labour. Of her pretended visions and revelations we shall give one instance as a sample. In one of her ecstasies she saw Adam in the same form in which he appeared before his fall, and the manner in which he was capable of procreating other men, since he himself possessed in himself the principles of both sexes*. Nay she pretended it was told her that he had carried this procreating faculty so far as to produce the human nature of Jesus Christ. "The first man (says she), whom Adam brought forth without any concurrent assistance in his glorified state, was chosen by God to be the throne of the Divinity; the organ and instrument by which God would communicate himself externally to men: This is Christ the first born united to human nature, both God and man." Besides these and such like extravagancies, she had other forbidding qualities: her temper was morose and peevish, and she was extremely avaricious and greedy of amassing riches. She dressed like an hermit, and travelled to France, Holland, England, and Scotland. In the last she made a strong party, and some thousand sectarists, known by the name of *Bourignonists*. She died at Faneker in the province of Frise, October 30th, 1630. Her works have been printed in 18 vols octavo.

BOURN, a town of Lincolnshire in England, seated in E. Long. 1. 17. N. Lat. 52. 40. It is a pretty large place, has a good market for corn and provisions, and is noted for the coronation of King Edmund.

BOURNE, or **BURN**, an appellation anciently given to all little brooks or rivulets, and still used in the same sense in Scotland and in the north of England.

BOURO, an island in the East Indian ocean, between the Moluccas and Celebes. It is well cultivated; and is now subject to the Dutch, who have built a fortress here. Some mountains in it are exceeding high, and the sea on one side is uncommonly deep. It produces nutmegs and cloves, as well as cocoa and banana trees; besides many vegetables introduced by the Dutch. It is about 50 miles in circumference. E. Long. 129°. S. Lat. 4. 30.

BOUTANT, or **ARCH-BOUTANT**, in architecture, an arch, or part of an arch, abutting against the reins of a vault to prevent its giving way.

A Pillar BOUTANT, is a large chain or pile of stone, made to support a wall, terrace, or vault.

BOUTE, in the manege. A horse is called *bouté*, when his legs are in a straight line from the knee to the coronet: short-jointed horses are apt to be *boutés*, and on the other hand long-jointed horses are not.

BOUTS-RIMES, a popular term in the French poetry; signifying certain rhymes, disposed in order, and given to a poet together with a subject, to be filled up with verses ending in the same words, and the same order. The invention of the *bouts-rimes* is owing to one Du Lot, a poet, in the year 1649. In fixing the *bouts*, it is usual to choose such as seem the remotest, and have the least connection.

Bouton
B w.

Some good authors fancy that these rhymes are of all others the easiest, that they assist the invention, and furnish the most new thoughts of all others. Sarrafin has a poem on the defeat of the *bouts-rimes*. The academy of Lanternists at Tholouse have contributed towards keeping in countenance the *bouts-rimes*, by proposing each year a set of fourteen, to be filled up on the glories of the grand monarch: the victorious sonnet to be rewarded with a fine medal.—An instance hereof may be given in the following one, filled up by P. Commire.

Tout est grand dans le roi, l'aspect seul de son buste
Rend nos fiens ennemis plus froids que des glaçons.
Et Guillaume n'attend que le temps des moissons,
Pour se voir succomber sous un bras si robuste.
Qu'on ne vous vante plus les miracles d' Angulle;
Louis de bien regner lui seroit des leçons;
Horace en vain s'écale aux dieux dans ses chansons:
Moins que mon heros il étoit sage et julle, &c.

BOUTON, an island in the East Indian ocean, about 12 miles distant from the south-east part of the island of Macassar, or Celebes. The inhabitants are small, but well shaped, and of a dark olive complexion. The principal town is Callafujung, which is about a mile from the sea, on the top of a small hill, and round it a stone wall. The houses are not built upon the ground, but on posts. The religion of the inhabitants is Mahometanism. E. Long. 122. 30. S. Lat. 4. 30.

BOUVILLON, a city of Luxemburg in the Austrian Netherlands, situated in E. Long. 5. c. N. Lat. 49. 55.

BOW (*Arcus*), a weapon of offence made of wood, horn, or other elastic matter, which, after being strongly bent, by means of a string fastened to its two ends, in returning to its natural state throws out an arrow with great force. It is also called the *long-bow*, by way of distinction from the *crois-bow* or *arbalet*.

The bow is the most ancient, and the most universal of all weapons. It has been found to obtain among the most barbarous and remote people, and who had the least communication with the rest of mankind.

The use of the bow and arrow was first abolished in France under Louis XI. in 1487, and in their place was introduced the Swiss arms, that is, the halbard, pike, and broad-sword. The long-bow was formerly in great vogue in England; most of our victories in France were acquired by it; and many laws were made to regulate and encourage its use. The parliament under Henry VIII. complain "of the dilute of the long-bow, heretofore the safe-guard and defence of this kingdom, and the dread and terror of its enemies." 33 Hen. VIII. cap. 6.

The art of using bows is called *archery*, and those practised therein, *archers*, or *bowmen*. See **ARCHERY**.

The strength of a bow may be calculated on this principle, that its spring, i. e. the power whereby it restores itself to its natural position, is always proportionate to the distance or space it is removed therefrom.

The most barbarous nations often excel in the fabric of the particular things which they have the greatest necessity for in the common offices of life. The Laplanders, who support themselves almost entirely by hunting, have an art of making bows, which we, in these improved parts of the world, have never arrived at.

Their

Bow.

Their bow is made of two pieces of tough and strong wood, shaved down to the same size, and flatted on each side; the two flat sides of the pieces are brought closely and evenly together, and then joined by means of a glue made of the skins of pearch, which they have in great plenty, and of which they make a glue superior in strength to any which we have. The two pieces, when once united in this manner, will never separate, and the bow is of much more force to expel the arrow, than it could possibly have been under the same dimensions if made of only one piece.

Among the ancients, the bow-string, called *πριχαστις*, was made of horses hair, and hence also called *πριχαστις*; though Homer's bow strings are frequently made of hides cut into small thongs; whence *πριχαστις*. The uppermost part of the bow, to which the string was fastened, was called *κρηνη*, being commonly made of gold, and the last thing towards finishing the bow. The Grecian bows were frequently beautified with gold or silver; whence we have mention of *auri arcus*; and Apollo is called *ἄργυροτοξος*. But the matter of which they were ordinarily composed, seems to have been wood; though they were anciently, Scythian-like, made of horn, as appears from that of Pandarus in Homer, *Iliad. 3. v. 105.*

The invention of the bow is usually ascribed to Apollo, and was communicated to the primitive inhabitants of Crete, who are said to have been the first of mortals who understood the use of bows and arrows. And hence, even in latter ages, the Cretan bows were famous, and preferred by the Greeks to all others. Some, however, rather choose to honour Perfes, the son of Perseus, with the invention of the bow; while others ascribe it to Scythes, son of Jupiter, and progenitor to the Scythians, who were excellent at this art, and by many reputed the first masters of it. From them it was derived to the Grecians, some of whose ancient nobility were instructed by the Scythians in the use of the bow, which in those days passed for a most princely education. It was first introduced into the Roman army in the second Punic war.

The Indians still retain the bow. In the repository of the Royal Society we see a West Indian bow two yards long.

The Scythian bow was famous for its incurvation, which distinguished it from the bows of Greece and other nations; being so great as to form an half-moon or semicircle: whence the shepherd in Athenæus, being to describe the letters in Theseus's name, and expressing each of them by some opposite resemblance, compares the third to the Scythian bow; meaning not the more modern character *z*, but the ancient *z*, which is semicircular, and bears the third place in *ΘΗΕΥΖ*.

Cross-Bow, is also called *arbalist* or *arbalist*; which word is derived from *arbalista*, i. e. *arcubalista*, "a bow with a sling." The arbalist consists of a steel-bow, set in a shaft of wood, furnished with a sling and a trigger; and is bent with a piece of iron fitted for that purpose. It serves to throw bullets, large arrows, darts, &c. The ancients had large machines for throwing many arrows at once, called *arbalists* or *ballistæ*.

Bow, is also an instrument used at sea, for taking the sun's altitude; consisting of a large arch of 90° gra-

uated, a skank or staff, a side vane, a sight vane, and an horizon vane. It is now out of use.

Bow, among builders, a beam of wood or brass, with three long screws that direct a lathe of wood or steel to any arch; chiefly used in drawing draughts of ships and projections of the sphere, or wherever it is requisite to draw large arches.

Bow, in music, a small machine, which, being drawn over the strings of a musical instrument, makes it resound. It is composed of a small stick, to which are fastened 80 or 100 horse-hairs, and a screw which serves to give these hairs a proper tension. In order that the bow may touch the strings briskly, it is usual to rub the hairs with rosin. The ancients do not appear to have been acquainted with bows of hair: in lieu hereof they touched their instruments with a plectrum; over which our bows have great advantage, for giving long and short sounds, and other modifications which a plectrum cannot produce.

Bow, among artificers, an instrument so called from its figure; in use among gunsmiths, locksmiths, watch-makers, &c. for making a drill go. Among turners it is the name of that pole fixed to the ceiling, to which they fasten the cord that whirls round the piece to be turned.

Bow, a town of Devonshire in Wales, situated in W. Long. 4. 0. N. Lat. 50. 45.

Bow's of a Saddle, are two pieces of wood laid archwise to receive the upper part of a horse's back, to give the saddle its due form, and to keep it tight.

The fore-bow which sustains the pommel, is composed of the withers, the breasts, the points or toes, and the cording.

The hind-bow bears the troussequin or quilted roll. The bows are covered with sinews, that is with bull's pizzles beaten, and so run all over the bows to make them stronger. Then they are strengthened with bands of iron to keep them tight; and on the lower side are nailed on the saddle straps, with which they make fast the girths.

Bow, Epaule, in ship-building, the rounding part of a ship's side forward, beginning at the place where the planks arch inwards; and terminated where they close, at the stem or prow. It is proved by a variety of experiments, that a ship with a narrow bow is much better calculated for sailing swiftly, than one with a broad bow; but is not so well fitted for a high sea, into which she always pitches or plunges her fore-part very deep, for want of sufficient breadth to repel the volume of water which she so easily divides in her fall. The former of these is called by seamen a *lean*, and the other a *bluff* bow. "The bow which meets with the least resistance in a direct course, not only meets with the least resistance in oblique courses, but also has the additional property of diving the least to leeward; which is a double advantage gained by forming the bow so as to give it that figure which will be least resisted in moving through any medium*."

On the Bow, in navigation, an arch of the horizon comprehended between some distant object and that point of the compass which is right a-head, or to which the ship's stem is directed. This phrase is equally applicable when the object is beheld from the ship, or discovered by trigonometrical calculation: As, we saw a fleet

* Bouguer's
Traité de
Navire.

Bow
||
Bower.

fleet at day-break bearing three points on the starboard-bow: that is, three points from that part of the horizon which is right a-head, towards the right-hand. See the article BEARING.

Bow-dye, a kind of scarlet red, superior to madder; but inferior to the true scarlet grain for fixedness and duration. It was brought into England, and first practised at the village of Bow, near London, by Kephler, a Dutchman, in the year 1643.

Bow-grace, in the sea-language, a frame or composition of old ropes or junks of cables, used to be laid out at the bows, stems, and sides of ships, to preserve them from great flakes of ice, chiefly when they sail in high north or south latitudes.

Bow-net, or *Bow-wheel*, an engine for catching fish, chiefly lobsters and craw-fish, made of two round wicker baskets, pointed at the end, one of which is thrust into the other; at the mouth is a little rim, four or five inches broad, somewhat bent inwards. It is also used for catching sparrows.

Bow-Legged, or *Bandy legged*. Some children are bow-legged from their birth; others become so from setting them on their feet too early. The tibia of some is crooked; the knees of others are distorted; from a fault in the ankle, the feet of some are turned inwards. These are called *viri*; and in others, who are called *vulgi*, they are turned outwards. The best method of preventing these disorders in weakly children is to exercise them duly, but not violently, by dancing or tossing them about in one's arms; and not setting them much upon their feet, at least not without properly supporting them: if the disorder attends at the birth, or increases after it is begun, apply emollients, then apply boots of strong leather, wood, &c. so as gradually to dispose the crooked legs to a proper form; or other instruments may be used instead of boots, which, when not too costly, are usually to be preferred. Slighter instances of these disorders yield to careful nursing, without instruments.

Bow-Line, or *Bowling*, a rope fastened near the middle of the leech, or perpendicular edge of the square sails, by three or four subordinate parts called *bridles*. It is only used when the wind is so unfavourable that the sails must be all braced sideways, or close-hauled to the wind: in this situation the bow-lines are employed to keep the weather or windward edges of the principal sails tight, forward, and steady, without which they would always be shivering, and rendered incapable of service. To *check* the bow-line is to slacken it, when the wind becomes large.

Bow-Pieces, are the pieces of ordnance at the bow of a ship.

Bow-Pou. See *Rain-Bow*.

Bow-Beater, an inferior officer of the forest, who is sworn to make inquisition of all trespasses against vert or venison, and to attach offenders.

BOWELS, in anatomy, the same with intestines. See ANATOMY, n^o 93.

BOWER, in gardening, a place under covert of trees, differing only from an arbour, as being round or square, and made with a kind of dome or ceiling at top; whereas the arbour is always built long and arched.

BOWER, in the sea-language, the name of an anchor

carried at the bow of a ship. There are generally two bowers, called *first* and *second*, *great* and *little*, or *left* and *small* bower. See ANCHOR.

BOWESS, or BOWET, in falconry; a young hawk, when she draws any thing out of her nest, and covets to clamber on the boughs.

BOWL, denotes either a ball of wood, for the use of bowling; or a vessel of capacity, wherein to hold liquors.

BOWLDER-STONES, small stones, of a roundish figure, and no determinate size, found on the sea-shore, and on banks or rather channels of rivers.

BOWLING, the art of playing at bowls.—This game is practised either in open places, as bars and bowling-greens, or in close bowling-alleys.

The skill of bowling depends much on a knowledge of the ground, and the right choice of a bowl suitable to it: for close alleys, the flat bowl; for green swards plain and level, the bowl as round as a ball is preferred.

The terms used in bowling are, to *bowl wide*, which is when the bias does not hold, or is not strong enough; *narrow*, when it is too strong, or holds too much; *finely bowled*, is when the ground is well chosen, and the bowl passes near the block, even though it goes much beyond it; *bowling through*, or a *yard over*, is done in order to move the block; an *over bowl*, that which goes beyond it; a *bowl laid at hand*, is that put down within the gameller's reach, to be in the way of the next bowler, and hinder his having the advantage of the best ground; *bowling at length*, neither bowling through nor short; a *dead length*, a full or exact one; *throwing or pinging*, is discharging a bowl with a strength purposely too great for a length, in order to carry off either the block or some near bowl; *bowl-room*, or *missing-wood*, is when a bowl has free passage, without striking on any other; *get up*, is when a bowl being narrow, is wanted to be wider; *bowl left at the block*, that nearest the block; *drawing a cast or bowl*, is to win it by bowling nearer, without striking either the bowl or block; a bowl is said to *rub*, when it meets with some obstacle in the ground, which retards its motion, and weakens its force; *it is gone*, when far beyond the block. *Block* signifies a little bowl laid for a mark, also called a *jack*. *Mark*, is a proper bowling distance, not under for many yards; and being at least a yard and a half from the edge of the green. *Ground*, a bag or handkerchief laid down to mark where a bowl is to go. *Lead*, the advantage of throwing the block, and bowling first. *Cast*, is one bowl at an end. *End*, a hit, or when all the bowls are out. *The game*, or *up*, is five casts or ball bowls.

Bowling-Green, in gardening, a kind of parterre in a grove, laid with fine turf, requiring to be frequently mowed, laid out in compartments of divers figures, with dwarf trees and other decorations. Bowling-greens are of English origin, but have been adopted by the French and Italians, who have them only for ornament; being unacquainted with or not fancying the exercise, on account of which they were first made in England.

Bowling-Bridles, are the ropes by which the bow-line is fastened to the leech of the sail.

BOWSE, in the sea-language, signifies as much as

B wess
||
Bowte.

Bowprit,
B
owyer.

to hale or pull. Thus *hauling upon a tack*, is hauling upon a tack. *Bowse away*, that is, Pull away all together.

BOWSPRIT, or **BOLTSRIT**, a kind of mast, resting slopewise on the head of the main stern, and having its lower end fastened to the partners of the fore-mast, and farther supported by the fore-stay. It carries the fore-sail, sprit-top-sail, and jack-staff; and its length is usually the same with that of the fore-mast.

BOWYER (William), the most learned printer of his age, was born at White Friars in London, December 17, 1699. His father, whose name also was William, had been eminent in the same profession; and his maternal grandfather (Icabod Dawks) was employed in printing the celebrated Polyglott bible of bishop Walton. At a proper age, he was placed for grammatical education under the care of Mr Ambrose Bonwicke, a nonjuring clergyman of known piety and learning, who then lived at Headly, near Leatherhead in Surrey. Here Mr Bowyer made great advances in literature, and a firm attachment commenced betwixt him and his master. On the 30th of January 1713, the whole property of the elder Mr Bowyer was destroyed by fire; on which occasion Mr Bonwicke generously undertook the education of his pupil for one year. In 1716, young Mr Bowyer was admitted a sizar at St John's college, Cambridge, where Dr Robert Jenkin was at that time master. He continued at the college of Cambridge under the tuition of the reverend Dr John Newcome till June 1722, during which period he probably took his degree of Bachelor of Arts; and it appears that he was desirous of obtaining a fellowship, though it is not certain that he ever stood a candidate for that honour. Soon after this he had an opportunity of repaying the kindness which Mr Bonwicke had shown him, by officiating some time after his death in the capacity of a schoolmaster for the benefit of his family.

Mr Bowyer now entered into the printing-business along with his father. One of the first books which received the benefit of his correction was the complete edition of Selden in three volumes folio by Dr David Wilkins. This edition was begun in 1722, and finished in 1725; and Mr Bowyer's great attention to it appeared in his drawing up an epitome of Selden's *Synodus*, as he read the proof-sheets. In 1727, he drew up an excellent sketch of William Baxter's Glossary of the Roman Antiquities. This was called "A view of a book intitled *Reliquie Baxterianæ*. In a letter to a friend." A single sheet 8vo. By this first public proof of Mr Bowyer's abilities, Dr Wotton and Mr Clarke were highly pleased; but as it was never published, and very few copies printed, it is very seldom found with the glossary. In 1727 Mr Bowyer lost his mother; on which occasion he received a letter of consolation from Mr Chishul the learned editor of the *Antiquitates Astol.æ*. In October 1728 he married Miss Ann Proden, his mother's niece, a very accomplished lady, by whom he had two sons, William and Thomas; the former of whom died an infant, and the latter survived his father. In 1729 Mr Bowyer published a curious treatise, intitled, "A Pattern for young Students in the University; set forth in the Life of Ambrose Bonwicke, some time scholar of St John's College, Cambridge;" but though this treatise

Bowyer.

was generally ascribed to Mr Bowyer, it was in reality the production of Mr Ambrose Bonwicke the elder. About this time it appears, that Mr Bowyer had written a pamphlet against the Separatists, though neither the title nor the occasion of it are now remembered. The same year, through the friendship of the Right Hon. Arthur Onslow, he was appointed printer of the Votes of the House of Commons; which office he held, under three successive speakers, for near fifty years. In 1731 Mr Bowyer published, and, it is believed, translated Voltaire's Life of Charles XII. This year also his wife died; on which occasion his friends Mr Clarke and Mr Chishul wrote him very affectionate and Christian letters. He remained a widower till 1747, when he married a very benevolent and worthy woman, Mrs Elizabeth Bill, by whom he had no children. In 1733 he published a piece in two sheets 4to, intitled, "The Beau and the Academic;" being a translation from a Latin poem recited that year at the Sheldonian theatre; and in 1736 he was admitted into the Society of Antiquarians, where he became an active and useful member. In 1737 Mr Bowyer lost his father; and on this occasion Mr Clarke again addressed to him a letter of consolation. In 1742 our author published a translation of Trapp's Latin Lectures on Poetry, in which he was assisted by Mr Clarke, though the latter had a contemptible opinion of the performance.

In 1749, Mr Bowyer, along with Dr Burton, was virulently attacked by Dr King in a piece intitled *Ægium sive inferiens Jacobi Eatonensis sive Gigantis*: or, "The praises of Jack Eaton, commonly called *Jack the Giant*."—This abuse was probably occasioned by Mr Bowyer's having hinted in conversation some doubts concerning the Doctor's skill in Latin. Our author drew up some strictures in his own defence, which he intended to insert at the conclusion of a preface to Montefquieu's Reflections; but by Dr Clarke's advice they were omitted. In 1750, a prefatory critical dissertation and some notes were annexed by our author to Kuster's Treatise *De usu verborum medicorum*; a new edition of which, with farther improvements, appeared in 1773. He wrote likewise about the same time a Latin preface to Leedes's *Vetores præta citati*, &c.—Being soon after employed to print an edition of Col. Bladen's translation of Cæsar's Commentaries, that work received considerable improvements from Mr Bowyer's hands, with the addition of such notes in it as are signed TYPOGR. In the subsequent editions of this work, though printed by another person during our author's lifetime, the same signature, though contrary to decorum, and even to justice, was still retained. In 1751, he wrote a long preface to Montefquieu's "Reflections on the rise and fall of the Roman Empire;" translated the dialogue between Sylla and Socrates; made several corrections to the work from the Baron's "Spirit of Laws;" and improved it with his own notes. A new edition, with many new notes, was printed in 1759. In 1751 he also published the first translation that ever was made of Rousseau's paradoxical oration, which gained the prize at the academy of Dijon in 1750; and which first announced that singular genius to the attention and admiration of Europe. On the publication of the third edition of Lord Orrery's "Remarks on the Life and Writings of Dr Swift," in

1752, Mr Bowyer wrote and printed, but never published, "Two Letters from Dr Bentley in the Shades below, to Lord Orrery in a Land of thick darknefs." The notes signed B, in the ninth quarto volume of Swift's works, are extracted from these Letters. In 1753, he endeavoured to allay the ferment occasioned by the Jew bill; with which view he published, in quarto, "Remarks on the speech made in common-council, on the bill for permitting persons professing the Jewish religion to be naturalized, so far as prophecies are supposed to be affected by it." This little tract was written with spirit, and well received by those who were superior to narrow prejudices. Its design was to show, that whatever political reasons might be alleged against the bill, Christianity was in no danger of being prejudiced by the intended protection promised to the Jews. The same year some of Mr Bowyer's notes were annexed to Bishop Claton's translation of "A Journal from grand Cairo to mount Sinai and back again."—In 1754, Mr Bowyer, with a view of lessening his fatigue, entered into partnership with a relation; but some disagreement arising, the connexion was dissolved in three years. On the death of Mr Richardson in 1761, Mr Bowyer succeeded him as printer to the Royal Society, through the favour of the late Earl of Macclesfield; and, under the friendship of five successive presidents, enjoyed that office till his death.

In 1763, Mr Bowyer published an excellent edition of the Greek Testament, in two vols 12mo. It appeared under the following title: *Novum Testamentum Græcum; ad fidem Græcorum solum Codicum MSS. nunc primum impressum, adscriptante Joanne Jacobo Wettsteinio, juxta Seditiones Jo. Alberti Bengelii divisum; et nova interpretatione sæpius illustratum. Accessere in altero volumine, Emendationes conjecturales virorum doctorum undecunque collectæ.* This sold with great rapidity: the Conjectural Emendations were well received by the learned, and are thought to be a valuable work. The president and fellows of Harvard college in Cambridge expressed their approbation of this edition in very high terms. In a letter to Mr Bowyer, written in the year 1767, "This work (say they), though small in bulk, we esteem as a rich treasure of sacred learning, and of more value than many large volumes of the commentators." A second edition of the Conjectures on the New Testament, with very considerable enlargements, was separately published, in one vol. 8vo, in 1772. Bishop Warburton having censured a passage in the former edition, Mr Bowyer sent him a copy of this book, with a conciliatory letter. Dr Warburton's Divine Legation had received very considerable advantage from Mr Bowyer's corrections; and this even in an edition which was necessarily given to another press. In 1761 he was employed to print his Lordship's Doctrine of Grace. A second edition being soon wanted, and Mr Bowyer not having been intrusted with the care of it, he prepared a series of letters to the bishop in his own defence; of which, together with a few he had formerly received from that great writer, he afterwards printed *twelve copies*, of which *ten* have since been destroyed. However, there is the best authority for asserting, that notwithstanding any little altercations which happened, Dr Warburton always retained a sincere regard for our au-

thor. In 1765, at the request of Thomas Hollis, Esq; Mr Bowyer wrote a short Latin preface to Dr Wallis's *Grammatica Lingue Anglicane*. He wrote also a larger English preface for the same work, which, however, still remains unprinted. In 1766 he entered into partnership with Mr Nichols, who had been trained by him to the profession, and had for several years assisted him in the management of his business. The same year, Mr Bowyer wrote an excellent Latin preface to *Joannis Harduini, Jesuitæ, ad Censuram Scriptorum veterum Prolegomena. Juxta autographum*. In 1767 he was appointed to print the Journals of the House of Lords and the Rolls of Parliament. This year he printed Mr Carke's excellent and learned work on "The Connection of the Roman, Saxon, and English Coins;" and wrote some notes upon it, which are interspersed throughout the volume with those of the author. Part of the Dissertation on the Roman sesterce was likewise Mr Bowyer's production; and the index, which is an uncommonly good one, was drawn up by him entirely.

In January 1771 Mr Bowyer lost his second wife, and again received a letter of consolation from his old friend Mr Clarke, who had sent him one almost forty years before on a similar occasion. In the Philosophical Transactions for this year was printed a very ingenious "Inquiry into the Value of the ancient Greek and Roman Money," by the late Matthew Raper, Esq. But his opinions not coinciding with those of Mr Bowyer, he printed a small pamphlet, intitled, "Remarks, occasioned by a late Dissertation on the Greek and Roman money." In 1773 three little tracts were published by him, under the title of "Select Discourses." 1. Of the correspondence of the Hebrew months with the Julian, from the Latin of Professor Michaelis. 2. Of the Sabbatical years, from the same. 3. Of the years of jubilee, from an anonymous writer in Masson's *Histoire Critique de la Republique des Lettres*." In 1774 he corrected a new edition of Schrevelius's Greek Lexicon; to which he has added a number of words, distinguished by an asterisk, which he himself had collected in the course of his studies. Considerable additions, still in manuscript, were made by him to the lexicons of Hederic and Buxtorf, the Latin ones of Faber and Littleton, and the English Dictionary of Bailey; and he left behind him many other proofs of his critical skill in the learned languages. In 1774 was published, "The Origin of printing, in two Essays." 1. The substance of Dr Middleton's Dissertation on the Origin of Printing in England. 2. Mr Meerman's Account of the Invention of the Art at Herlein, and its progress to Mentz, with occasional Remarks, and an Appendix." The original idea of this valuable tract was Mr Bowyer's, but it was completed by Mr Nichols.

Although our author, during the last ten years of his life, had been afflicted with the palsy and stone, he not only preserved a remarkable cheerfulness of temper, but was enabled to support the labour of almost incessant reading; and he regularly corrected the learned works, especially the Greek books, which came from his press. This he continued to do till within a few weeks of his death, which happened in November 1777, when he had nearly completed his 78th year.

Bowyers
||
Boxing.

For more than half a century Mr Bowyer was unrivalled as a learned printer; and many of the most marvellous productions of this kingdom have come from his press. To his literary and professional abilities he added an excellent moral character; and he was particularly distinguished by his inflexible probity, and an uncommon alacrity in relieving the necessitous.

BOWYERS, artificers whose business is to make bows; in which sense, bowyers stand distinguished from fletchers, who made arrows.

The bowyers company in London was incorporated in 1620: and consists of a master, two wardens, twelve assistants, and 50 on the livery. See ARCHERY.

BOX, in its most common acceptation, denotes a small chest or coffer for holding things.

Dice-Box, a narrow deep cornet, channelled within, wherein the dice are shaken and thrown. This answers to what the Romans called *fritillus*; whence, *crepitorum fritilli*; and, in Seneca, *resonante fritillo*. The same author uses also *concutere fritillum*, figuratively, for playing.— Besides the fritillus, the Romans, for greater security, had another kind of dice-box called *pygus*, πύγος, and sometimes *turricula*. It was placed immoveable in the middle of the table, being perforated or open at both ends, and likewise channelled within; over the top was placed a kind of funnel, into which the dice were cast out upon the fritillus; whence descending, they fell through the bottom on the table; by which all practising on them with the fingers was effectually prevented. For want of some contrivance of this kind, our sharpers have opportunities of playing divers tricks with the box, as palming, topping, slabbing, &c.

Box, is also used for an uncertain quantity or measure: thus a box of quicksilver contains from one to two hundred weight; a box of prunellas only 14 pounds; a box of rings for keys, two gros, &c.

Box-Tree, in botany. See BUXUS.

African-Box. See MYRSINE.

BOXERS, a kind of *athletæ*, who combat or contend for victory with their fists. Boxers amount to the same with what among the Romans were called *pugiles*. The ancient boxers battled with great force and fury, insomuch as to dash out each others teeth, break bones, and often kill each other. The strange disfigurements these boxers underwent were such that they frequently could not be known, and rendered them the subject of many railleries. In the Greek anthology there are four epigrams of the poet Lucilius, and one of Lucian, wherein their disfigurements are pleasantly enough exposed. See BOXING.

BOXHORNIIUS (Marc Zucrius), a learned critic born at Bergen-op-Zoom in 1612, was professor of eloquence at Leyden, and at length of politics and history in the room of Heinsius. He published, 1. *Theatrum artem Hollandiæ*. 2. *Scriptores historiæ Augustæ, cum notis*. 3. *Poetæ satyrici minores, cum comment.* 4. Notes on Justin, Tacitus; and a great number of other works. He died in 1653, aged 41.

BOXING, the exercise of fighting with the fists, either naked or with a stone or leaden ball grasped in them: in which sense, boxing coincides with the *pugilatus* of the Romans, and what on our amphitheatres is sometimes called trial of manhood. When the champions had *σφαίρα*, or balls, whether of lead or

stone, it was properly denominated *σφαίρομαχία*. The ancient boxing differed from the *pugna æstuum*, in which the combatants had leathern thongs on their hands, and balls to offend their antagonists; though this distinction is frequently overlooked, and fighting with the *æstus* ranked as a part of the business of *pugiles*. We may distinguish three species of boxing; *viz.* where both the head and hands were naked; where the hands were armed and the head naked; and where the head was covered with a kind of cap called *amphotides*, and the hands also furnished with the *æstus*.

Boxing is an ancient exercise, having been in use in the heroic ages. Those who prepared themselves for it, used all the means that could be contrived to render themselves fat and fleshy, that they might be better able to endure blows: whence corpulent men or women were usually called *pugiles*, according to Terence: *Siqua est habitior paulo, pugilam esse aiunt*.

In modern times this art has been in a manner appropriated by the English. About half a century ago it formed as regular an exhibition as we now see at any of the places of public amusement, the theatres alone excepted. It was encouraged by the first ranks of the nobility, patronised by the first subject in the realm, and tolerated by the magistrates. Before the establishment of Broughton's amphitheatre, a Booth was erected at Tottenham Court, in which the proprietor, Mr George Taylor, invited the professors of the art to display their skill, and the public to be present at its exhibition. The bruisers then had the reward due to their prowess, in a division of the entrance-money, which sometimes was 100, or 150*l*. The general mode of sharing was for two thirds to go to the winning champion, while the remaining third was the right of the loser; though sometimes by an express agreement of the parties, the conqueror and the vanquished shared alike. The nobility and gentry having complained of the inconveniences sustained at Taylor's Booth, prevailed on Mr Broughton, who was then rising into note as the first braiser in London, to build a place better adapted for such exhibitions. This was accordingly done in 1742, principally by subscription, behind Oxford-road. The building was called Broughton's New Amphitheatre; and, besides the stage for the combatants, had seats corresponding to the boxes, pit, and galleries, much in the same manner with those at Atley's. After a course of years, however, these exhibitions became gradually less patronised and frequented, owing probably to the refinement of our manners. Lately, indeed, they seemed to be revived, and for some time considerably engaged the attention of the public; but a fatal issue which attended one of them, brought the practice again into disrepute. One of the combatants was killed on the spot. His royal highness the Prince of Wales was present, and declared that he would have some settlement made on the nearest relation of the deceased, but that on account of the dreadful example he had then witnessed he would never more either see or patronise another stage-fight.

BOXING, among sailors, is used to denote the rehearsing the several points of the compass in their proper order.

BOXING is also used for the tapping of a tree to make

Boxing.

make it yield its juice. The boxing of maple is performed by making an hole with an ax or chisel into the side of the tree about a foot from the ground; out of it flows a liquor of which sugar is made.

BOXTEHUDE, a town of Germany, in the circle of Lower Saxony, subject to the Danes. It is seated on the rivulet Elße, which falls into the Elbe, in E. Long. 9. 35. N. Lat. 53. 40.

BOXTEL, a town in Dutch Brabant, with sluices, seated on the river Bommel. E. Long. 5. 15. N. Lat. 51. 30.

BOYAR, a term used for a grandee of Russia and Transylvania. Beeman says, that the boyars are the upper nobility; and adds, that the Czar of Muscovy, in his diplomas, names the boyars before the waywodes. See **WAYWODE**.

BOYAU, in fortification, a ditch covered with a parapet, which serves as a communication between two trenches. It runs parallel to the works of the body of the place; and serves as a line of contravallation, not only to hinder the sallies of the besieged, but also to secure the manners. But when it is a particular cut that runs from the trenches to cover some spot of ground, it is drawn so as not to be entailed or scoured by the snot from the town.

BOYD (Mark Alexander), an extraordinary genius, was son of Robert Boyd, who was eldest son of Adam Boyd of Pinkhill, brother to Lord Boyd. He was born in Galloway on the 13th of January 1562, and came into the world with teeth. He learned the rudiments of the Latin and Greek languages at Glasgow under two grammarians; but was of so high and untractable a spirit, that they despaired of ever making him a scholar. Having quarrelled with his masters, he beat them both, burnt his books, and forswore learning. While he was yet a youth, he followed the court, and did his utmost to push his interest there; but the seivour of his temper soon precipitated him into quairles, from which he came off with honour and safety, though frequently at the hazard of his life. He, with the approbation of his friends, went to serve in the French army, and carried his little patrimony with him, which he soon dissipated at play. He was shortly after roused by that emulation which is natural to great minds, and applied himself to letters with unremitting ardour, till he became one of the most consummate scholars of his age. He is said to have translated Cæsar's Commentaries into Greek in the style of Herodotus, and to have written many Latin poems which were little inferior to the first productions of the Augustan age. He also left several manuscripts on philological, political, and historical subjects, in Latin and French, which languages were as familiar to him as his native tongue. He could with facility dictate to three amanuenses at the same time, in different languages, and on different subjects. He was also one of the best Scottish poets of the age. To all this we must add, that his personal beauty and accomplishments were equal to his mental superiority. He died at Pinkhill in Scotland, in 1601. The following works, which are all that have been printed, were published in *Deliciae Poetarum Scotorum*; Amstel. 1637, 12mo. 1. *Epigrammata*, lib. ii. 2. *Heroidum Epistole* XIV. lib. i. 3. *Hymni* XIV.

BOYER (Abel), a well-known glossographer and historiographer, born at Cañres in France, in 1664.

Upon the revocation of the edict of Nantz, he went first to Geneva, then to Franeker, where he finished his studies; and came finally to England, where he applied himself so closely to the study of the English language, and made so great a proficiency therein, that he became an author of considerable note in it, being employed in the writing of several periodical and political works. He was for many years concerned in, and had the principal management of, a newspaper called the *Post-boy*. He likewise published a monthly work, intitled, the *Political state of Great Britain*. He wrote a life of queen Anne in folio, which is esteemed a very good chronicle of that period of the English history. But what has rendered him the most known, and established his name to the latest posterity, are the excellent Dictionary and Grammar of the French language, which he compiled, and which have been and still are reckoned the best in their kind. He also wrote, or rather translated from the French of M. de Racine, the tragedy of Iphigenia, which he published under the title of *The Victim*. It was performed with success at the theatre of Drury-lane, and is far from being a bad play. Nor can there perhaps be a stronger instance of the abilities of its author, than success in such an attempt; since writing with any degree of correctness or elegance, even in prose, in a language which we were not born to the speaking of, is an excellence not very frequently attained; but to proceed so far in the perfection of it as to be even sufferable in poetry, and more especially in that of the Drama, in which the diction and manner of expression require a peculiar dignity and force, and in a language so difficult to attain the perfect command of as the English, is what has been very seldom accomplished. He died in 1729.

BOYER, in navigation, a kind of Flemish sloop, or small vessel of burden, having a boltsprit, a castle at each end, and a tall mast; chiefly fit for the navigation of rivers, and in many of its parts resembling a smack.

BOYES, idolatrous priests among the savages of Florida. Every priest attends a particular idol, and the natives address themselves to the priest of that idol to which they intend to pay their devotion. The idol is invoked in hymns, and his usual offering is the smoke of tobacco.

BOYLE (Richard), one of the greatest statesmen of the last century, and generally stiled the *Great earl of Cork*, was the youngest son of Mr Roger Boyle, and was born at Canterbury, on the 3d of October, 1566. He studied at Bennet college, Cambridge; afterwards became a student in the Middle Temple. Having lost his father and mother, and being unable to support himself in the prosecution of his studies, he became clerk to Sir Richard Manhood, one of the chief barons of the exchequer; but finding that by his employment he could not raise his fortune, he went to Ireland in 1588, with fewer pounds in his pocket than he afterwards acquired thousands a-year. He was then about 22, had a graceful person, and many accomplishments, which enabled him to render himself useful to several of the principal persons employed in the government, by drawing up for them memorials, cases, and answers. In 1595, he married Joan the daughter and coheir of William Anley, who had fallen in love with him; and the dying in labour of her first child, who was born dead, in 1599, left him an estate of 500l. a-year in land. In

Boyer
Boyle.

Boyle.

consequence of various services, and the great abilities he displayed, he gradually rose to the highest offices, and even to the dignity of the peerage of Ireland; to which he was raised by king James I. on the 29th of September 1616, by the style and title of *baron of Youghall*, in the county of Cork: four years after, he was created viscount Dungarvan and earl of Cork; and in 1631 was made lord treasurer of Ireland, an honour that was made hereditary to his family. He particularly distinguished himself by the noble stand he made, when the fatal rebellion broke out in that kingdom, in the reign of Charles I.; and in his old age acted with as much bravery and military skill, as if he had been trained from his infancy to the profession of arms. He turned the castle of Lismore, his capital seat, into a fortress capable of demanding respect from the Irish. He immediately armed and disciplined his servants and Protestant tenants; and by their assistance, and a small army raised and maintained at his own expence, which he put under the command of his four sons, defended the province of Munster, and in the space of a year took several strong castles, and killed upwards of 3000 of the enemy: during which time he paid his forces regularly; and when all his money was gone, like a true patriot, converted his plate into coin. This great man died on the 15th of September, 1634.

BOYLE (Richard), earl of Burlington and Cork, son to the former, was a nobleman of unblemished loyalty in rebellious times, and of untainted integrity in times of the greatest corruption. He was born at Youghall, October 20th, 1612, while his father was in the beginning of his prosperity, and only Sir Richard Boyle. He distinguished himself by his loyalty to king Charles I. He not only commanded troops, but raised and for a long time paid them, and continued to wait upon the king as long as any one place held out for him in England, and then was forced to compound for his estate. He contributed all in his power to the Restoration; on which king Charles II. raised him to the dignity of earl of Burlington, or Brighthelmton, in the county of York, in the year 1663. He died Jan. 15, 1697-8, in the 86th year of his age.

BOYLE (Roger), earl of Orrery, younger brother of the former, and the fifth son of Richard, styled the *Great earl of Cork*, was born April 25, 1621; and by the credit of his father with the lord deputy Faulkland, raised to the dignity and title of *baron Broghill*, when only seven years old. He was educated at the college of Dublin, where he soon distinguished himself as an early and promising genius. He afterwards made the tour of France and Italy; and at his return assisted his father in opposing the rebellious Irish, in which he behaved with all the spirit of a young, and all the discretion of an old, officer. Upon the murder of the king, he retired to Marlton in Somersetshire, and hid himself in the privacy of a close retirement; but being at length ashamed to sit the tame spectator of all the mischief that appeared round him, he resolved to attempt something in favour of the king; and under the pretence of going to the Spa for the recovery of his health, he determined to cross the seas, and apply himself to king Charles II. for a commission to raise what forces he could in Ireland, in order to restore his majesty, and recover his own estate. To this purpose, he prevailed on the earl of Warwick to procure a licence for his

Boyle.

going to the Spa; and having raised a considerable sum of money, came up to London to prosecute his voyage: but he had not been long in town when he received a message from Cromwell, who was then general of the parliament's forces, that he intended to wait upon him. The lord Broghill was surpris'd at this message, having never had the least acquaintance with Cromwell; and desired the gentleman to let the general know, that he would wait upon his excellency. But while he was waiting the return of the messenger, Cromwell entered the room; and after mutual civilities had passed between them, told him in few words, that the committee of state were apprised of his design of going over and applying to Charles Stuart for a commission to raise forces in Ireland; and that they were determined to make an example of him, if he himself had not diverted them from that resolution. The lord Broghill interrupted him, by assuring him that the intelligence which the committee had received was false, and that he neither was in a capacity nor had any inclination to raise disturbances in Ireland: but Cromwell, instead of making any reply, drew some papers out of his pocket, which were the copies of several letters which the lord Broghill had sent to those persons in whom he most confided, and put them into his hands. The lord Broghill, upon the perusal of these papers, finding it to no purpose to dissemble any longer, asked his excellency's pardon for what he had said, returned him his humble thanks for his protection against the committee, and intreated his direction how to behave in such a delicate conjuncture. Cromwell told him, that though till this time he had been a stranger to his person, he was not so to his merit and character: he had heard how gallantly his lordship had behaved in the Irish wars; and therefore, since he was named *lord lieutenant of Ireland*, and the reducing that kingdom was now become his province, he had obtained leave of the committee to offer his lordship the command of a general officer, if he would serve in that war; and he should have no oaths or engagements imposed upon him, nor be obliged to draw his sword against any but the Irish rebels.

The lord Broghill was infinitely surpris'd at so generous and unexpected an offer. He saw himself at liberty, by all the rules of honour, to serve against the Irish, whose rebellion and barbarities were equally detested by the royal party and the parliament. He desired, however, some time to consider of what had been proposed to him. But Cromwell briskly told him, that he must come to some resolution that very instant: that he himself was returning to the committee, who were still sitting; and if his lordship rejected their offer, they had determined to send him to the tower. Upon this, the lord Broghill, finding that his liberty and life were in the utmost danger, gave his word and honour that he would faithfully serve him against the Irish rebels: on which Cromwell once more assured him, that the conditions which he had made with him should be punctually observed; and then ordered him to repair to Bristol, adding, that he himself would soon follow him into Ireland. Lord Broghill, therefore, having settled the business of his command, went over into that country; where, by his conduct and intrepidity, he performed many important services, and fully justified the opinion Cromwell had conceived of him.

him. By his own interest he now raised a gallant troop of horse, consisting chiefly of gentlemen attached to him by personal friendship; which corps was soon increased to a complete regiment of 1500 men. These he led into the field against the Irish rebels; and was speedily joined by Cromwell, who placed the highest confidence in his new ally, and found him of the greatest consequence to the interest of the commonwealth.

Among other considerable exploits performed by lord Broghill, the following deserves to be particularly mentioned. Whilst Cromwell laid siege to Clonwell, Broghill being detached to disperse a body of 5000 men who had assembled to relieve the place, he, with 2000 horse and dragoons, came on with the enemy at Naercoombs on the 10th of May 1650; and, without waiting for the arrival of his foot, immediately attacked and routed them, making their general prisoner. Then proceeding to the castle of Carrigdroghid, he sent a summons to the garrison to surrender before the arrival of his battering cannon, otherwise they were to expect no quarter. His own army was surpris'd at this summons, as knowing he had not one piece of heavy cannon; but Broghill had ordered the trunks of several large trees to be drawn at a distance by his baggage horses; which the besieged perceiving, and judging from the showings of the motion that the guns must be of a vast bore, immediately capitulated. He afterwards relieved Cromwell himself at Clonwell, where that great commander happened to be dangerously situated, that he confessed, nothing but the reasonable relief afforded him by lord Broghill could have saved him from destruction. When Ireton lay down before Limerick, he gave Broghill 600 foot and 400 horse, with orders to prevent lord Muskerry's joining the pope's nuncio, who had got together a body of 8000 men, and was determined to attempt the relief of Limerick. Muskerry was at the head of 1000 horse and dragoons, and about 2000 foot: notwithstanding which, lord Broghill fell resolutely upon him. The Irish, having the advantage of the ground and numbers, would have conquer'd, but for a stratagem of lord Broghill. In the heat of the action he desired those about him to repeat what he said; and then cried out as loud as he could, "They run, they run." The first line of the Irish looked round to see if their rear broke; and the rear seeing the faces of their friends, and hearing the shouts of the enemy, imagin'd that the first line was routed, and fled. The taking of Limerick, which put an end to the war in Ireland, was the consequence of this defeat.

When Cromwell became protector, he sent for lord Broghill, merely to take his advice occasionally. And we are told, that, not long after his coming to England, he formed a project for engaging Cromwell to restore the old constitution. The basis of the scheme was to be a match between the king (Charles II.) and the protector's daughter. As his lordship maintained a secret correspondence with the exiled monarch and his friends, it was plain to him that he was beforehand pretty sure that Charles was not averse to the scheme, or he would not have ventured to have propos'd it seriously to Cromwell; who at first seem'd to think it not unfeasible. He soon chang'd his mind, however, and told Broghill that he thought his project impracticable: "For (said he) Charles can never forgive me the death

of his father." In fine, the business came to nothing, although his lordship had engag'd Cromwell's wife and daughter in the scheme; but he never durst let the protector know that he had previously treated with Charles about it.

On the death of the protector, lord Broghill continued attached to his son Richard, till, when he saw that the honesty and good-nature of that worthy man would infallibly render him a prey to his many enemies, he did not think it advisable to mix with a man that he could not save. The dark clouds of misery seem'd now to be hovering over the British island. Lord Broghill saw the storm gathering, and he deem'd it prudent to retire to his command in Ireland, where he shortly after had the satisfaction of seeing things take a turn extremely favourable to the design he had long been well wisher to, viz. that of the king's restoration. In this great event lord Broghill was not a little instrumental; and, in consideration of his eminent services in this respect, Charles created him Earl of Orrery by letters-patent bearing date September 5. 1660. He was soon after made one of the lords justices of Ireland; and his conduct, while at the head of affairs in that kingdom, was such as greatly added to the general esteem in which his character was held before.

His lordship's active and toilsome course of life at length brought upon him some diseases and infirmities which gave him much pain and uneasiness; and a fever which fell into his feet, joined to the gout with which he was often afflicted, abated much of that vigour which he had shown in the early part of his life: but his industry and application were still the same, and bent to the same purposes; as appears from his letters, which show at once a capacity, and an attention to business, which do honour to that age, and may serve as an example to this.

Notwithstanding his infirmities, on the king's desiring to see his lordship in England, he went over in 1657. He found the court in some disorder; where his majesty was on the point of removing the great earl of Clarendon, lord high chancellor; and there was also a great misunderstanding between the two royal brothers. Lord Orrery undertook to reconcile the king with the duke of York; which he effected by prevailing on the latter to ask his majesty's pardon for some steps he had taken in support of the lord chancellor.

On his return to Ireland, he found himself call'd to a new scene of action. The Dutch war was then at its height; and the French, in confederacy with the Irish rebels, were endeavouring to stir up the ashes of rebellion in Ireland. The duke de Beaufort, a'miral of France, had formed a scheme for a descent upon Ireland; but this was rendered abortive by the extraordinary diligence, military skill, and prudent measures, of lord Orrery.

But in midst of all his labours, a dispute arose, founded on a mutual jealousy of each other's interests, betwixt him and his old friend the duke of Ormond, then lord lieutenant; the bad effect of which were soon felt by both disputants, who resort'd to England to defend their respective interests and pretensions, both having been attacked by secret enemies who had gain'd many things to their prejudice. This quarrel, though of a private beginning, became at last of a public nature; and producing first an attempt to frame an impeachment

Boyle.

peachment against the duke of Ormond, occasioned in the end, by way of revenge, an actual impeachment against the earl of Orrery. He defended himself, however, so well against a charge of high crimes, and even of treason itself, that the prosecution came to nothing. He nevertheless lost his public employments; but not the king's favour: he still came frequently to court, and sometimes to council. After this revolution in his affairs, he made several voyages to and from Ireland; was often consulted by his majesty on affairs of the utmost consequence; and on all occasions gave his opinion and advice with the freedom of an honest plain-dealing man and a sincere friend: which the king always found him, and respected him accordingly.

In 1678, being attacked more cruelly than ever by his old enemy the gout, he made his last voyage to England for advice in the medical way. But his disorder was beyond the power of medicine; and having in his last illness given the strongest proofs of Christian patience, manly courage, and rational fortitude, he breathed his last on the 16th of October 1679, in the 59th year of his age. His lordship wrote, 1. A work intitled *The art of war*. 2. *Parthenissa*, a romance, in one volume folio. 3. Several poems. 4. Dramatic pieces, two volumes. 5. State-tracts, in one volume folio, &c. Mr Walpole, speaking of this nobleman, says, he never made a bad figure but as a poet. As a soldier, his bravery was distinguished, his stratagems remarkable. As a statesman, it is sufficient to say, that he had the confidence of Cromwell. As a man, he was grateful, and would have supported the son of his friend: but, like Cicero and Richelieu, he could not be content without being a poet; though he was ill qualified, his writings of that kind being flat and trivial.

BOYLE (Robert), one of the greatest philosophers as well as best men that our own or indeed any other nation has produced, was the seventh son and the 14th child of Richard earl of Cork, and born at Lismore in the province of Munster in Ireland, January 25. 1626-7. Before he went to school, he was taught to write a very fair hand, and to speak French and Latin, by one of the earl's chaplains, and a Frenchman that he kept in the house. In the year 1635, his father sent him over to England, in order to be educated at Eaton school, under Sir Henry Wotton, who was the earl of Cork's old friend and acquaintance. Here he soon discovered a force of understanding which promised great things, and a disposition to cultivate and improve it to the utmost. While he remained at Eaton, there were several very extraordinary accidents that befel him, of which he has given us an account; and three of which were very near proving fatal to him. The first was, the sudden fall of the chamber where he was lodged, when himself was in bed; when, besides the danger he run of being crushed to pieces, he had certainly been choaked with the dust during the time he lay under the rubbish, if he had not had presence of mind enough to have wrapped his head up in the sheet, which gave him an opportunity of breathing without hazard. A little after this, he had been crushed to pieces by a starting horse that rose up suddenly, and threw himself backwards, if he had not happily disengaged his feet from the stirrups, and cast himself from his back before he fell. A third accident proceeded from the carelessness of an apothecary's servant,

N^o 52.

who, by mistaking the phials, brought him a strong vomit instead of a cooling julep.

Boyle.

He remained at Eaton, upon the whole, between three and four years; and then his father carried him to his own seat at Stalbridge in Dorsetshire, where he remained for some time under the care of one of his chaplains who was the parson of the place. In 1638, he attended his father to London; and remained with him at the Savoy, till his brother Mr Francis Boyle espoused Mrs Elizabeth Killigrew; and then, towards the end of October, within four days after the marriage, the two brothers, Francis and Robert, were sent abroad upon their travels, under the care of Mr Marcombes. They embarked at Rye in Suffex, and from thence proceeded to Dieppe in Normandy: then they travelled by land to Rowen, so to Paris, and from thence to Lyons; from which city they continued their journey to Geneva, where his governor had a family: and there the two gentlemen pursued their studies without interruption. Mr Boyle, during his stay here, resumed his acquaintance with the mathematics, or at least with the elements of that science, of which he had before gained some knowledge. For he tells us in his own memoirs, that while he was at Eaton, and afflicted with an ague, before he was ten years old, by way of diverting his melancholy, they made him read *Amadis de Gaul*, and other romantic books, which produced such a restlessness in him, that he was obliged to apply himself to the extraction of the square and cube roots, and to the more laborious operations of algebra, in order to fix and settle the volatile operations of his fancy.

In September 1641, he quitted Geneva, after having spent 21 months in that city; and passing through Switzerland and the country of the Grisons, entered Lombardy. Then, taking his rout through Bergamo, Brescia, and Verona, he arrived at Venice; where having made a short stay, he returned to the continent, and spent the winter at Florence. Here he employed his spare hours in reading the modern history in Italian, and the works of the celebrated astronomer Galileo, who died in a village near this city during Mr Boyle's residence in it. It was at Florence that he acquired the Italian language; which he understood perfectly, though he never spoke it so fluently as the French. Of this indeed he was such a master, that as occasion required he passed for a native of that country in more places than one during his travels.

About the end of March 1642, he began his journey from Florence to Rome, which took up but five days. He surveyed the numerous curiosities of that city; among which, he tells us, "he had the fortune to see Pope Urban VIII. at chapel, with the cardinals, who, severally appearing mighty princes, in that assembly looked like a company of common friars." He visited the adjacent villages which had any thing curious or antique belonging to them; and had probably made a longer stay, had not the heats disagreed with his brother. He returned to Florence; from thence to Leghorn; and so by sea to Genoa: then passing through the county of Nice, he crossed the sea to Antibes, where he fell into danger from refusing to honour the crucifix: from thence he went to Marseilles by land. He was in that city, in May 1642, when he received his father's letters, which informed him that the rebel-

lion

Boyle. lion had broken out in Ireland, and how difficultly he had procured the L. 250 then remitted to them in order to help them home. They never received this money; and were obliged to go to Geneva with their governor Marcombes, who supplied them with as much at least as carried them thither. They continued there a considerable time, without either advice or supplies from England; upon which Marcombes was obliged to take up some jewels upon his own credit, which were afterwards disposed of with as little loss as might be; and with the money thus raised, they continued their journey for England, where they arrived in the year 1644. On their arrival, Mr Boyle found his father dead; and though the earl had made an ample provision for him, by leaving him his manor of Stalbridge in England, as well as other considerable estates in Ireland, yet it was some time before he could receive any money. However, he procured protections for his estates in both kingdoms from the powers then in being; from which he also obtained leave to go over to France for a short space, probably to settle accounts with his governor Mr Marcombes.

In March 1646, he retired to his manor at Stalbridge, where he resided for the most part till May 1650. He made excursions sometimes to London, sometimes to Oxford; and in February 1647, he went over to Holland; but he made no considerable stay any where. During his retirement at Stalbridge, he applied himself with incredible industry to studies of various kinds, to those of natural philosophy and chemistry in particular. He omitted no opportunity of obtaining the acquaintance of persons distinguished for parts and learning; to whom he was in every respect a ready, useful, generous assistant, and with whom he held a constant correspondence. He was also one of the first members of that small but learned body of men which, when all academical studies were interrupted by the civil wars, secreted themselves about the year 1645; and held private meetings, first in London, afterwards at Oxford, for the sake of canvassing subjects of natural knowledge upon that plan of experiment which Lord Bacon had delineated. They styled themselves then *The philosophic college*; and, after the Restoration, when they were incorporated and distinguished openly, they took the name of the *Royal Society*.

In the summer of 1654, he put in execution a design he had formed for some time of residing at Oxford, where he chose to live in the house of one Mr Crosse, an apothecary, rather than in a college, for the sake of his health, and because he had more room to make experiments. Oxford was indeed the only place at that time in England where Mr Boyle could have lived with much satisfaction; for here he found himself surrounded with a number of learned friends, such as Wilkins, Wallis, Ward, Willis, Wren, &c. suited exactly to his taste, and who had resorted thither for the same reasons that he had done, the philosophical society being now removed from London to Oxford. It was during his residence here that he improved that admirable engine the air-pump; and by numerous experiments was enabled to discover several qualities of the air, so as to lay a foundation for a complete theory. He was not, however, satisfied with this; but laboured incessantly in collecting and digesting, chiefly from his own experiments, the materials requisite for this purpose. He

Boyle. declared against the philosophy of Aristotle, as having in it more words than things; promising much, and performing little; and giving the inventions of men for indubitable proofs, instead of building upon observation and experiment. He was so zealous for, and so careful about, this true method of learning by experiment, that though the Cartesian philosophy then made a great noise in the world, yet he would never be persuaded to read the works of Des Cartes, for fear he should be amused and led away by plausible accounts of things founded on conjecture, and merely hypothetical. But philosophy, and inquiries into nature, though they engaged his attention deeply, did not occupy it entirely; since we find that he still continued to pursue critical and theological studies. In these he had the assistance of some great men, particularly Dr Edward Pocock, Mr Thomas Hyde, and Mr Samuel Clarke, all of great eminence for their skill in the oriental languages. He had also a strict intimacy with Dr Thomas Barlow, at that time head keeper of the Bodleian library, and afterwards bishop of Lincoln, a man of various and extensive learning. In the year 1659, Mr Boyle, being acquainted with the unhappy circumstances of the learned Sanderson, afterwards bishop of Lincoln, who had lost all his preferments on account of his attachment to the royal party, conferred upon him an honorary stipend of 50l. a-year. This stipend was given as an encouragement to that excellent mauler of reasoning to apply himself to the writing of "Cases of Conscience;" and accordingly he printed his lectures *De obligatione conscientie*, which he read at Oxford in 1647, and dedicated them to his friend and patron.

Upon the restoration of Charles II. Mr Boyle was treated with great civility and respect by the king, as well as by the two great ministers the lord treasurer Southampton and the lord chancellor Clarendon. He was solicited by the latter to enter into holy orders, not only out of regard to him and his family, but chiefly with a view to serve the church itself; for Mr Boyle's noble family, his distinguished learning, and, above all, his unblemished reputation, induced Lord Clarendon to think that any ecclesiastical preferments he might attain would be worthily discharged, so as to do honour to the clergy, and service to the established communion. Mr Boyle considered all this with due attention: but, to balance these, he reflected, that, in the situation of life in which he was, whatever he wrote with respect to religion would have so much the greater weight as coming from a layman; since he well knew that the irreligions fortified themselves against all that the clergy could offer, by supposing, and saying, that it was their trade, and that they were paid for it. He considered likewise, that, in point of fortune and character, he needed no accessions; and indeed he never had any appetite for either. He chose, therefore, to pursue his philosophical studies in such a manner as might be most effectual for the support of religion; and began to communicate to the world the fruits of these studies.

The first of these was printed at Oxford in 1660, in 8vo, under the title of, 1. New experiments, physico-mechanical, touching the spring of the air and its effects. 2. Seraphic love; or some motives and incentives to the love of God, pathetically discours'd of in a

Boyle.

letter to a friend. 3. Certain physico-logical essays and other tracts, 1661, 4to. 4. Sceptical chemist, 1662, 8vo: a very curious and excellent work, reprinted about the year 1679, 8vo, with the addition of divers experiments and notes about the producibleness of chemical principles.

In the year 1663, the royal society being incorporated by king Charles II. Mr Boyle was appointed one of the council; and as he might be justly reckoned among the founders of that learned body, so he continued one of the most useful and industrious of its members during the whole course of his life. In June 1663, he published, 5. Considerations touching the usefulness of experimental natural philosophy, 4to. 6. Experiments and considerations upon colours; to which was added a letter, containing, Observations on a diamond that shines in the dark, 1663, 8vo. This treatise is full of curious and useful remarks on the hitherto unexplained doctrine of light and colours; in which he shows great judgment, accuracy, and penetration; and may be said to have led the way to that mighty genius the great Sir Isaac Newton, who has since set that point in the clearest and most convincing light. 7. Considerations on the style of the Holy Scriptures, 1663, 8vo. It was an extract from a larger work, intitled, *An essay on scripture*; which was afterwards published by Sir Peter Pett, a friend of Mr Boyle's.

In 1664, he was elected into the company of the royal mines; and was all this year taken up in the prosecution of various good designs, which probably was the reason why he did not send abroad any treatises either of religion or philosophy. The year following, came forth, 8. Occasional reflections upon several subjects; whereto is prefixed a discourse about such kind of thoughts, 1665, 8vo. This piece is addressed to *Sophronia*, under whose name he concealed that of his beloved sister the viscountess of Ranelagh. The thoughts themselves are on a vast variety of subjects, written many years before; some indeed upon trivial occasions, but all with great accuracy of language, much wit, more learning, and in a wonderful strain of moral and pious reflection. Yet this exposed him to the only severe censure that ever was passed upon him; and that too from no less a man than the celebrated Dean Swift, who, to ridicule these discourses, wrote *A pious meditation upon a broomstick, in the style of the honourable Mr Boyle*. But as his noble relation the late Lord Orrery has said, "To what a height must the spirit of sarcasm arise in an author, who could prevail on himself to ridicule so good a man as Mr Boyle? The sword of wit, like the scythe of time, cuts down friend and foe, and attacks every object that lies in its way. But, sharp and irresistible as the edge of it may be, Mr Boyle will always remain invulnerable."

The same year, he published an important work, intitled, 9. New experiments and observations upon cold, 1665, 8vo. In the year 1666, he published, 10. Hydrostatical paradoxes made out by new experiments, for the most part physical and easy, in 8vo. 11. The origin of forms and qualities, according to the copulcular philosophy, illustrated by considerations and experiments. This treatise did great honour to Mr Boyle, whether we consider the quickness of his wit, the depth of his judgment, or his indefatigable pains in searching after truth. We must not forget to observe,

Boyle.

that, both in this and the former year, he communicated to his friend Mr Oldenburgh, who was secretary to the royal society, several curious and excellent short treatises of his own, upon a great variety of subjects, and others transmitted to him by his learned friends both at home and abroad, which are printed and preserved in the Philosophical Transactions.

In the year 1668, Mr Boyle resolved to settle in London for life; and removed for that purpose to the house of his sister, the lady Ranelagh, in Pall-Mall. This was to the infinite benefit of the learned in general, and particularly to the advantage of the royal society, to whom he gave great and continual assistance, as the several pieces communicated to them from time to time, and printed in their Transactions, do abundantly testify. Those who applied to him, either to desire his help, or to communicate to him any new discoveries in science, he had his set hours for receiving; otherwise, it is easy to conceive that he would have had very little of his time for himself. But, besides these, he kept a very extensive correspondence with persons of the greatest figure, and most famous for learning, in all parts of Europe. In the year 1669, he published, 12. A continuation of new experiments touching the weight and spring of the air; to which is added, A discourse of the atmospheres of consistent bodies: and the same year he revised and made many additions to several of his former tracts, some of which were now translated into Latin, in order to gratify the curious abroad. 13. Tracts about the cosmical qualities of things; cosmical suspensions; the temperature of the subterraneous regions; the bottom of the sea: to which is prefixed an introduction to the history of particular qualities. This book occasioned much speculation, as it seemed to contain a vast treasure of knowledge which had never been communicated to the world before; and this too grounded upon actual experiments, and arguments justly drawn from them, instead of that notional and conjectural philosophy which in the beginning of the 17th century had been so much in fashion.

In the year 1671, he published, 14. Considerations on the usefulness of experimental and natural philosophy; the second part, 4to. And, 15. A collection of tracts upon several useful and important points of practical philosophy, 4to. Both of which works were received as new and valuable gifts to the learned world. 16. An essay about the origin and virtues of gems, 1672, 8vo. 17. A collection of tracts upon the relation between flame and air; and several other useful and curious subjects: besides furnishing, in this and the former year, a great number of short dissertations upon a vast variety of topics, addressed to the royal society, and inserted in their Transactions. 18. Essays on the strange subtilty, great efficacy, and determinate nature, of effluvia; to which were added a variety of experiments on other subjects; 1673, 8vo. 19. A collection of tracts upon the saltness of the sea, the moisture of the air, the natural and preternatural state of bodies; to which is prefixed a dialogue concerning cold; 1674, 8vo. 20. The excellency of theology compared with philosophy, 1673, 8vo. This discourse was written in the year 1665, while Mr Boyle, to avoid the great plague which then raged in London, was forced to go from place to place in the country, and had little or no opportunity of consulting his books. It contains a

great

Boyle. great number of curious and useful, as well as just and natural, observations. 21. A collection of tracts containing suspicions about hidden qualities of the air; with an appendix touching celestial magnets; animal-versions upon Mr Hobbes's problem about a vacuum; a discourse of the cause of attraction and friction; 1674, 8vo. 22. Some considerations about the reconcileableness of reason and religion. By T. E. a layman. To which is annexed a discourse about the possibility of the resurrection. By Mr Boyle. 1675, 8vo. The reader must be informed, that both these pieces were of his writing; only he thought fit to mark the former with the final letters of his name. Among other papers that he communicated this year to the royal society, there were two connected into one discourse: the first was intitled, An experimental discourse of quicksilver growing hot with gold; the other related to the same subject; and both of them contained discoveries of the utmost importance.

In the year 1676, he published, 23. Experiments and notes about the mechanical origin or production of particular qualities, in several discourses on a great variety of subjects, and among the rest on electricity. In 1678, he communicated to Mr Hook a short memorial of some observations made upon an artificial substance that shines without any preceding illustration; which that gentleman thought fit to publish in his *Lectures Caterianæ*. 24. Historical account of a degradation of gold made by an anti elixir. This made a great noise both at home and abroad, and is looked upon as one of the most remarkable pieces that ever fell from his pen; since the facts contained in it would have been esteemed incredible, if they had been related by a man of less integrity and piety than Mr Boyle. The regard which the great Newton had for Mr Boyle, appears from a very curious letter, which the former wrote to him, at the latter end of this year, for the sake of laying before him his sentiments of that ethereal medium, which he afterwards considered in his *Optics* as the cause of gravitation. This letter is to be found in the life of our author by the reverend Dr Birch.

In the year 1680, Mr Boyle published, 25. The aerial noctiluca; or some new phenomena, and a process of a facitious self-shining substance, 8vo. This year the royal society, as a proof of the just sense of his great worth, and of the constant and particular services which through a course of many years he had done them, made choice of him for their president; but he being extremely, and, as he says, peculiarly tender in point of oaths, declined the honour done him, by a letter addressed to "his much respected friend Mr Robert Hooke, professor of mathematics at Gresham College." 26. Discourse of things above reason; inquiring, whether a philosopher should admit any such; 1681, 8vo. 27. New experiments and observations upon the icy noctiluca: to which is added a chemical paradox, grounded upon new experiments, making it probable that chemical principles are transmutable, so that out of one of them others may be produced: 1682, 8vo. 28. A continuation of new experiments, physico-mechanical, touching the spring and weight of the air, and their effects, 1682, 8vo. In 1683, he published nothing but a short letter to Dr Beale, in relation to the making of fresh water out of salt. In 1684, he pub-

lished two very considerable works, viz. 29. Memoirs for the natural history of human blood, especially the spirit of that liquor, 8vo; and, 30. Experiments and considerations about the porosity of bodies, 8vo.

In 1685, Mr Boyle obliged the world with, 31. Short memoirs for the natural experimental history of mineral waters, with directions as to the several methods of trying them; including abundance of new and useful remarks, as well as several curious experiments. 32. A essay on the great effects of even languid and unheated motion; whereunto is annexed an experimental discourse of some hitherto little regarded causes of the salubrity and insalubrity of the air, and its effects. None of his treatises, it is said, were ever received with greater or more general applause than this. 33. Of the reconcileableness of specific medicines to the corporeal philosophy; to which is annexed a discourse about the advantages of the use of simple medicines; 8vo. Besides these philosophical tracts, he gave the world, the same year, an excellent theological one, 34. Of the high veneration man's intellect owes to God, peculiarly for his wisdom and power, 8vo.

At the entrance of the succeeding year, came abroad his, 35. Free inquiry into the vulgarly received notion of nature; a piece which was then, and will always be, greatly admired by those who have a true zeal and relish for pure religion and philosophy. In 1687, he published, 36. The martyrdom of Theodora and Didymia; a work he had drawn up in his youth. 37. A dissertation about the final causes of natural things; wherein it is inquired, whether, and (if at all) with what caution, a naturalist should admit them; with an appendix about vitiated light; 1682, 8vo. In the month of May this year, our author, though very unwilling, was constrained to make his complaint to the public, of some inconveniences under which he had long laboured; and this he did by an advertisement, about "the loss of many of his writings addressed to J. W. to be communicated to those of his friends that are virtuosi; which may serve as a kind of preface to most of his mutilated and unfinished writings." He complains in this advertisement of the treatment he had met with from plagiarists both at home and abroad; and though it might have been difficult in any other man to have done so without incurring the imputation of self-conceit and vanity, yet Mr Boyle's manner is such as only to raise in us an higher esteem and admiration of him. This advertisement is inserted at length in his life by Birch.

He began now to find that his health and strength, notwithstanding all his care and caution, gradually declined, as he observes in a letter to Mr Le Clerc, dated May 30th, 1689; which put him upon using every possible method of husbanding his remaining time for the benefit of the learned. It was with this view that he no longer communicated particular discourses, or new discoveries, to the royal society; because this could not be done without withdrawing his thoughts from tasks which he thought of still greater importance. It was the more steadily to attend to these, that he resigned his post of governor of the corporation for propagating the gospel in New-England; nay, he went so far as to signify to the world that he could no longer receive visits as usual, in an advertisement which begins in the following manner: "Mr Boyle finds himself

Boyle.

obliged to intimate to those of his friends and acquaintance, that are wont to do him the honour and favour of visiting him, 1. That he has by some unlucky accidents, namely, by his servant's breaking a bottle of oil of vitriol over a chest which contained his papers, had many of his writings corroded here and there, or otherwise so maimed, that, without he himself fill up the lacunæ out of his memory or invention, they will not be intelligible. 2. That his age and sickness have for a good while admonished him to put his scattered and partly defaced writings into some kind of order, that they may not remain quite useless. And, 3. That his skilful and friendly physician, Sir Edmund King, seconded by Mr Boyle's best friends, has pressingly advised him against speaking daily with so many persons as are wont to visit him, representing it as what cannot but waste his spirits, &c. He ordered likewise a board to be placed over his door, with an inscription signifying when he did, and when he did not, receive visits."

Among the other great works, which by this means he gained time to finish, there is great reason to believe, that one was a collection of elaborate processes in chemistry; concerning which he wrote a letter to a friend, which is still extant; wherein we read, that "he left it as a kind of hermetic legacy to the studious disciples of that art." Besides these papers committed to the care of one whom he esteemed his friend, he left very many behind him at his death, relating to chemistry; which, as appears by a letter directed to one of his executors, he desired might be inspected by three physicians whom he named, and that some of the most valuable might be preserved.

In the mean time, Mr Boyle published some other works before his death; as, 38. *Medicina Hydrostatica*; or, Hydrostatics applied to the materia medica, showing how, by the weight that divers bodies used in physic have in water, one may discover whether they be genuine or adulterated. To which is subjoined a previous hydrostatical way of estimating ores. 1690, 8vo. 39. The Christian virtuoso; showing, that, by being addicted to experimental philosophy, a man is rather assisted than indisposed to be a good Christian. To which are subjoined, 1. A discourse about the distinction that represents some things as above reason, but not contrary to reason. 2. The first chapters of a discourse intitled *Greatness of mind promoted by Christianity*. The last work which he published himself, was in the spring of 1691; and is intitled, 40. *Experimenta et Observationes Physicæ*: wherein are briefly treated of several subjects relating to natural philosophy in an experimental way. To which is added a small collection of strange reports. 8vo.

About the entrance of the summer, he began to feel such an alteration in his health as induced him to think of settling his affairs; and accordingly, on the 18th of July, he signed and sealed his last will, to which he afterwards added several codicils. In October, his distempers increased; and on the last day of December 1691, he departed this life, in the 65th year of his age. He was buried in St Martin's church in the Fields, Westminster, on the 7th of January following; and his funeral sermon was preached by Dr Gilbert Burnet, bishop of Salisbury. The bishop made choice upon this occasion of a text very apposite to the subject; namely,

"For God giveth to a man that is good in his fight, wisdom, knowledge, and joy *." After explaining the meaning of the words, he applied the doctrine to the honourable person deceased; of whom, he tells us, he was the better able to give a character from the many happy hours he had spent in conversation with him, in the course of 29 years. He gives a large account of Mr Boyle's sincere and unaffected piety; and more especially of his zeal for the Christian religion, without having any narrow notions concerning it, or mistaking, as so many do, a bigotted heat in favour of a particular sect, for that zeal which is an ornament of a true Christian. He mentions, as a proof of this, his noble foundation for lectures in defence of the gospel against infidels of all sorts; the effects of which have been so conspicuous in the many volumes of excellent discourses which have been published in consequence of that noble and pious foundation. He was at the charge of the translation and impression of the New Testament into the Malayan tongue, which he sent over all the East Indies. He gave a noble reward to him that translated Grotius's incomparable book "Of the truth of the Christian religion" into Arabic; and was at the charge of a whole impression, which he took care should be dispersed in all the countries where that language was understood. He was resolved to have carried on the impression of the New Testament in the Turkish language; but the company thought it became them to be the doers of it, and so suffered him only to give a large share towards it. He was at 700*l.* charge in the edition of the Irish bible, which he ordered to be distributed in Ireland; and he contributed liberally to the impression of the Welsh bible. He gave, during his life, 300*l.* to advance the design of propagating the Christian religion in America; and as soon as he heard that the East India company were entertaining propositions for the like design in the east, he sent 100*l.* for a beginning, as an example, but intended to carry it much farther when it should be set on foot to purpose.

In other respects his charities were so bountiful and extensive, that they amounted, as this prelate tells us, from his own knowledge, to upwards of 1000*l.* a-year. But as our limits will not allow us to follow the bishop in the copious and eloquent account he has given of this great man's abilities, we must therefore content ourselves with adding the short eulogium by the celebrated physician, philosopher, and chemist, Dr Herman Boerhaave; who, after having declared lord Bacon to be the father of experimental philosophy, asserts, that "Mr Boyle, the ornament of his age and country, succeeded to the genius and inquiries of the great chancellor Verulam. Which (says he) of all Mr Boyle's writings shall I recommend? All of them. To him we owe the secrets of fire, air, water, animals, vegetables, fossils: so that from his works may be deduced the whole system of natural knowledge." The reader perhaps may here be pleased to know, that Mr Boyle was born the same year in which lord Bacon died.

As to the person of this great man, we are told, that he was tall, but slender; and his countenance pale and emaciated. His constitution was so tender and delicate, that he had divers sorts of cloaks to put on when he went abroad, according to the temperature

Boyle.

* Eccl. xi. 26.

Boyle. of the air; and in this he governed himself by his thermometer. He escaped indeed the small-pox; but for almost forty years he laboured under such feebleness of body, and such lowness of strength and spirits, that it was astonishing how he could read, meditate, make experiments, and write, as he did. He had likewise a weakness in his eyes; which made him very tender of them, and extremely apprehensive of such distempers as might affect them. He imagined likewise, that if sickness should confine him to his bed, it might raise the pains of the stone to a degree which might be above his strength to support; so that he feared his last minutes should be too hard for him. This was the ground of all the caution and apprehension with which he was observed to live; but as to life itself, he had that just indifference for it which became a philosopher and a Christian. However, his sight began to grow dim not above four hours before he died; and when death came upon him, he had not been above three hours in bed, before it made an end of him, with so little pain that the flame appeared to go out merely for want of oil to maintain it.

Mr Boyle was never married; but Mr Evelyn was assured, that he courted the beautiful and ingenious daughter of Cary earl of Monmouth, and that to this passion was owing his "Seraphic Love." In the memorandum of Mr Boyle's life set down by bishop Burnet, it is remarked that he abstained from marriage, at first out of policy, afterwards more philosophically; and we find by a letter of Dr John Wallis to him, dated at Oxford, July 17th, 1669, that he had an overture made him with respect to the lady Mary Hallings, sister to the earl of Huntingdon: But it does not appear from any of his papers, that he had ever entertained the least thoughts of that kind; nay, there is a letter of his, wrote when he was young, to the lady Barrymore his niece, who had informed him of a report that he was actually married, which almost shows that he never did. The letter is written with great politeness, and in the true spirit of gallantry; and is a clear proof, that though Mr Boyle did not choose to marry, yet it was no misanthropic cynical humour which restrained him from it. It is impossible to entertain the reader better than by presenting him with that part of it which concerns the point in question. "It is high time for me to hasten the payment of the thanks I owe your ladyship for the joy you are pleased to wish me, and of which that wish possibly gives me more than the occasion of it would. You have certainly reason, madam, to suspend your belief of a marriage, celebrated by no priest but Fame, and made unknown to the supposed bridegroom. I may possibly ere long give you a fit of the spleen upon this theme; but at present it were incongruous to blend such pure raillery, as I ever prate of matrimony and amours with, among things I am so serious in as those this scribble presents you. I shall therefore only tell you, that the little gentleman and I are still at the old defiance. You have carried away too many of the perfections of your sex to leave enough in this country for reducing so stubborn a heart as mine; whose conquest were a task of so much difficulty, and so little worth it, that the latter property is always likely to deter any that hath beauty and merit enough to overcome the former. But though this untamed heart be thus insensible to the thing itself called *Love*; it is yet very acce-

Boyle. sible to things very near of kin to that passion; and esteem, friendship, respect, and even admiration, are things that their proper objects fail not proportionably to exact of me, and consequently are qualities which in their highest degrees are really and constantly paid my lady Barrymore by her most obliged humble servant, and affectionate uncle, ROBERT BOYLE."

We shall conclude this account of Mr Boyle with the mention of his posthumous works, which are as follows. 1. "The general History of the air designed and begun." 2. "General heads for the natural history of a country, great or small; drawn out for the use of travellers and navigators." 3. "A paper of the honourable Robert Boyle's, deposited with the secretaries of the Royal Society, October 14th, 1680, and opened since his death; being an account of his making the phosphorus, September 30th, 1680." Printed in the Philosophical Transactions. 4. "An account of a way of examining waters, as to freshness or saltness." 5. "A free discourse against customary swearing, and a dissuasive from cursing," 1695, 8vo. 6. "Medicinal experiments, or a collection of choice remedies, chiefly simple and easily prepared, useful in families, and fit for the service of the country people. The third and last volume, published from the author's original manuscript; whereunto is added several useful notes explanatory of the same." 1698, 12mo. Beautiful editions of all his works have been printed at London, in 5 volumes folio, and 6 volumes 4to.

BOYLE (Charles) earl of Orrery in Ireland, and baron of Malton in the county of Somerset, was the second son of Roger the second earl of Orrery, and was born in August 1679. He was educated at Christ-church in Oxford, and soon distinguished himself by his learning and abilities. Like the first earl of Orrery, he was an author, a soldier, and a statesman. He translated the life of Lyfander from the Greek of Plutarch; and published a new edition of the epistles of Phalaris, which engaged him in a literary dispute, in which he defended the genuineness of these epistles against Dr Bentley. He was three times member for the town of Huntingdon; but his elder brother, Lionel earl of Orrery, dying on the 23d of August 1703, without issue, he succeeded to that title; and, entering into the Queen's service, had a regiment given him, when he behaved with such bravery, that in 1709 he was raised to the rank of major-general, and sworn one of her majesty's privy council. At the famous battle of the wood, he gave the strongest proofs of his intrepid courage, remaining at the head of his regiment in the warmest part of the action, till the victory was complete, which, as it was one of the most glorious, so it was the dearest bought, of any of that war. His lordship had the honour of being appointed the Queen's envoy to the states of Brabant and Flanders; and having honourably discharged that trust, was raised to the dignity of a British Peer, by the title of lord Boyle, baron of Malton in Somersetshire. He enjoyed several other additional honours in the reign of King George I.; but having the misfortune to fall under the suspicion of the government, his lordship was committed to the tower: he was, however, at length, admitted to bail; and nothing being found that could be deemed a sufficient ground for a prosecution, he was discharged. His lordship died August 28th 1731, in the

Boyle
Boyle.

66th year of his age. To his tutor, Mr Atterbury, he probably owed a good part of that fine relish he had for the writings of the ancients. He made these his constant study, and expressed a high contempt, says Budgell, for the greater part of our modern wits and authors. He was delighted with the company of two sorts of persons; either such as were really geniuses of the first rank, who had fine understandings, strong judgments, and true tastes; or such as had a few foibles, and an eye of ridicule in them, which served to make him laugh. He would rally these in so agreeable, and yet in so tender a manner, that, though it diverted himself and others, it was never offensive to the person rallied. The instrument which was invented by him, and bears his name, representing the solar system according to the sentiments of the new astronomers, is an undeniable proof of his mechanic genius. His lordship had also a turn for medicine; which led him not only to buy and read whatever was published on that subject, but also to employ his friends to send him accounts of herbs and drugs in foreign countries.

BOYLE (John), earl of Cork and Orrery, a nobleman distinguished by his learning and genius, was the only son of Charles earl of Orrery, and was born on the 2d of January, 1707. He was educated at Christ-church college in Oxford: but, as he himself declares, early disappointments, indifferent health, and many untoward accidents, rendered him fond of retirement, and of improving his talents for polite literature and poetry; of which last art he gave several excellent specimens. He also wrote a Translation of Pliny the Younger's letters, with various notes, for the service of his eldest son the lord Boyle, in two volumes, 4to. This was first published in 1751. The year following, he published the Life of Dean Swift, in several letters, addressed to his second son Hamilton Boyle; and afterwards printed Memoirs of Robert Cary earl of Monmouth, a manuscript presented to him by a relation, with explanatory notes. He died in 1762.

BOYLE'S Lectures, a course of eight sermons or lectures preached annually, set on foot by the honourable Robert Boyle, Esq; by a codicil annexed to his will in 1691; whose design, as expressed by the institutor, is, to prove the truth of the Christian religion against infidels, without descending to any controversies among Christians; and to answer new difficulties, scruples, &c. For the support of this lecture he assigned the rent of his house in Crooked-lane to some learned divine within the bills of mortality, to be elected for a term not exceeding three years, by the late Archbishop Tennison and others. But the fund proving precarious, the salary was ill paid: to remedy which inconveniences, the said archbishop procured a yearly stipend of L. 50 for ever, to be paid quarterly, charged on a farm in the parish of Brill in the county of Bucks. To this appointment we are indebted for many elaborate defences both of natural and revealed religion.

BOYNE, a river in Ireland, which rises in Queen's county in the province of Leinster, and runs north-east by Tim and Cavan, falling at last into the Irish channel a little below Drogheda. It is memorable for a battle fought on its banks between James II. and King William III. in which the former was defeated.

BOYSE, Boys, or Bois (John), one of the trans-

lators of the Bible in the reign of James I. was son of William Bois, rector of West Stowe, near St Edmundsbury, Suffolk, and born at Nettlestead in Suffolk on the 3d of January 1560. He was taught the first rudiments of learning by his father; and his capacity was such, that at the age of five years he read the Bible in Hebrew. He went afterwards to Hadley school; and at 14 was admitted of St John's college, Cambridge, where he distinguished himself by his skill in Greek. Happening to have the small-pox when he was elected fellow, he, to preserve his seniority, caused himself to be carried in blankets to be admitted. He applied himself for some time to the study of medicine; but, fancying himself affected with every disease he read of, he quitted that science. He was ten years chief Greek lecturer in his college, and read every day. He voluntarily read a Greek lecture for some years at four in the morning, in his own chamber, which was frequented by many of the fellows. On the death of his father, he succeeded him in the rectory of West Stowe. At the age of 36, he married the daughter of Mr Holt, rector of Boxworth in Cambridgeshire; whom he succeeded in that living, October 13. 1596. On his quitting the university, the college gave him L. 100. His young wife, who was bequeathed to him with the living, which was an adownfall, proving a bad economist, and he himself being wholly addicted to his studies, he soon became so much involved in debt, that he was obliged to sell his choice collection of books, consisting of almost every Greek author then extant. When a new translation of the Bible was by King James I. directed to be made, Mr Bois was elected one of the Cambridge translators. He performed not only his own, but also the part assigned to another, with great reputation; though with no profit, for he had no allowance but his commons. He was also one of the six who met at Stationers Hall to revise the whole; which task they went through in nine months, having each from the company of stationers, during that time, 30s. a-week. He afterwards assisted Sir Henry Saville in publishing the works of St Chryostom. In 1615, Dr Laneclot Andrews, bishop of Ely, bestowed on him, unasked, a prebend in his church. He died on the 14th of January 1643, in the 84th year of his age. He left a great many manuscripts behind him, particularly a Commentary on almost all the books of the New Testament.—When he was a young student at Cambridge, he received from the learned Dr Whitaker three rules for avoiding those distempers which usually attend a sedentary life, to which he adhered with equal constancy and success. The first was, To study always standing; the second, Never to study in a window; and the third, Never to go to bed with his feet cold.

BOYSE (Joseph), a late eminent dissenting minister in Dublin, much respected not only for learning and abilities, but his extensive humanity and undissembled piety. During his ministerial charge at Dublin, he published many sermons which compose several folio volumes, a few poems, and other tracts; but what chiefly distinguished him as a writer, was the controversy he carried on with Dr King, archbishop of Dublin, and author of the *Origin of Evil*, concerning the office of a scriptural bishop. This controverted point was managed on both sides with great force of argument and culmness

Boyle.

calmness of temper. The bishop asserted, that the episcopal right of jurisdiction had its foundation in the New Testament: Mr Boyle, consistent with his principles, denied that any ecclesiastical superiority appeared there, with the greatest candour and good manners. He was father to

BOYLE (Samuel), the poet, a man remarkable for the lineaments of his genius, the lowness of his manners, and the wretchedness of his life. He was born in 1708, and received the rudiments of his education in a private school in Dublin. When he was but 18 years old, his father, who probably intended him for the ministry, sent him to the university of Glasgow, that he might finish his education there. He had not been a year at the university, when he fell in love with the daughter of a tradesman in that city, and was imprudent enough to interrupt his education by marrying her before he had entered into his 20th year. The natural extravagance of his temper soon exposed him to want; and as he had now the additional charge of a wife, his reduced circumstances obliged him to quit the university, and go over with his wife (who also carried a sister with her) to Dublin, where they relied on the old gentleman for support. Young Boyle was of all men the furthest removed from a gentleman; he had no graces of person, and fewer still of conversation. Never were three people of more libertine characters than young Boyle, his wife, and sister-in-law; yet the two ladies wore such a mask of decency before the old gentleman, that his fondness was never abated. The estate his father possessed in Yorkshire was sold to discharge his debts; and when the old man lay in his last sickness, he was entirely supported by presents from his congregation, and buried at their expence. We have no further account of Mr Boyle, till we find him soon after his father's death at Edinburgh. At this place his poetical genius raised him many friends, and some patrons of very great eminence. He published a volume of poems in 1731, to which are subjoined *The Tullatire of Coler*, and *A letter upon Liberty*, inserted in the *Dublin journal* 1726; and by these he obtained a very great reputation. They are addressed to the countess of Eglington. This amiable lady was the patroness of all men of wit, and greatly distinguished Mr Boyle while he resided in that country. Upon the death of the viscountess Stormont, Mr Boyle wrote an elegy, which was very much applauded by her ladyship's relations. This elegy he intitled *The tears of the muses*, as the deceased lady was a woman of the most refined taste in the sciences, and a great admirer of poetry. The lord Stormont was so much pleased with this mark of esteem paid to the memory of his lady, that he ordered a very handsome present to be given to Mr Boyle by his attorney at Edinburgh. The notice which lady Eglington and the lord Stormont took of our poet, recommended him likewise to the patronage of the duchess of Gordon; who was so solicitous to raise him above necessity, that she employed her interest in procuring the promise of a place for him. She gave him a letter, which he was next day to deliver to one of the commissioners of the customs at Edinburgh. It happened that he was then some miles distant from the city; and the morning on which he was to have rode to town with her grace's letter of recommendation proved to be rainy. This slender circumstance was enough to discourage Boyle, who never

looked beyond the present moment: he declined going to town on account of the rainy weather; and while he let slip the opportunity, the place was bestowed upon another, which the commissioner declared he kept for some time vacant in expectation of seeing a person recommended by the duchess of Gordon. Boyle at last having defeated all the kind intentions of his patroness towards him, fell into contempt and poverty, which obliged him to quit Edinburgh. He communicated his design of going to London to the duchess of Gordon; who, having still a very high opinion of his poetical abilities, gave him a letter of recommendation to Mr Pope, and obtained another for him to Sir Peter King the lord chancellor of England. Lord Stormont recommended him to the solicitor-general his brother, and many other persons of the first fashion. Upon receiving these letters, he, with great caution, quitted Edinburgh, regretted by none but his creditors. Upon his arrival in London, he went to Twickenham, in order to deliver the duchess of Gordon's letter to Mr Pope; but that gentleman not being at home, Mr Boyle never gave himself the trouble to repeat his visit. He wrote poems; but those, though excellent in their kind, were lost to the world, by being introduced with no advantage. He had so strong a propensity to groveling, that his acquaintance were generally of such a cast as could be of no service to him; and those in higher life he addressed by letters, not having sufficient confidence or politeness to converse familiarly with them. Thus unfit to support himself in the world, he was exposed to variety of distresses, from which he could invent no means of extricating himself but by writing mendicant letters. It will appear amazing, that this man, of so abject a spirit, was voluptuous and luxurious: he had no taste for any thing elegant, and yet was to the last degree expensive. Can it be believed, that often when he had received but a guinea in consequence of a supplicating letter, he would go into a tavern, order a supper to be prepared, drink of the richest wines, and spend all the money that had just been given him in charity, without having any one to participate the regale with him, and while his wife and child were starving at home?

It was about the year 1745, that Mr Boyle, reduced to the last extremity of human wretchedness, had not a shirt, a coat, or any kind of apparel, to put on; the sheets in which he lay were carried to the pawn-brokers, and he was obliged to be covered to his bed with no other covering than a blanket. He had little support but what he got by writing letters to his friends in the most abject style; but was perhaps ashamed to let this instance of his distress be known, which probably was the occasion of his remaining six weeks in that situation. During this time he had some employment in writing verses for the Magazines; and whoever had seen him in his study, must have thought the object singular enough: he sat up in bed with the blanket wrapt about him, through which he had cut a hole large enough to admit his arm, and, placing the paper upon his knee, scribbled in the best manner he could the verses he was obliged to make; whatever he got by those, or any other of his begging letters, was but just sufficient for the preservation of life. And perhaps he would have remained much longer in this distressful state, had not a compassionate gentleman, upon hearing this circumstance related, ordered his

^{Boyle} clothes to be taken out of pawn, and enabled him to appear again abroad.

About the year 1745, Mr Boyle's wife died. He was then at Reading, and pretended much concern when he heard of her death. His business at Reading was to compile a Review of the most material transactions at home and abroad during the last war: in which he has included a short account of the late rebellion. Upon his return from Reading, his behaviour was more decent than it had ever been before; and there were some hopes that a reformation, though late, would be wrought upon him. He was employed by a bookseller to translate *Fenelon on the existence of God*; during which time he married a second wife, a woman in low circumstances, but well enough adapted to his taste. He began now to live with more regard to his character, and supported a better appearance than usual; but while his circumstances were mending, and his irregular appetites losing ground, his health visibly declined. He had the satisfaction, while in this lingering illness, to observe a poem of his, intitled *The Deity*, recommended by two eminent writers, the ingenious Mr Fielding, and the reverend Mr James Hervey author of *The Meditations*.

Mr Boyle's mind was often religiously disposed; he frequently talked upon that subject, and probably suffered a great deal from the remorse of his conscience. The early impressions of his good education were never entirely obliterated; and his whole life was a continued struggle between his will and reason, as he was always violating his duty to the one, while he fell under the subjection of the other. It was in consequence of this war in his mind, that he wrote a beautiful poem called *The Recantation*. In May 1749, he died in obscure lodgings near Shoe-lane; but in sentiments, there is the greatest reason to believe, very different from those in which he had spent the greatest part of his life. An old acquaintance of his endeavoured to collect money to defray the expences of his funeral, so that the scandal of being buried by the parish might be avoided: but in vain; the remains of this son of the muses were, with very little ceremony, hurried away by the parish-officers.

Never was a life spent with less grace than that of Mr Boyle, and never were such distinguished abilities given to less purpose. His genius was not confined to poetry only: he had a taste for painting, music, and heraldry; with the latter of which he was very well acquainted. His poetical pieces, if collected, would make six moderate volumes. Many of them are scattered in *The Gentleman's Magazine*, marked with the letter *Z*, and *Alceus*. Two volumes were published in London. An ode of his in the manner of Spenser, intitled *The Olive*, was addressed to Sir Robert Walpole, which procured him a present of ten guineas. He translated a poem from the High Dutch of Van Haren, in praise of peace, upon the conclusion of that made at Aix-la-Chapelle; but the poem which procured him the greatest reputation was that upon the attributes of the Deity. He was employed by Mr Ogle to translate some of Chaucer's tales into modern English, which he performed with great spirit, and received at the rate of three pence a line for his trouble. Mr Ogle published a complete edition of that old poet's *Canterbury Tales modernized*; and Mr Boyle's name is put to such tales

as were done by him. In 1743, Mr Boyle published, without his name, an ode on the battle of Dettingen, intitled *Albion's Triumph*. Bozolo
||
Brabejun

BOZOLO, a town of Italy, in the duchy of Mantua, capital of a territory of the same name, and subject to the house of Austria. E. L. 10. 25. N. L. 45. 9.

B QUADRO, QUADRATO, or *Durale*, in music, called by the French *b quarte*, from its figure \sharp . This is what we call *B natural* or *sharp*, in distinction to *B mol* or *flat*. See *FLAT* and *SHARP*.

If the flat \flat be placed before a note in the thorough bass, it intimates, that its third is to be minor; and if placed with any cypher over a note in the bass, as $\flat 6$, or $\flat 5$, &c. it denotes, that the fifth or sixth thereto are to be flat. But if the quadro \sharp be placed over any note, or with a cypher, in the thorough bass, it has the contrary effect; for thereby the note or interval thereto is raised to its natural order.

BRABANCONES, in middle-age writers, a kind of Netherland soldiery, infamous for rapine, being little better than commissioned banditti, who hired themselves to fight for any that could pay them best. The word is variously written by the historians of those days; all given them from the country of Brabant, which was the chief nursery of those troops. They are also frequently confounded with the *Routiers*, *Routuriers*, *Ruptarii*, *Ruterarii*, *Corteraux*, &c.

BRABANT, a large province of the Netherlands, with the title of a duchy. It is bounded on the north by the province of Holland and the duchy of Guelderland; on the east, by the same duchy and the bishopric of Liege; on the south, by the province of Namur and Hainhalt; and on the west, by Zealand. It is divided into Dutch Brabant and Austrian Brabant; watered by several rivers, of which the Scheld, the Rupper, and the Dommel, are the chief. The soil is very fertile; and it contains 26 fortified towns, of which Brussels is the capital.

BRABEJUM, the AFRICAN ALMOND: A genus of the monoecia order, belonging to the polygamia class of plants. In the male the corolla is four-parted; there are four stamina inverted in the throat; the style is bifid and abortive: The female has a four-parted corolla, revolved upwards, with four stamina, one pistil with two stigmas; the fruit is a roundish drupa with a globular seed. Of this genus there is but one species, viz. the stellatifolium, which is a native of the Cape of Good Hope. In Europe it seldom grows above eight or nine feet high, but in its native soil is a tree of a middling growth. It rises with an upright stem, which is soft, and full of pith within, and covered with a brown bark. The leaves come out all round the branches at each joint: they are indented at their edges, standing on very short foot-stalks. The flowers are produced towards the end of their shoots, which are of a pale colour inclining to white. This may be propagated, though with difficulty, by layers made in April; but they are often two years before they produce roots strong enough to be taken from the plants. When the branches are laid down, it will be proper to slit them at the point (as is practised in laying carnations), which will promote their taking root. In winter, the plants should have a good greenhouse; but in summer they should be placed abroad in a sheltered situation.

BRABEUTES, or **BRABEUTA**, in antiquity, an officer among the Greeks, who presided at the public games, and decided controversies that happened among the antagonists in the gymnistical exercises. The number of brabeutæ was not fixed; sometimes there was only one, but more commonly they amounted to nine or ten.

BRACCIANO, a town of St Peter's patrimony, about 12 miles north of Rome, situated on the west side of a lake to which it gives name. E. Long. 13°. N. Lat. 42°.

BRACCIOLINI (Francis), an Italian poet, a native of Postoina, and the friend of Pope Urban VIII. died about the year 1644, aged 80. He wrote, 1. An epic poem, intitled, The cross reconquered, under the emperor Heraclius. 2. An heroic poem, intitled, The mockery of the Pagan gods. 3. The election of Pope Urban VIII. in 23 books.

BRACE is commonly taken for a couple or pair, and applied by huntsmen to several beasts of game, as a brace of bucks, foxes, hares, &c.

BRACE, or *Brasse*, is also a foreign measure, answering to our fathom. See **FATHOM**.

BRACE, in architecture, a piece of timber framed in with bevil joints, the use of which is to keep the building from swerving either way. When the brace is framed into the kingstiles or principal rafters, it is by some called a *strut*.

BRACE, in writing or printing, a crooked line inclosing a passage, as in a triplet.

BRACES, in the sea-language, are ropes belonging to all the yards of a ship, except the mizen, two to each yard, reeved through blocks that are fastened to pennants, seized to the yard-arms. Their use is either to square or traverse the yards. Hence to brace the yard, is to bring it to either side. All braces come aftward on; as, the main brace comes to the poop, the main-top-sail brace comes to the mizen-top and thence to the main shrouds, the fore and fore-top-sail braces come down by the main and main-top-sail stays, and so of the rest. But the mizen-bowline serves to brace to the yard, and the cross-jack braces are brought forwards to the main shrouds, when the ship sails close by a wind.

BRACES of a Coach, thick straps of leather on which it hangs.

BRACELET, an ornament worn on the wrist, much used among the ancients: it was made of different materials, and in different fashions, according to the age and quality of the wearer. The word is French, *bracelet*; which Menage derives further from *bracteolum*, a diminutive of *bracile*, a word occurring in writers of the Julian age; all formed from the Latin *brachium*, *arm*. It amounts to the same with what was called by the ancients, *armilla*, *brachiale*, *oculus*; in the middle age, *hoga*, *bauga*, *armispatha*.

Bracelets are much worn by the savages of Africa, who are so excessively fond of them, as to give the richest commodities, and even their fathers, wives, and children, in exchange for those made of no richer materials than shells, glass-beads, and the like.

They form also, in modern civilized countries, a very common part of the ornaments of the ladies.

BRACHIÆUS, the name of a muscle. See **ANATOMY**, *Table of the Muscles*.

Cracca-**BRACHIALIS**. See **ANATOMY**, *ibid.*

BRACHIUM, or **ARM**. See **ANATOMY**, n° 48, &c.

BRACHMINS, or **BRACHMANS**, a branch of the ancient Gymnosophists, or philosophers of India, remarkable for the severity of their lives and manners. See the article **GYMNOSOPHISTS**.

Some say they derive their name from the patriarch Abraham, whom they call in their language *Brachmi*, or *Brama*. Others deduce it from the name of their god *Brachma*; which some again take to be the same with Abraham: whence Pottel calls them *Abrahamites*. F. Thomassin derives the word from the Hebrew *brach*, to fly or escape: because the Brachmans retire into the country and live in deserts. The same author gives us another derivation, *viz.* from the Hebrew *brach*, (*benedicere*, or *are*), to bless or pray; in regard this is their principal occupation.—The Greeks ascribe to them the doctrine of the immortality of the soul, and certain notions concerning the nature of the Supreme Being and future rewards and punishments. To this species of knowledge the Brachmans added an infinite number of religious observances, which were adopted by Pythagoras in his school; such as fasting, prayer, silence, and contemplation. They were looked upon as the friends of the gods, because they affected to pay them so much regard; and as the protectors of mankind, because they paid them no regard at all. No bounds were therefore set to the respect and gratitude that were shown them: princes themselves did not scruple to consult these recluses upon any critical conjuncture, from a supposition, no doubt, that they were inspired; since it was impossible to imagine that they had the advantages of experience. We can scarcely, however, deny, that there might be among them some men of real virtue, whose minds relished the pure and ingenious delights of study and science; and who, by nobly raising their thoughts to the contemplation of the First Being, must have had more powerful incitements to render themselves worthy of his care, and none to justify them in deceiving and tyrannizing over their fellow-creatures.

There appear still some remains of the ancient brachmans in the east, under the denomination of Bramins. See **BRAMINS**.

BRACHYGRAPHY, the art of short-hand-writing. See **SHORT-HAND**.

BRACHYLOGY, (from *βραχυ*: and *λογος* “expression”), in rhetoric, the expressing any thing in the most concise manner. This, so far as consistent with perspicuity, is a virtue and beauty of style; but if obscurity be the consequence, which is often the case, it becomes a blemish and inexcusable defect.—Quintilian gives an instance of brachylogy from Sallust: *Mithridates corpore ingenti perinde armatus*: “Mithridates, as it were, armed with the hugeness of his stature.”

BRACHYPTERA, a term used by Willoughby, to denote those hawks which have their wings so short as not to reach to the end of the tail. Of this kind are the goshawk, sparrow hawk, &c.

BRACHYPYRENEA, in the history of fossils, a genus of septaria, with a short roundish nucleus. See **SEPTARIA**.

BRACHYTELOSTYLA, in natural history, the name by which Dr Hill calls those crystals which are composed of a short hexangular column terminated at each end by an hexangular pyramid. See **CRYSTAL**.

Brachialis

Brachy-
logy.

Bracket
||
Bracton.

BRACKET, among carpenters, &c. a kind of wooden stay, serving to support shelves and the like.

BRACKETS, in a ship, the small knees, serving to support the galleries, and commonly carved. Also the timbers that support the gratings in the head are called *brackets*.

BRACKETS, in gunnery, are the cheeks of the carriage of a mortar: they are made of strong planks of wood, of almost a semicircular figure, and bound round with thick iron plates; they are fixed to the beds by four bolts, which are called *bed-bolts*; they rise up on each side of the mortar, and serve to keep her at any elevation, by means of some strong iron bolts, called *bracket-bolts*, which go through these cheeks or brackets.

BRACKLAU, a strong town in Poland, capital of a palatinate of the same name. The houses are built of wood. It was taken by the Turks in 1672, but retaken three years afterwards. It is seated on the river Bog, in E. Long. 29. 20. N. Lat. 48. 5.

BRACKLAW, a palatinate of that name, which is the eastern part of Podolia; it is also called *Lower Podolia*, and is of greater extent than Upper Podolia, but is more desolate, on account of the neighbourhood of the Tartars.

BRACKLEY, a borough-town in Northamptonshire, in England, seated on the edge of the county, next Buckinghamshire, on a branch of the river Ouse. It is an ancient and large corporation-town, containing two parish-churches; is governed by a mayor and aldermen; and sends two members to parliament. It had formerly a college, which is turned into a free school. W. Long. 1. 15. N. Lat. 52. 0.

BRACTEA, in natural history, denotes a spangle, or thin flake of any substance.

BRACTEA, in botany, a thin leaf or plate of any *folium florale*, ranged by Linnaeus among the *fulcra* of plants. These floral leaves differ in shape and colour from the other *folia* of the plant; are generally situated on the pedunculus, and often so near the corolla as to be easily mistaken for the *calyx*; than which, however, the *bractea* are generally more permanent. Examples of the floral leaves are seen in the *tilia*, *fumaria bulbosa*, *lavendula*, and *horminum*.

BRACKTEARIA, in natural history, a genus of tales, composed of small plates in form of spangles, each plate either being very thin, or fissile into very thin ones.

Of this genus there are a great many species, called, from their different colours, *mica aurea*, or gold-glimmer; and *mica argentea*, silver-glimmer, or cats-silver, &c.

BRACTON (Henry), lord chief justice of England in the reign of Henry III. was probably a native of Devonshire. He was educated at Oxford, where he took the degree of doctor of laws, and was made one of the itinerant judges about the year 1244. Ten years after, he became chief justice, and had the earl of Derby's house in London assigned him for his town residence, during the minority of that nobleman. He is said to have filled this important office with singular reputation during 20 years. When he died is not known; probably it was in the reign of Edward I. He wrote *De legibus et consuetudinibus Angliae*, which

is one of the most ancient, and also most methodical books on our laws. His method is copied from Justinian. This work was printed at London in 1569, folio; and in 1640, 4to. The first is very incorrect.

BRAD, a town of Slavonia, seated on the north side of the river Save, in E. Long. 18. 40. N. Lat. 45. 20.

BRADFIELD, a town of Essex in England, in E. Long. 0. 30. N. Lat. 51. 14.

BRADFORD, a town of Wiltshire in England, seated in W. Long. 2. 40. N. Lat. 51. 20.

BRADFORD (John), a divine, and martyr to the reformation, was born in the former part of the reign of Henry VIII. at Manchester in Lancashire. Being a remarkable penman and accountant, he became secretary to Sir John Harrington, who was several times employed by king Henry, and his successor Edward VI. as paymaster to the troops abroad. Bradford at this time was a gay man, and to support his extravagance made free with the king's money; but being at last unable to support the reflection of his guilt, he determined to make restitution, and actually repaid the money. Quitting his employment of secretary, about the year 1547, he took chambers in the inner temple, and for some time studied the law; but finding in himself an inclination to preach the gospel, in the following year he removed to Catharine-hall in Cambridge, where he applied with such uncommon assiduity to the study of divinity, that in a much shorter time than usual he was admitted to the degree of master of arts, and soon after made fellow of Pembroke hall. Bishop Ridley, who, in 1550, was translated to the see of London, charmed with Bradford's application and zeal, now sent for him to the metropolis, ordained and appointed him his chaplain. In 1553, he was also made chaplain to Edward VI. during which time he became one of the most popular preachers in the kingdom. Such a reformer was too dangerous to be suffered in the succeeding reign. Mary was hardly in possession of the crown, before Bradford's persecutions began. He was first confined in the tower for sedition, where he continued a year and an half; during which time he wrote several epistles that were dispersed in various parts of the kingdom. He was afterwards removed to other prisons, and at last brought to his trial before that infernal court of inquisition in which Gardiner sat as chief inquisitor, where he defended his principles to the last, in contempt of their utmost power. They condemned him to the flames; and he was accordingly burnt alive in Smithfield, on July 1. 1555. His works are, 1. Seventy-two letters, written to various people, whilst the author was in prison; printed in Bishop Coverdale's collection. 2. Ten letters, printed in Fox's acts and monuments. 3. Complaint of verity, 1559, 8vo. 4. Three examinations before the commissioners, and his private talk with the priests, with the original of his life, 1561, octavo. 5. Two notable sermons, 1574, octavo, 1631. 6. Godly meditations and prayers, 1614, 24to. 7. Treatise of repentance, 1622. With several translations and other pieces.

BRADFORTH, a town in the west of Yorkshire, seated on a branch of the river Aire, in W. Long. 1. 35. N. Lat. 53. 40.

BRADLEY (Dr. James), a famous English astronomer,

Brad
||
Bradley

Bradley, nomer, was the third son of William and Jane Bradley, and was born at Sherborne in Dorsetshire in the year 1692.

He was fitted for the university at North Leach by Mr Egles, and Mr Brice, who kept a boarding school there; and from North Leach he was sent to Oxford. His friends intended him for the church, and his studies were regulated with that view; and as soon as he was of sufficient age to receive holy orders, the bishop of Hereford, who had conceived a great esteem for him, gave him the living of Bridgford, and soon after he was inducted to that of Welfrie in Penbrokeshire. But notwithstanding these advantages, from which he might promise himself still farther advancement in the church, he at length resigned his livings, that he might be wholly at liberty to pursue his favourite study the mathematics, and particularly astronomy. He was nephew to Mr Pound, a gentleman who is well known in the learned world by many excellent observations, and who would have enriched it with more, if the journals of his voyages had not been burnt at Pulo Condor, when the place was set on fire, and the English who were settled there cruelly massacred, Mr Pound himself very narrowly escaping with his life. With this gentleman, Mr Bradley passed all the time that he could spare from the duties of his function; and perhaps he sometimes trespassed upon them: he was then sufficiently acquainted with the mathematics to improve by Mr Pound's conversation; yet it does not appear that, in this study, he had any preceptor but his genius, or any assistant but his labour.

It may be easily imagined, that the example and conversation of Mr Pound did not render Bradley more fond of his profession than he was before; he continued, however, as yet to fulfil the duties of it, though at this time he had made such observations as laid the foundation of those discoveries which afterwards distinguished him as one of the greatest astronomers of his age. Though these observations were made as it were by stealth, they gained him at first the notice, and then the friendship, of the lord chancellor Macclesfield, Mr Newton afterwards Sir Isaac, Mr Halley, and many other members of the royal society, into which he was soon elected a member. About the same time, the chair of Savilian professor of astronomy became vacant by the death of the celebrated Dr Kiel; and Mr Bradley was elected to succeed him on the 31st of October 1721, being then just 29 years old; and his colleague was Mr Halley, who was professor of geometry on the same foundation. Bradley, upon his being elected into this professorship, gave up both his livings, and with great joy quitted a situation in which his duty was directly opposite to his inclination. From this time, he applied himself wholly to the study of his favourite science; and in the year 1727 he published his theory of the aberration of the fixed stars, which is allowed to be one of the most useful and ingenious discoveries of modern astronomy. Three years after this discovery, by which Mr Bradley acquired very great reputation, he was appointed lecturer in astronomy and physics, at the museum at Oxford.

He pursued his studies with equal application and delight; and in the course of his observations, which were innumerable, he discovered that the inclination of the earth's axis upon the plane of the ecliptic was not

always the same, but that it varied backwards and forwards some seconds, and that the period of these variations was nine years. This period seemed altogether unaccountable, as it could not be supposed to have any thing in common with the revolution of the earth, which is performed in one year. Mr Bradley, however, discovered the cause of this phenomenon in the Newtonian system of attraction. He published this discovery in 1737, so that in the space of about ten years he communicated to the world two of the finest discoveries in modern astronomy, which will for ever make a memorable epocha in the history of that science.

Mr Bradley always preserved the esteem and friendship of Mr Halley; who, being worn out by age and infirmities, thought he could do nothing farther for the service of astronomy, than procure for Mr Bradley the place of regius professor of astronomy at Greenwich, which he had possessed himself many years with the greatest reputation. With this view, he wrote many letters, which have been since found among Mr Bradley's papers, desiring his permission to apply for a grant of the reversion of it to him, and even offering to resign in his favour, if it should be thought necessary: but before Mr Halley could bring this kind project to bear, he died. Mr Bradley, however, obtained the place afterwards, by the favour and interest of my lord Macclesfield, who was afterwards president of the royal society. As soon as the appointment of Mr Bradley to this place was known, the university of Oxford sent him a diploma creating him doctor of divinity. The appointment of astronomer at Greenwich placed Mr Bradley in his proper element, and he pursued his observations with unwearied diligence. However numerous the collection of astronomical instruments at the observatory at Greenwich, it was impossible that such an observer as Dr Bradley should not desire to increase them, as well to answer those particular views, as in general to make observations with greater exactness. In the year 1748, therefore, he took the opportunity of the annual visit made by the royal society to the observatory, in order to examine the instruments and receive the professor's observations for the year, to represent so strongly the necessity of repairing the old instruments, and purchasing new, that the society thought proper to represent it to his majesty, and his majesty gave them £1000 for that purpose. This sum was laid out under the direction of Dr Bradley, who, with the assistance of the late celebrated Mr Graham and Mr Bird, furnished the observatory with as complete a collection of astronomical instruments, as the most skilful and diligent observer could desire. Dr Bradley, furnished with such assistance, pursued his observations with new assiduity, an incredible number of which were found after his death, and put into the hands of the royal society.

It has been already observed, that when Dr Bradley was elected to the professor's chair at Oxford, he gave up his two livings, which were at such a distance, that he could not possibly fulfil the duties of them himself; but it happened that after he was settled at Greenwich, the living of that parish became vacant, which is very considerable, and which was offered to him, as he was upon the spot to perform the duty, and had the claim of uncommon merit to the reward. This

Bradley. living, however, Dr Bradley, very greatly to his honour, refused, fearing the duties of the astronomer would too much interfere with those of the divine. His majesty, however, hearing of the refusal, was so pleased with it, that he granted him a pension of 250 l. a-year in consideration of his great abilities and knowledge in astronomy and other branches of the mathematics, which had procured so much advantage to the commerce and navigation of Great Britain, as is particularly mentioned in the grant which is dated the 15th of February 1752. Dr Bradley, about the same time, was admitted into the council of the royal society. In the year 1748, he was admitted a member of the royal academy of sciences and belles lettres of Berlin, upon the death of M. Crevier, first physician to his catholic majesty; in the year 1752, a member of the imperial academy at Petersburg; and in 1757, of that instituted at Bologna.

Dr Bradley was still indefatigable in his observations, and whatever honour he received became an incitement to obtain new distinction; his corporeal abilities, however, at length declined, though his intellectual suffered no abatement. In the year 1760, he became extremely weak and infirm; and towards the end of June 1762, he was attacked with a total suppression of urine, caused by an inflammation of the reins, which on the 12th of July following put an end to his life, in the 70th year of his age. He was buried at Mitchin-Hampton, in Gloucestershire, in the same grave with his mother and his wife. In the year 1744, he married Susannah Peach, the daughter of a gentleman of that name in Gloucestershire, by whom he had only one daughter.

As to his character, he was remarkable for a placid and gentle modesty, very uncommon in persons of an active temper and robust constitution. It was still more remarkable, that, with this untroubled equanimity of temper, he was compassionate and liberal in the highest degree. Although he was a good speaker, and possessed the rare but happy art of expressing his ideas with the utmost precision and perspicuity, yet no man was a greater lover of silence, for he never spoke but when he thought it absolutely necessary. He did indeed think it necessary to speak when he had a fair opportunity to communicate any useful knowledge in his own way; and he encouraged those that attended his lectures to ask him questions, by the exactness with which he answered, and the care he took to adapt himself to every capacity. He was not more inclined to write than to speak, for he has published very little: he had a natural diffidence, which made him always afraid that his works should injure his character; and therefore suppressed many, which probably were well worthy of the public attention. He was even known, as it were, in spite of himself; and, in spite of himself, he was known much, and consequently much esteemed. He was acquainted with many of the first persons in this kingdom, persons eminent as well for their rank as their abilities: he was honoured by all men of learning in general; and there was not an astronomer of any eminence in the world with whom he had not a literary correspondence. Upon the whole, it may be said of Dr Bradley, that no man cultivated great talents with more success, or had a better claim to be ranked among the greatest astronomers of his age.

BRADNINCH, a town of Devonshire, once a considerable place, but some time ago totally destroyed by fire. W. Long. 3. 35. N. Lat. 50. 45.

BRADS, among artificers, a kind of nails used in building, which have no spreading heads as other nails have. They are distinguished by iron-mongers by five names; as *joiner's brads*, *flooring-brads*, *batten-brads*, *bill-brads*, or *quarter-heads*, &c. Joiner's-brads are for hard wainscot; batten-brads are for soft wainscot; bill brads are used when a floor is laid in haste, or for shallow joists subject to warp. See NAIL.

BRADSHAW (Henry), a Benedictine monk, was born at Chester, about the middle of the 15th century. Discovering an early propensity to religion and literature, he was received while a boy into the monastery of St Werberg in that city; and having there imbibed the rudiments of his education, he was afterwards sent to Gloucester college, in the suburbs of Oxford, where for a time he studied theology with the novices of his order, and then returned to his convent at Chelster; here, in the latter part of his life, he applied himself chiefly to the study of history, and wrote several books. He died in the year 1513, the fifth of Henry VIII. His poetry is not inferior to that of any of his contemporaries. His works are, 1. *De antiquitate et magnificentia urbis Cestriae*. 2. *Chronicon*. 3. The life of the glorious virgin of St Werberg. Printed Lond. 1521, 4to, in verse. The life of St Werberg makes only part of this work; for it contains also a description of the kingdom of Mercia, life of St Etheldred, the life of St Sexburg, the foundation and history of Chester, and the chronicles of some kings. Possibly this work may include the two first. Bishop Tanner says, that he wrote a chronicle in English verse, extracted from Bede, Malmibury, Geraldus, and others. Probably this is the chronicle above mentioned.

BRADWARDIN (Thomas), archbishop of Canterbury, was born at Hartfield in Suffex, about the close of the 13th century. He was educated at Merton College, Oxford, where he took the degree of doctor of divinity; and acquired the reputation of a profound scholar, a skilful mathematician, and consummate divine. Authors are not agreed as to his first preferments. Pits says he was professor of divinity at Oxford. They agree, however, in asserting, that from being chancellor of the diocese of London, he became a courtier and confessor to Edward III. whom he constantly attended during his war with France, assisting that victorious prince with his advice, animating the troops, and fervently praying for their success. After his return from the war, he was made prebendary of Lincoln, and afterwards archbishop of Canterbury. He died at Lambeth in the year 1349, forty days after his consecration; and was buried in St Anselm's chapel, near the south wall. His works are, 1. *De causa Dei*, printed London, 1618, published by J. H. Savil. 2. *De geometria speculativa*, &c. Paris, 1495, 1512, 1530. 3. *De arithmetica practica*, Paris, 1502, 1512. 4. *De proportionibus*, Paris, 1495. Venice, 1505, folio. 5. *De quadratura circuli*, Paris, 1495, folio.

BRADY (Robert), born in Norfolk in 1643, was master of Caius college, Cambridge, regius professor there, and twice representative of that university in parliament. In 1685, he was made keeper of the records in the tower, and was physician in ordinary to James II.

Brady.
Bradypus.
He wrote, An introduction to the Old English history ; An history of England, from the time of the Romans to the end of the reign of Richard II. ; and, A treatise on English boroughs. He died in 1700.

BRADY (Nicholas), an excellent divine and poet, born at Bandon, in the county of Cork, October 28th 1659. He studied at Westminster-school, and afterwards at Oxford and Dublin college. He was a zealous promoter of the Revolution ; and, in 1690, when the troubles broke out in Ireland, by his interest with M^cCarty, king James's general, he thrice prevented the burning of the town of Bandon. Having quitted several preferments in Ireland, he settled in London, where he was successively promoted to several livings ; and at the time of his death was rector of Clapham, minister of Richmond, and chaplain to the Duke of Ormond's troop of horse-guards. He wrote part of the new version of the Psalms, now sung in many churches in England and Ireland ; the *Æneids* of Virgil, in 4 vols ; and 3 vols of sermons. He died May 20th 1726.

Plate.
X. fig. 6.
BRADYPUS, or SLOTH, a genus of quadrupeds, belonging to the order of bruta. The characters are these : They have no fore-teeth in either jaw ; the dog-teeth are blunt, solitary, and longer than the grinders ; they have five grinders on each side. The body is covered with hair. There are only two species of bradypus, viz.

1. The tridactylus, or American sloth, has a short tail, and only three toes on each foot. It is about the size of a fox. The body is covered over with hair of a grey colour ; the face is naked ; the throat is yellowish ; the fore-feet are longer than the hind feet ; the claws, which are three on each foot, are compressed, and very strong ; and they have no mammae on the breast ; they have no external ears, but only two winding holes. It is the most sluggish and most slow of all animals, and seems to move with the utmost pain. Its food is fruit, or the leaves of trees. If it cannot find fruit on the ground, it looks out for a tree well laden, and with great pain climbs up : to save the trouble of descending, it flings off the fruit ; and, forming itself into a ball, drops from the branches, continues at the foot till it has devoured all, nor ever rises till compelled by hunger. It never drinks, and is terrified at rain.

The following wonderful account of this animal, from Kircher's *Musurgia*, is quoted by Mr Stillingfleet in his miscellaneous tracts. "The description (says Kircher) I had from father Torus, who resided in America, who had animals of this kind in his possession, and made many experiments in relation to their nature and qualities. Its figure is extraordinary ; it is about the bigness of a cat, of very ugly countenance, and has claws extended like fingers. The hinder part of the head and neck are covered with hair. It sweeps the ground with its fat belly, never rises upon its feet, and moves so slowly, that it would scarce go the length of a bow-shot in 15 days, though constantly moving, and it is therefore called the sloth. It lives generally upon tops of trees, and employs two days to crawl up, and as many to get down again. Nature has doubly guarded this animal against its enemies. First, by giving it such strength in its feet, that whatever it seizes, it holds so fast, that it never can be freed from its claws, but must there die of hunger. Secondly, in giving it such a mo-

ving aspect, when it looks at any man who should be tempted to hurt it, that it is impossible not to be touched with compassion ; besides, that at the same time it sheds tears, and upon the whole persuades one, that a creature so defenceless, and of so unhappy a body, ought not to be tormented. To make an experiment of this, the above-mentioned father procured one of these animals to be brought to our college at Cathagona. He put a long pole under its feet, which it seized upon very firmly, and would not let go again. The animal therefore thus voluntarily suspended, was placed between two beams along with the pole, and there it remained without meat, drink, or sleep, 40 days ; its eyes being always fixed on people that looked at it, who were so touched, that they could not forbear pitying it. At last being taken down, they let loose a dog on it, which after a little while the sloth seized with his feet, and held him four days, till he died of hunger. This was taken from the mouth of the father. They add (continues Kircher), that this creature makes no noise but at night, but that very extraordinary. For by interruptions, that last about the length of a sigh or semi-pause, it goes through the six vulgar intervals of music, Ut, re, mi, fa, sol, la, La, sol, fa, mi, re, ut, ascending and descending, and these perfectly in tune. So that the Spaniards, when they first got possession of this coast, and heard these notes, imagined that some people brought up to our music were singing. This animal is called by the natives *haut* ; certainly because, going through these musical intervals, it repeats, Ha, ha, ha, ha, ha, &c." To this account Linnaeus seems, in his *Systema Naturæ*, to give credit. For he says, in his short way of description, among other things, "It utters an ascending hexachord : its noise is horrible ; its tears are piteous." He quotes Musgrave, Clusius, Gesner, &c.

2. The didactylus has two toes on each foot, and no tail : The head is round : the ears are large ; and it has two mammae on the breast : The body is covered with ash-coloured hair. It is a native of Ceylon.

BRAE-MAR, a mountainous territory of Scotland, in the shire of Aberdeen, where the last earl of Mar began to raise a rebellion in 1715. It is 27 miles north-west of Aberdeen.

Bray-Murray, a mountainous and woody tract of land, lying in the shires of Elgin and Nairn in Scotland.

BRAG, an ingenious and pleasant game at cards, where as many may partake as the cards will supply ; the eldest hand dealing three to each person at one time, and turning up the last card all round. This done, each gambler puts down three stakes, one for each card.—The first stake is won by the best card turned up in the dealing round ; beginning from the ace, king, queen, knave, and so downwards. When cards of the same value are turned up to two or more of the gamblers, the eldest hand gains ; but it is to be observed, that the ace of diamonds wins, to whatever hand it be turned up.—The second stake is won by what is called the *brag*, which consists in one of the gamblers challenging the rest to produce a card equal to his : Now it is to be observed, that a pair of aces is the best brag, a pair of kings the next, and so on ; and a pair of any sort wins the stake from the most valuable single card. In this part consists the great diversion of the game ;

Braga
||
Brahe.

for, by the artful management of the looks, gestures, and voice, it frequently happens, that a pair of fives, treys, or even duces, out-brags a much higher pair, and even some pairs royal, to the no small merriment of the company. The knave of clubs is here a principal favourite, making a pair with any other card in hand, and with any other two cards a pair royal.—The third stake is won by the person who first makes up the cards in his hand one and thirty; each dignified card going for ten, and drawing from the pack, as usual in this game.

BRAGA, the capital of the province of Entre-minhuro, in Portugal, situated on the river Cavado, in W. Long. 8. 40. N. Lat. 41. 20.

BRAGANZA, a city of Portugal, and capital of a duchy of the same name. It is seated on an eminence, by a brook called *Ferrenca*; and is divided into two parts, the old city, and the town. The former is upon an eminence, and fortified with a double wall. That part next the town has five bastions, but no ditch; the citadel is on the opposite side joined to the wall. The town is in a plain, and defended by a fort with four bastions. It is seated near the river Sabor on the frontiers of Galicia, in W. Long. 6. 15. N. Lat. 41. 27.

BRAGGOT, a kind of drink made of malt, honey, and spices, much used in Wales.

BRAHE (Tycho), a celebrated astronomer, descended of an illustrious family originally of Sweden but settled at Denmark, was born December 14th 1546, at Knudtorp in the county of Schonen. He was taught Latin when seven years old, and studied five years under private tutors. His father dying, his uncle sent him, in April 1559, to study philosophy and rhetoric at Copenhagen. The great eclipse of the sun on the 21st of August 1560, happening at the precise time the astronomers had foretold, he began to look upon astronomy as something divine; and purchasing the tables of Stadius, gained some notion of the theory of the planets. In 1562, he was sent by his uncle to Leipzig to study law; but astronomy wholly engrossed his thoughts, and in purchasing books on that science he employed all his pocket-money. Having procured a small celestial globe, he was wont to wait till his tutor was gone to bed, in order to examine the constellations and learn their names; and when the sky was clear, he spent whole nights in viewing the stars. In 1565, a difference arising between Brahe and a Danish nobleman, they fought, and the former had part of his nose cut off; which defect he so artfully supplied with one made of gold and silver, that it was not perceivable. It was about this time that he began to apply to chemistry, proposing nothing less than to obtain the philosopher's stone. In 1571, he returned to Denmark; and was favoured by his mother's brother, Steno Belle, a lover of learning, with a convenient place at his castle of Herritzvad near Knudtorp, for making his observations, and building a laboratory. His marrying a country girl, beneath his rank, occasioned such a violent quarrel between him and his relations, that the king was obliged to interpose to reconcile them. In 1574, by his majesty's command, he read lectures upon the theory of the comets at Copenhagen. The year following he began his travels through Germany, and proceeded as far as Venice: he then resolved to remove his family, and settle at Basil; but Frederic II. king

of Denmark being informed of his design, and unwilling to lose a man that was capable of being such an ornament to his country, promised to enable him to pursue his studies, to bestow upon him for life the island of Huen in the sound, to erect an observatory and laboratory there, and to defray all the expences necessary for carrying on his designs. Tycho Brahe readily embraced this proposal; and accordingly the first stone of the observatory was laid August 8. 1576. The king also gave him a pension of 2000 crowns out of his treasury, a fee in Norway, and a canony of Rothild, which brought him in 1000 more. James VI. of Scotland, afterwards raised to the crown of England, going to Denmark in order to marry the princess Anne, paid a visit to our author in his retirement at Uraniburg, made him several presents, and with his own hand wrote a copy of verses in his praise; but, soon after the death of king Frederic, he was deprived of his pension, fee, and canony; upon which, finding himself incapable of bearing the expences of his observatory, he went to Copenhagen, whither he brought some of his instruments, and continued his astronomical observations in that city, till Valkendorf, chamberlain to the household of Charles IV. commanded him by the king's order to discontinue them. He then removed his family to Rostock, and afterwards to Holstein, in order to solicit Henry Ranzou to introduce him to the emperor; and that gentleman complying with his request, he was received by the emperor at Prague with the utmost civility and respect. That prince gave him a magnificent house, till he could procure one for him more fit for astronomical observations; assigned him a pension of 3000 crowns; and promised, upon the first opportunity, a fee for him and his descendants: but he did not long enjoy this happy situation; for, upon the 24th of October 1601, he died of a retention of urine, in the 55th year of his age, and was interred in a very magnificent manner in the principal church at Prague, where a noble monument was erected to him.—His skill in astronomy is universally known, and he is famed for being the inventor of a new system, which he endeavoured, though without success, to establish upon the ruins of that of Copernicus. He was very credulous with regard to judicial astrology and presages. If he met an old woman when he went out of doors, or an hare upon the road on a journey, he used to turn back immediately, being persuaded that it was a bad omen. When he lived at Uraniburg, he had at his house a madman, whom he placed at his feet at table, and fed himself. As he imagined that every thing spoken by mad persons presaged something, he carefully observed all that this man said; and because it sometimes proved true, he imagined it might always be depended on. A mere trifle put him in a passion; and against persons of the first rank, with whom it was his duty to keep on good terms, he openly discovered his resentment. He was very apt to rally others, but highly provoked if the same liberty was taken with himself. His principal works are, 1. *Progymnasmata astronomicæ*. 2. *De mundi aetherei recentioribus phaenomenis*. 3. *Epistolarum astronomicarum liber*.

BRAHMA. See BRANA.

BRAIDALBIN, a district of Perthshire in Scotland, stretching 32 miles from east to west, and 13 where broadest from south to north; is a mountainous country,

Brahma,
Braidalbin.

country, lying among the Grampian hills, supposed to be the country anciently known by the name of *Albanii*; whence the Highlanders to this day call themselves *Albini*. It is bounded on the west by Lochaber, Lorn, and Knapdale; on the north and east, by part of Lochaber and part of Athol; and on the south by Strathern and Monteith. It produces plenty of game and black cattle; is inhabited by Highlanders said to be the most ferocious in all Scotland; and gives the title of earl to a branch of the Campbell family, which is possessed of a noble and magnificent seat in this division. Much flax is cultivated here. Some years ago, when premiums were given for the greatest crops, from 70 to 120 hogsheads of lintseed were annually sown, each peck yielding two stones of dressed flax; and when the yarn sold highest, L. 2000 worth has been sold out of the country. Oats and potatoes are the other crops. Oats yield from four to six fold at the most, oftener less; bear, from eight to ten, at an average six. The corn raised seldom suffices the number of inhabitants, so they are often obliged to have recourse to importation. From their potatoes some have distilled a very strong spirit, which has been found cheaper than what is distilled from any grain. Starch is also made from them; and, in some places, bread. Concur, or the lichen omphalides, is an article of commerce; great quantities have been scraped from the rocks, and exported for the use of the dyers, at the price of 1s. or 16d. per stone. A good many sheep are reared here, and much wool is sent out of the country. There are few horses raised in this country: such as feed on the tops of the higher hills are often afflicted with a distemper that commonly proves fatal, if a remedy is not applied within 24 hours. It attacks them in the months of July and August, usually after a fall of rain, or before the dew rises in the morning. An universal swelling spreads over the body: the remedy is exercise, chaming, or any method that promotes urine and perspiration. The common people attribute this evil to a certain animal that scatters its poison over the grass; but, more probably, it arises from some noxious vegetable hitherto unobserved. Before the year 1745, lord Braidalbin was obliged to keep a constant guard for the protection of his vastish cattle, or to retain spies among the thievish clans, having too much spirit to submit to pay an infamous tax, called *Black-meal*, to the plundering chieftains as the price of their safety.

BRAIL, or **BRAILS**, in a ship, are small ropes made use of to furl the sails across: they belong only to the two courses and the mizen-sail; they are reeved through the blocks, seized on each side the ties, and come down before the sail, being at the very skirt thereof fastened to the cringles; their use is, when the sail is furled across, to hale up its hunt, that it may the more easily be taken up or let fall. Hale up the brails, or brail up the sail; that is, Hale up the sail, in order to be furled or bound close to the yard.

BRALLOV, a town of Poland, in the province of Podolia, seated on the river Bog, in E. Long. 29. 0. N. Lat. 47. 50.

BRAIN, in anatomy, is that large, soft, whitish mass, inclosed in the cranium or skull; wherein all the organs of sense terminate, and the soul is supposed principally to reside. See ANATOMY, n^o 17, 129, 136.

Brain: le Comte, a town of the Austrian Netherlands, in the province of Hainault. E. Long. 4. 11. N. Lat. 50. 35.

BRAINTREE, a large town of Essex in England, situated in E. Long. 0. 35. N. Lat. 51. 50.

BRAKE, denotes female fern, or the place where it grows.—Also a sharp bit or snaffle for horses; and a baker's kneading-trough.—Also an instrument with teeth to bruise flax or hemp. See *Flax-Dressing*.

BRAKEL, a town of Germany, in the circle of Westphalia, and in the bishopric of Paderborn, seated on the rivulet Brucht, in E. Long. 9. S. N. Lat. 51. 46.

BRAMA, or **BRUMA**, a pagan deity of the East Indies. He is the first person of a kind of trinity in their theology; is the great progenitor of mankind; and has created as many worlds as there are considerable parts in his body. See the articles **BRACHMANS**, **BRAMANS**, and **INDOSTAN**.

BRAMA, in ichthyology, the trivial name of a species of cyprinus. See **CYPRINUS**.

BRAMANT, a town of Savoy, in the valley of Maurich, seated on the river Arck, in E. Long. 4. 15. N. Lat. 45. 0.

BRAMBER, a town of Suffex in England, formerly of some account, but has neither market nor fair; however, it sends two members to parliament. W. Long. 0. 15. N. Lat. 50. 50.

BRAMBLE, in botany, the English name of the **RUBUS**.

BRAMBLE-Net, otherwise called *hallier*, is a net to catch birds in of several sizes: the great meshes must be four inches square; those of the least size are three inches square; and those of the biggest, five. In the depth they should not be above three or four inches: but as for the length, they may be enlarged at pleasure; the shortest being 18 feet long.

BRAMBLE, or *Brambling*, in ornithology, the trivial name of a species of **FRINGILLA**.

BRAMER (Leonard), history-painter, was born at Delit in 1596; but learned the art of painting in the school of Rembrandt, and imitated the manner of his master in small. In the 18th year of his age he went to Rome for his improvement; but although he continued in Italy for some years, and acquired somewhat in his style rather more graceful than Rembrandt, yet he could never divest himself of the Flemish gout. He had a fine taste of design; his expression is generally good, and in some of his compositions truly noble. His pencil is delicate, and his colouring very peculiar in the tints, being also remarkably thin in many parts, so as barely to cover the panel; yet, by great skill in the management of the chiaro-scuro, his colouring is bright, bold, and full of life; particularly in the vases, which he was fond of introducing in every subject that could admit them, as he knew how to give them a rich and fine tincture. He had accustomed himself to paint with a very thin body of colour, especially in the browns and shadowy parts, in order to give his pictures a greater transparency. At Venice, Naples, Florence, Mantua, and other cities of Italy, as well as at Rome, he left many proofs of his extraordinary merit, which rendered his name deservedly famous; and his works are rarely to be met with out of Italy, where he painted most; but wherever they

Pillings: Dist.

Bramhall,
Bramins

are to be purchased they are bought at considerable prices, if they are entire and undamaged. One of the most capital pictures of Brammer is the *Raising of Lazarus*, in which there is a charming opposition of light and shadow; and another is the *Descent of St Peter*: They are both painted in his best manner; they are bright, transparent, and finely penciled, and are still preserved at Rome. Likewise at the palace of Ryfwick there are several valuable paintings by this master; in which the invention and execution are highly commendable. But none of his works can be more admired than a small picture on copper representing the story of Pyramus and Thisbe.

BRAMHALL (Dr John), archbishop of Armagh, was born of an ancient family at Pontefract in Yorkshire, about the year 1593. He was invited over to Ireland by the lord deputy Wentworth; and soon after obtained the arch-deaconry of Meath, the best in that kingdom. In 1634, he was made bishop of Londonderry, which see he improved very much; but the greatest service he did to the church of Ireland was by getting, with the deputy's assistance, several acts passed for abolishing tithes, recovering inappropriations, &c. by which and by other means he regained to the church in the space of four years £ 3,000 or £ 40,000 a-year. In the convocation he prevailed upon the church of Ireland to unite in the same faith with the church of England, by adopting the 39 articles of that church; and would willingly have introduced the English canons, but could only prevail on their accepting such as they deemed proper. Articles of treason were exhibited against him in the Irish parliament; and at the treaty of Uxbridge in 1644, the English parliament made it a preliminary article, that Bishop Bramhall, with Archbishop Laud, and others, should be excepted from the general pardon. He went abroad; but on the restoration was appointed archbishop of Armagh, primate and metropolitan of all Ireland, and was chosen speaker of the House of Lords. He died in 1663; and was the author of several works, which are collected in one vol. folio.

BRAMINS, the name of the priests among the idolatrous Indians; the successors of the ancient Brachmans. See the title BRACHMANS.

Their name is formed from *Brama*, their particular deity. They are found in Siam, Malabar, China, Coromandel, and most other eastern nations anywise civilized; but their chief seat is in Indostan, or the Mogul's country. They have a language peculiar to themselves, which they call *Shayfehit*; in which they have several ancient books, written, as is alleged, by their great prophet Brahma; as the *frashram*, which is their bible; and *perans*, a history which they esteem sacred, and pretend to have been dictated by God himself.

There are several orders of Bramins. Those who mix in society are for the most part very corrupt in their morals: they believe that the water of the Ganges will wash away all their crimes; and, as they are not subject to any civil jurisdiction, live without either restraint or virtue, excepting that character of compassion and charity which is so commonly found in the mild climate of India. The others, who live abstracted from the world, are either weak-minded men or enthusiasts; and abandon themselves to laziness, superstition, and the dreams of metaphysics. We find in their dis-

putes the very same ideas that occur in the writings of our most celebrated metaphysicians; such as, substance, accident, priority, posteriority, immutability, indivisibility, &c. Bramins.

Their religion, which was anciently of the allegorical and moral kind, hath degenerated into a heap of extravagant and obscene superstitions, owing to their having realized those fictions which were intended merely as so many symbols and emblems. Were it possible to obtain a light of their sacred books, the only remains there are of the Indian antiquities, we might in some measure be enabled to remove the veil that envelopes those numerous mysteries; but the following story will show how little reason there is to hope that we shall ever be intrusted with such a communication.

The emperor Mahmoud Akbar had an inclination to make himself acquainted with the principles of all the religious sects throughout his extensive provinces. Having discarded the superstitious notions with which he had been prepossessed by his education in the Mahometan faith, he resolved to judge for himself. It was easy for him to be acquainted with the nature of those systems that are formed upon the plan of making profelytes; but he found himself disappointed in his design when he came to treat with the Indians, who will not admit any person whatever to the participation of their mysteries. Neither the authority nor promises of Akbar could prevail with the Bramins to disclose the tenets of their religion; he was therefore obliged to have recourse to artifice. The stratagem he made use of was to cause a boy, of the name of Feizi, to be committed to the care of these priests, as a poor orphan of the sacerdotal line, who alone could be initiated into the sacred rites of their theology. Feizi, having received the proper instructions for the part he was to act, was conveyed privately to Benares, the seat of knowledge in Indostan; he was received into the house of a learned Bramin, who educated him with the same care as if he had been his own son. After the youth had spent ten years in study, Akbar was desirous of recalling him: but he was struck with the charms of the daughter of his preceptor. The women of the sacerdotal tribe are looked upon as the greatest beauties in Indostan. The old Bramin laid no restraint upon that growing passion of the two lovers: he was fond of Feizi, who had gained his affection by his address and docility; and offered him his daughter in marriage. The young man, divided between love and gratitude, resolved to conceal the fraud no longer; and falling at the feet of the Bramin, discovered the imposture, and asked pardon for his offence. The priest, without reproaching him in the least, seized a poniard which hung at his girdle, and was going to plunge it in his breast, if Feizi had not prevented him by taking hold of his arm. The young man used every means to pacify him, and declared himself ready to do any thing to expiate his treachery. The Bramin, bursting into tears, promised to pardon him on condition that he should swear never to translate the *Bedas* or sacred volumes, or disclose to any person whatever the symbol of the Bramin creed. Feizi readily promised all that the Bramin required: how far he kept his word is not known; but the sacred books of the Indians have never been translated by him, or any one else, to this day. As the Raynal's
Hist. of the
Indes.

+ See Indes
viii.

mins, Bramins are the only persons who understand the language of the sacred book, their comments on the text are the same as those that have ever been made on religious books; all the maxims which fancy, interest, passion, or false zeal can suggest, are to be found in these volumes. See the articles SHAFTAH and VEDAM.

They own a supreme God, who created Brama, and gave him a power to create the world. They have also their subaltern deities, their pagods or temples, and idols, whom they tan to defend from flies, dancing before them. They also hold a feast in honour of the sun, considered as the source of light and heat, whereby all nature is fecundified.

Their pagods or temples consist of three parts. The first is a vaulted roof, supported on stone columns: it lies open, and all persons, without distinction, are allowed to enter into it. It is adorned with symbolical figures, made of wood, as elephants, oxen, and horses. The second part is open in the day-time, and shut at night. It is filled with grotesque and monstrous figures, as men with many heads and arms. The third, which is a kind of channel, is kept always shut, with a very strong gate. In this is placed the statue of the deity to whom the pagod is dedicated. A great number of lamps burn day and night before the idol. The Bramins, before they go into the pagod, pull off their shoes, and leave them at the door.

The Bramins of Siam and Coromandel maintain that the earth will be destroyed by fire; and the former assert that another will arise out of its ashes, in which there shall be no sea, nor any change of seasons, but an eternal spring; and the latter maintain a plurality of worlds, which are alternately destroyed and renewed.

Robert de Nobili, an Italian Jesuit, and one of the Indian missionaries, in the beginning of the 17th century, in order to secure success to his mission, assumed the title and appearance of a Bramin, and at length persuaded the credulous people that he was in reality a member of that venerable order. He forged a deed in the ancient Indian characters, showing that the Bramins of Rome were older than those of India, and that the Jesuits of Rome descended in a direct line from the god Brahma. He farther declared on oath, that he derived his origin from this Indian deity. By this imposture he proselyted twelve eminent Bramins, whose influence proved very favourable to his mission. After his death, the Portuguese Jesuits carried on the imposture with very considerable success. These missions, however, were suspended and abandoned in consequence of a papal mandate, issued out in the year 1744, by Benedict XIV. who declared his disapprobation of the artifices that had been used in the conversion of the Indians. See further under the article OBSERVATORY.

BRAMPPOUR, or BRAMFORT, a city of Asia, in the dominions of the Great Mogul, and capital of Candish. It formerly stood on as much ground as London; but is now greatly decayed, and chiefly inhabited by Banians. The streets are numerous, but narrow, with low thatched houses made of earth, though a few are covered with varnished tiles. In rainy weather many of the streets are overflowed. In the marketplace is the statue of an elephant in red stone, as big as

the life. On the other side of the river they have built a new town, which is in a better situation. A great trade is carried on in this town, and throughout all the province, where there is made a prodigious quantity of cotton-cloth, as cotton is in greater plenty here than in any other place of the empire. E. Long. 77. 25. N. Lat. 21. 10.

BRAMPPTON, a town of Cumberland in England, seated not far from the Piets wall, and on the river Irthin. It is a very ancient place, but at present is very small. W. Long. 2. 40. N. Lat. 54. 50.

BRAN, the skins or husks of corn, especially wheat ground, separated from the flour by a sieve or bolster. It contains, besides, a portion of the farinaceous matter; this is less glutinous than the finer flour, and is supposed to have a detergent quality; infusions of bran are not infrequently employed in this intention externally, and sometimes likewise taken inwardly.

Among the ancients, bran was used as an erotic, to excite love. Bran boiled, purges scurf, dandruff, and cleanses the hands in lieu of soap. The dyers reckon it among the not-colouring drugs; and use it for making what they call the *four waters*, with which they prepare their several dyes. Bran is also used as a medicine for horses. See FARRIERY, § 1. 6.

BRANCH, in botany, an arm of a tree, or a part which, sprouting out from the trunk, helps to form the head or crown thereof. Branches do not spring out of the mere surface of the trunk, but are profoundly rooted therein, so as not only to penetrate the cortical, but also the woody substance, and even the pith. The constituent parts therefore of a *branch* are the same as of the trunk, viz. skin, bark, wood, and pith. See the article PLANTS.

BRANCHES of a Bridle, in the manage, are two pieces of iron banded, which, in the interval between the one and the other, bear the bit-mouth, the cross-chains, and the curb; so that on one end they answer to the head-stall, and on the other to the reins, in order to keep the horse's head in subjection. With regard to their form and structure, branches are either straight, in form of a pistol, for young horses to form their mouth; or after the constable of France's fashion, proper for a horse that carries his head well. Some are in form of a gigot or leg, which will prevent horses from carrying too low: Some are in form of a bent knee, contrived for horses that arm themselves against the operation of the bit; and others after the French fashion, which is hardly above $\frac{1}{2}$ of an inch at the teville hole, and kneed $1\frac{1}{2}$ inch at the jarret or ham.

It is to be observed, 1. That the farther the branch is from the horse's neck, the more effect it will have. 2. That short branches, *ceteris paribus*, are ruder, and their effects more sudden, than those of longer. 3. That the branch is to be proportioned to the length of a horse's neck; and one may sooner err in choosing one too short than too long.

Branches of Gothic, in architecture, are the arches of Gothic vaults. These arches, traversing from one angle to another diagonal wise, form a cross between the other arches, which make the sides of the square, of which the arches are diagonals.

Branen-Stand, with falconers, a term used to signify the making a hawk leap from tree to tree, till the dog springs the game.

Dramphton

Brancher
||
Branden-
b. rg.

BRANCHER, among sportsmen, a young hawk, newly taken out of the nest, that can hop from bough to bough.

BRANCHIÆ, or GILLS, in the anatomy of fishes, the parts corresponding to the lungs of land-animals. All fishes except the cetaceous ones, and the pteromyzium, which have lungs, are furnished with these organs of respiration. See *COMPARATIVE Anatomy*.

BRANCHIDÆ, in Grecian antiquity, priests of the temple of Apollo, which was at Didymus in Ionia, a province of lesser Asia, towards the Ægean sea, upon the frontiers of Caria. They opened to Xerxes the temple of Apollo, the riches whereof he took away. After which, thinking it unsafe to stay in Greece, they fled to Sogdiana, on the other side of the Caspian sea, upon the frontiers of Persia, where they built a city, called by their own name: but they did not escape the punishment of their crime; for Alexander the Great having conquered Darius king of Persia, and being informed of their treachery, put them all to the sword, and razed their city, thus punishing the impiety of the fathers in their posterity.

BRANCHIOSTEGI, in *Ichthyology*, a term used to express one of the general classes of fishes: the characters of which are, that the rays of the fins are of a bony substance; but these fish have no bones or ossicula at the branchia, as the malacopterygious and acanthopterygious fishes all have.

BRANCHON, a town of the Austrian Netherlands, in the province of Namur, seated on the river Mehaigne. E. Long. 4. 40. N. Lat. 50. 32.

BRAND-SUNDAY, *Dimanche des Brandons*, in French ecclesiastical writers, denotes the first Sunday in Lent: which is thus called on account of an ancient practice in the Lyonnais, where the peasants, in the night of this day, walked about their orchards, gardens, &c. with torches lighted, or fire-brands in their hands; in which plight they visited every tree, and addressing themselves to them one after another, threatened that if they did not bear fruit well the ensuing season, they should be cut down to the ground and burnt. This is evidently a relic of paganism; the like of which was practised by the ancient idolaters in the month of February; hence called *Februarius, à sè-bruando*.

BRANDEIS, a town of Bohemia, seated on the river Elbe. E. Long. 14. 25. N. Lat. 50. 15.

BRANDENBURG (Marquisate of), a large county of Germany, having Mecklenburgh and Pomerania on the north; Poland, on the east; Silesia, with the Lusatins, the electorate of Saxony, Anhalt, and duchy of Magdeburg, on the south; and part of the same duchy, and that of Lunenburg, on the west. Its greatest length is near 200 miles, and its greatest breadth near 100. Its northern situation makes it very cold for seven or eight months in winter. The soil in general is far from being fruitful, a great part of it consisting of sand: yet there are several fruitful spots in it; and the whole, under the last and present reign, has been greatly improved, and much better peopled. In some parts there is great plenty of potatoes and turnips; in others of buck wheat, millet, and flax; in others of tobacco, woad, and other herbs for dyeing. All sorts of colour earths, together with alum, salt-

petre, amber, iron, stone, and medicinal springs, are found in it. Abundance of cattle, especially sheep, are bred here; and the woods not only supply the inhabitants with fuel, but with timber, charcoal, tar, and wood-ashes, both for domestic uses and for exportation. The culture of silk also is carried on in this country with great success. The principal rivers by which it is watered are the Elbe, the Oder, the Prignitz, the Havel, the Warte, and the Spree. Some of the rivers and lakes abound in fish, and are united by canals, for the benefit of navigation. They reckon in the whole Mark 120 towns, above 2500 villages, and about 800,000 inhabitants. The states here consist of the nobility and towns, whose assembly-house is in the Spandau-street at Berlin, and who still enjoy some small remains of their ancient privileges. The hereditary offices of the marquisate are a marshal, chamberlain, cup-bearer, purveyor, sewer, treasurer, and ranger. The king of Prussia, who is also elector of Brandenburg, with his whole court, are Calvinists; but the religion of most of the inhabitants is Lutheranism. The churches of both persuasions are well endowed, and the laity jointly employed by the government. The Roman-catholics are also tolerated here. In short, every inhabitant enjoys full liberty of conscience. A great variety of manufactures, most of which were introduced by the French refugees, are carried on in the marquisate, especially at Berlin and Potsdam; where are also excellent painters, statuaries, and engravers. By means of these manufactures, fabrics, and arts, not only large sums are kept in the country, but also imported from other parts, to which considerable quantities of the manufactures, and natural productions, are exported. For the education of youth, and the advancement of learning, besides Latin schools in several places, and gymnasia, there is an university at Frankfort on the Oder, and an academy of sciences at Berlin.

The Brandenburg family is of great antiquity. Some historians say it was founded by the Slavonians, who gave it the name of *Branier*, which signifies the "Guards of the Forests;" and the Germans called it *Braburgh*. Henry I. surnamed the Fowler, fortified this place in the year 923, to serve as a rampart against the Huns, a warlike nation, who were extremely troublesome by their frequent incursions. He bestowed the government on Sifro, Count of Ringelheim, with the title of Margrave or Marquis, which signifies Protector of the Marches or Frontiers, in 923. It descended to Geron, Margrave of Lusatia; which, in succession of time, passed into the families of Staden, Ascania, Bellenstadt, and that of Bavaria, till the Emperor Sigismund, with the consent of the states of the empire in 1416, gave perpetual investiture to Frederick VI. of Nuremberg; who also, the following year, received from the Emperor, at the diet of Constance, the investiture of the county of Brandenburg as Frederick I. having had previously conferred upon him the dignity of elector and arch-chamberlain of the holy Roman empire.

Brandenburg remained long in subjection to Poland; and the investiture of Prussia was granted by the Polish kings to each succeeding margrave. Frederick-William, having concluded a treaty with the king of Poland, was acknowledged to be sovereign of Ducal Prussia

Brandenburg.

Prussia by an assembly of the states at Konigsberg A. D. 1663. By the treaty of Vienna the Emperor confirmed this title; and Frederick, the son of Frederick-William, was proclaimed king of Prussia Jan. 18. 1701. He was succeeded by his son, who performed the greatest services to his country, and prepared the materials of the future grandeur of the late sovereign, Frederick III. who began his reign on the 31st of May 1740, at the age of 28. See PRUSSIA.

Among the electors he possesses the seventh place. As arch-chamberlain, he carries the sceptre before the emperor at his coronation, and brings him water in a silver basin to wash with. In the college of princes of the empire, he has five voices. His assessment, as elector, is 60 horse and 277 foot, or 1828 florins in lieu of them. To the chamber of Wetzlar, his quota is 811 rix-dollars, 58 kruitzers, each term. As to the orders of the knights of the Black Eagle, and of Merit, it is sufficient here to observe, that the former was instituted by Frederic I. at his coronation, and the other by the present king. For the government of this country and the administration of justice, there are several supreme colleges and tribunals; particularly for the departments of war, foreign affairs, and the finances, there are distinct boards. Here is a supreme ecclesiastical council and consistory for the Lutherans; a supreme directory of the Calvinist church; a supreme medicinal college; a supreme mine-office; a college or board of trade, &c. Those of the French nation, settled in this country, are allowed particular courts of their own. The amount of the yearly revenues of the Mark, arising from the domains, protection-money paid by the Jews, tolls, land-tax, mines, foreells, duties on stamp-paper, salt, and variety of other imposts and excises, is computed at about 2,500,000 crowns; but the money is said to be much inferior in goodness to that of Saxony and the dominions of Hanover. During the late continental war it was extremely debased. Some estimate the whole number of the inhabitants of the royal and electoral dominions at 5,000,000, and the revenues at about 2,000,000 sterling. Upwards of 100,000 men are kept on foot in time of peace, which are said to cost more than half of the royal revenue. These troops are under strict discipline, very expert at their exercise, always in readiness to march, and always complete. Each regiment has a particular canton or district allotted it for its quarters and raising recruits. The infantry are clothed in blue, and the horse and dragons in white; and both are required to hear sermon twice a-day when in quarters or garrisons. In time of peace they are allowed, for several months in the year, to hire themselves out, or to follow their business either as burghers or peasants, in the canton where they are quartered; but they are not allowed to marry. A considerable part of these troops are stationed in the Mark, particularly at Berlin and Potsdam. The corps of hussars alone amounts to about 10,000 men. The Mark of Brandenburg is divided, in general, into the electoral and new Marks. The former is again subdivided into the old Mark, the Pregnitz, the middle Mark, and the Ucker Mark. The old Mark, which lies on the west side of the Elbe, between that river and Lunenburg, is about 50 miles in length, and 30 in breadth.

BRANDENBURG, a city of Germany, and capital of the marquisate of that name, situated on the river Havel, in E. Long. 13. N. Lat. 52. 25. It is divided into the old and new town, and was anciently the see of a bishop. The mountain in the neighbourhood called *Marienbergh*, is planted with vines. Here is a small colony of French Calvinists, with a manufacture of cloth, fustian, and canvas; and a pretty good trade is carried on by the Havel. The fort here looks like a suburb, and contains a riding-school, with the cathedral church. The greatest part also of the members of the chapter which still subsists, and is composed of a Lutheran provost, dean, senior, sub-senior, and three other canons, reside in it. They are distinguished by a cross of gold enamelled with violet, terminating in eight points; and have a considerable estate. Near the town is a large lake.

BRANDEUM, in ecclesiastical writers, a linen cloth or veil put over the tombs of the apostles St Peter and St Paul, and left there for some time; by which it is supposed to acquire a degree of sanctity, so as to be worshipped as a relic; and for that purpose frequently sent by the pope as a present to some prince. In this sense, Brandeum amounts to the same with what was otherwise called *sanctuarium*, *fularium*, *orarium*, and *velum*. The use of brandea was introduced as a means of diffusing and propagating the virtues and influences of relics, without moving, or any way impairing, the substance of them; the translation of relics in early days being forbidden.

BRANDING, in the face or hand, denotes a punishment inflicted by law on various offences, by burning with a hot iron, after the offender hath been once admitted to benefit of clergy.

BRANDON, a town of Suffolk in England, seated on a little river Ouse, over which it has a bridge, and a ferry at a mile's distance: whence it is divided into Brandon, and Brandon-ferry; which last has the most business, because commodities are brought thither from the isle of Ely. This place gives the British title of duke to the family of Hamilton in Scotland. E. Long. 0. 55. N. Lat. 52. 30.

BRANDRILL, denotes a trevet or other iron stand, whereon to set a vessel over the fire.

BRANDRITH, among builders, denotes a fence or rail about the mouth of a well.

BRANDY (Gerard), a learned divine of the reformed religion, was born at Amsterdam in 1626, and was successively minister in several places of the Netherlands. He wrote some works which are esteemed, particularly *The History of the reformation of the Netherlands*, 4 vols. 4to; and *The life of admiral Ruyter*; both written in the Flemish tongue. He died at Rotterdam in 1685.

BRANDY, a spirituous and inflammable liquor, extracted from wine and other liquors by distillation. See DISTILLATION.

Wine-brandy, made in France, is esteemed the best in Europe. They make it wherever they make wine, and for that purpose use wine that is pricked rather than good wine. The chief brandies for foreign trade, and those accounted best, are the brandies of Bourdeaux, Rochelle, Cogniac, Charenton, the isle of Rhe, Orleans, the county of Blaisois, Poictou, Touraine, Anjou, Nantz, Burgundy, and Champaign.

Brank
||
BraP.

BRANK, an instrument used in some parts of Scotland, and in Staffordshire, for correcting scolding women. It is a sort of head-piece, which opens and incloses the head of the impatient, while an iron, sharp as a chisel, enters the mouth, and subdues the more dreadful weapon within. Thus harnessed, the offender is led in triumph through the streets. Dr Platt, in his History of Staffordshire, has favoured the world with a minute description and figure of the instrument †, which is there called a *scolding-bridle*; and tells us, he looks upon it "as much to be preferred to the ducking-stool, which not only endangers the health of the party, but also gives the tongue liberty betwixt every dip; to neither of which this is at all liable."

† P. 379.
Tab xxvii.

BRANLIN, in ichthyology, a species of salmon, with several transverse black streaks, resembling the impression of so many fingers.

BRANNODUNUM (Notitia), with a garrison of the Equites Dalmatæ; a town of Britain, on the Sinus Metaris: now Brancester, in Norfolk, on the Washes.

BRANOGENIUM, or BRANIUM, a town of the Coritani, a people in the heart of Britain: from the distances of the Itinerary, Camden supposes it to be Worcester.

BRANSKA, a town of Transylvania, situated on the river Marih. E. Long. 23. 15. N. Lat. 46. 0.

BRASIDAS, a celebrated general of the Lacedæmonians, about 424 years before the birth of Christ. He defeated the Athenians by land and sea, took many places, and rendered his country formidable to all the neighbouring states. He conquered the Athenians on their attempting to surprise Amphipolis, but died of the wounds he received in that battle. See ATTICA and LACÆDEMON.

BRASIDA, an anniversary solemnity at Sparta, in memory of Brasidas, a Lacedæmonian captain, famous for his achievements at Methone, Pylos, and Amphipolis. It was celebrated with sacrifices and games, wherein none were permitted to contend but free-born Spartans. Whoever neglected to be present at the solemnity was fined.

BRASIL, a large country of South America, being the easternmost part of that continent, lying between the equinoctial line and the tropic of Capricorn. It is about 1560 miles in length, and 1000 in breadth; but, measuring along the coast, it is 2000 miles long, and is bordered with mountains that open from time to time, and form good harbours where vessels may lie in safety. It was accidentally discovered by the Portuguese in 1500. Emanuel king of Portugal had equipped a squadron of 13 sail, carrying 1200 soldiers and sailors destined for the East Indies, under the conduct of Peter Alvarez Cabral. This admiral, quitting Lisbon on the 9th of March 1500, struck out to sea to avoid the coast of Guinea, and steered his course southward, that he might the more easily turn the Cape of Good Hope, which projects a good way into the ocean. On the 24th of April, he got sight of the continent of South America, which he judged to be a large island at some distance from the coast of Africa. Coasting along for some time, he ventured to send a boat on shore; and was astonished to observe the inhabitants entirely different from the Africans in features, hair, and complexion. It was found, however, impracticable to seize upon any of the Indians, who retired

with great celerity to the mountains on the approach of the Portuguese; yet, as the sailors had discovered a good harbour, the admiral thought proper to come to an anchor, and called the bay *Puertos Seguros*. Next day he sent another boat on shore, and had the good fortune to lay hold on two of the natives, whom he clothed and treated kindly, and then dismissed, to make a proper report to their countrymen. The stratagem had the desired effect. The Indians, having heard the relation of the prisoners, immediately crowded to the shore, singing, dancing, and sounding horns of different kinds; which induced Cabral to land, and take solemn possession in the name of his Portuguese majesty.

As soon as the court of Lisbon had ordered a survey to be taken of the harbours, bays, rivers, and coasts of Brasil, and was convinced that the country afforded neither gold nor silver, they held it in such contempt, that they sent thither none but condemned criminals and abandoned women. Two ships were sent every year from Portugal, to carry the refuse of the kingdom to this new world, and to bring home parrots and woods for the dyers and cabinet-makers. Ginger was afterwards added; but soon after prohibited, lest it should interfere with the sale of the same article from India.

In 1548, the Jews, many of whom had taken refuge in Portugal, beginning to be persecuted by the inquisition, were stripped of their possessions, and banished to Brasil. Here, however, they were not entirely forsaken. Many of them found kind relations and faithful friends; others, who were known to be men of probity and understanding, obtained money in advance from merchants of different nations with whom they had formerly had transactions. By the assistance of some enterprising men, they were enabled to cultivate sugar-canes, which they first procured from the island of Madeira. Sugar, which till then had been used only in medicine, became an article of luxury. Princes and great men were all eager to procure themselves this new species of indulgence. This circumstance proved favourable to Brasil, and enabled it to extend its sugar plantations. The court of Lisbon, notwithstanding its prejudices, began to be sensible, that a colony might be beneficial to the mother-country, without producing gold or silver; and this settlement, which had been wholly left to the capricious management of the colonists, was now thought to deserve some kind of attention; and accordingly Thomas de Souza was sent thither, in 1549, to regulate and superintend it.

This able governor began by reducing these men, who had always lived in a state of anarchy, into proper subordination, and bringing their scattered plantations closer together; after which he applied himself to acquire some information respecting the natives, with whom he knew he must be incessantly engaged either in traffic or war. This it was no easy matter to accomplish. Brasil was full of small nations, some of which inhabited the forests, and others lived in the plains and along the rivers. Some had settled habitations; but the greater number of them led a roving life, and most of them had no intercourse with each other. It is not to be supposed that such a people would be at all disposed to submit to the yoke which the Portuguese wanted to put upon them on their arrival. At first they only declined all intercourse with these strangers: but finding themselves pursued in order

Brasil.

to be made slaves, and to be employed in the labours of the field, they took the resolution to murder and devour all the Europeans they could seize upon. The friends and relations of the savages that were taken prisoners, also ventured to make frequent attempts to rescue them, and were sometimes successful; so that the Portuguese were forced to attend to the double employments of labour and war.

Souza did not bring a sufficient number of forces to change the situation of affairs. Indeed, by building San Salvador, he gave a centre to the colony; but the honour of settling, extending, and making it really useful to the mother-country, was reserved for the Jesuits who attended him. These men, who for their arts of insinuation and address have been equalled by none, dispersed themselves among the Indians. When any of the missionaries were murdered, they were immediately replaced by others; and seeming to be inspired only with sentiments of peace and charity, the Indians, in process of time, grew not only familiar but passionately fond of them. As the missionaries were too few in number to transact all the business themselves, they frequently deputed some of the most intelligent Indians in their stead. These men having distributed hatchets, knives, and looking-glasses, among the savages they met with, represented the Portuguese as a harmless, humane, and good sort of people.

The prosperity of the colony of Brasil, which was visible to all Europe, excited the envy of the French, Spaniards, and Dutch successively. The latter, indeed, bid fairest for the conquest of the whole. Their admiral Henry Louk arrived, in the beginning of the year 1630, with 46 men of war, on the coast of Pernambuco, one of the largest and best fortified captainships of these parts. He reduced it after several obstinate engagements, in which he was always victorious. The troops he left behind subdued the captainships of Temaraca, Paricou, and Rio Grande, in the years 1633, 1634, and 1635. These, as well as Pernambuco, furnished annually a large quantity of sugar, a great deal of wood for dyeing, and other commodities. The Hollanders were so elated with the acquisition of this wealth, which flowed to Amsterdam instead of Lisbon, that they determined to conquer all the Brasils, and entrusted Maurice of Nassau with the conduct of this enterprize. That general reached the place of his destination in the beginning of the year 1637. He found the soldiers so well disciplined, the commanders such experienced men, and so much readines, in all to engage, that he directly took the field. He was successively opposed by Albuquerque, Batjola, Lewis Rocca de Gorgia, and the Brazilian Cameron, the idol of his people, passionately fond of the Portuguese, brave, active, cunning, and who wanted no qualification necessary for a general, but to have learned the art of war under able commanders. These several chiefs exerted their utmost efforts to defend the possessions that were under their protection; but their endeavours proved ineffectual. The Dutch seized upon the captainships of Siara, Serregippe, and the greater part of that of Bahia. Seven of the 15 provinces which composed the colony had already submitted to them, and they flattered themselves that one or two campaigns would make them masters of the rest of their enemies' possessions in that part of America; when they were suddenly checked by the

revolution happening on the banishment of Philip IV. and placing the Duke of Braganza on the throne. After this, the Portuguese recovering their spirits, soon drove the Dutch out of Brasil, and have continued masters of it ever since.

The country of Brasil is divided into the following provinces, viz. Paria, Maragnano, Siara, Rio Grande, Paricou, Tamarica, Pernambuco, Serregippe, Bahia, Porto Seguro, Esperito Santo, Rio de Janeiro, Angola, St Vincent, and Del Rey. See these articles.

The first aspect of the country from the sea is rather unfavourable, as it appears high, rough, and unequal; but, on a more narrow inspection, nothing can be more delightful, the eminences being covered with woods, and the valleys and savannahs with the most refreshing verdure. In so vast a tract of land, it cannot be imagined that the climate will be found at all equal, or the seasons uniform. The northern provinces are subject to heavy rains and variable winds, like other countries under the same parallels. Tornados, storms, and the utmost fury of the elements, wreak their vengeance here; while the southerly regions are blessed with all the comforts which a fine fertile soil and temperate climate can afford. In some of the provinces, the heat of the climate is thought to prove favourable to the generation of a great variety of poisonous reptiles; some of which, as the *Libya*, or *racub* snake, are said to extend to the length of 30 feet, and to be two or three yards in circumference. The rattlesnake, and other reptiles of the same kind, grow likewise to an enormous size; and the serpent called *iniboloka* is affirmed to be seven yards long, and half a yard in circumference, possessed too of a poison instantaneously fatal to the human race. Here also are scorpions, ant bears, tygers or maddilloes, porcupines, jaguwers, and an animal called *tapirayor*, which is the production of a bull and an ass, having a great resemblance to both. No country on earth affords a greater number of beautiful birds, nor variety of the most exquisite fruits; but the chief commodities are Brasil-wood, ebony, dyeing woods, ambergris, rosin, balsams, indigo, sweetmeats, sugar, tobacco, gold, diamond, beautiful pebbles, crystal, emerald, jasper, and other precious stones; in all which the Portuguese carry on such an amazing trade, as may justly be reputed the support, and indeed the vital fountain, of the mother-country. The gold and diamond mines are but a recent discovery: they were first opened in the year 1684; and have since yielded above five millions sterling annually, of which sum a fifth belongs to the crown. So plentiful are diamonds in this country, that the court of Portugal hath found it necessary to restrain their importation, to prevent too great a diminution of their value. They are neither so hard nor so clear as those of the East Indies, nor do they sparkle so much, but they are whiter. The Brazilian diamonds are sold ten per cent. cheaper than the Oriental ones, supposing the weights to be equal. The largest diamond in the world was sent from Brasil to the king of Portugal. It weighs 1685 carats, or 12½ ounces; and has been valued at £56,787,500. Some skilful lapidaries, however, are of opinion that this supposed diamond is only a topaz; in which case a very great abatement must be made in its value. The crown-revenue arising from the colony amounts to two millions sterling in gold. It may credit some late writers, besides the diamonds,

Brasil
||
Brass.

customs on merchandise imported from that quarter. This indeed is more than a fifth of the precious metal produced by the mines; but, every other consequent advantage considered, it probably does not much exceed the truth. The excessive confluence of people to the Brasil colonies, as well from other countries as from Portugal, not only enlarges the imports of gold, but, what is of infinitely more importance to Europe in general, the exportation of the manufactures of this hemisphere; of which the principal are the following. Great Britain sends woollen manufactures; such as fine broad medley cloths, fine Spanish cloths, scarlet and black cloths; serges, duroys, druggets, sagathies, shalloons, camblets, and Norwich stuffs: black Colchester bays; tays, and perpetuanas called *Long ells*; hats, stockings, and gloves. Holland, Germany, and France, chiefly export fine hollands, bone-lace, and fine thread: silk manufactures, pepper, lead, block tin, and other articles, are also sent from different countries. Besides the particulars already specified, England likewise trades with Portugal, for the use of the Brasils, in copper and brass, wrought and unwrought pewter, and all kinds of hardware: all which articles have so enlarged the Portuguese trade, that, instead of 12 ships usually employed in the Brasil commerce, there are now never fewer than 100 sail of large vessels constantly going and returning to those colonies. To all this may be added the vast slave-trade carried on with the coast of Africa for the use of the Brasil colonies: which, we may believe, employs a great number of shipping, from the multitude of slaves that are annually transported. Indeed the commerce of Brasil alone is sufficient to raise Portugal to a considerable height of naval power, as it maintains a constant nursery of seamen: yet a certain infatuation in the policy of the country has prevented that effect even amidst all these extraordinary advantages. All the ships in this trade, being under the direction of the government, have their appointed seasons of going and returning, under convoy of a certain number of men of war: nor can a single ship clear out or go, except with the fleet, but by a special licence from the king, which is seldom granted; though it is easily determined, that such restrictions can prove no way beneficial to the general commerce, though possibly the crown-revenue may be better guarded thereby. The fleets sail in the following order, and at the following stated periods: That to Rio de Janeiro sets sail in January; the fleet to Bahia, or the bay of All Saints, in February; and the third fleet, to Fernambucca, in the month of March.

BRASIL-Wood, or *Brazil-wood*, an American wood of a red colour, and very heavy. It is denominated variously, according to the places from whence it is brought: Thus we have brasil of Fernambucca, Japan, Lamou, &c. For its description, &c. see *CASALPINA*.

BRASILETTO, the same with Brasil-wood.

BRASLAW, a considerable town of Poland, in Lithuania, and palatinate of Wilna, with a castle. It is seated on a small lake, in E. Long. 17. 5. N. Lat. 55. 45.

BRASS, or, as the French call it, *yellow copper*, is a scititious metal, made of copper and zinc, or lapis calaminaris. See *CHEMISTRY-Index*.

The first formation of brass, as we are assured by scripture, was prior to the flood, and discovered even

in the seventh generation from Adam†. But the use of it was not, as is generally believed, and the Arundelian marbles assert, previous to the knowledge of iron. They were both first known in the same generation, and first wrought by the same discoverer. And the knowledge of them must have been equally carried over the world afterwards, with the spreading of the colonies of the Noachidæ. An acquaintance with the one or the other was absolutely necessary to the existence of the colonists; the clearing away of the woods about their settlements, and the erection of houses for their habitation.

The ancient Britons, though acquainted from the remotest periods with the use of both these metals, remained long ignorant that they were to be obtained in the island. Before this discovery they imported all their iron and brass from the continent. And when they had at length detected the former in their own hills, and had ceased to introduce it, they continued to receive the latter. Their want of the metal remained, and no mines of it were opened in the island. In the earliest ages, whose manners have been delineated by history, we find the weapons of their warriors invariably framed of this scititious metal; and the most authentic of all the profane records of antiquity, the Arundelian marbles, for that reason, mistakenly date the first discovery of iron a couple of centuries below the Trojan war. Every military nation, as such, is naturally studious of brightness in its arms; and the Britons, particularly, gloried in the neatness of theirs. For this reason the nations of the world still fabricated their arms of brass, even long after the Arundelian æra for the discovery of iron; and the Britons continued to import it from the continent, though they had found iron to be a native of the country, and could have supplied themselves with a sufficient quantity of it.

Mr Whitaker† supposes, that when the Britons derived their iron and brass from the continent, they purchased the latter at an easier expence than the former. The Gauls had many large brass works carried on in the kingdom, but seem to have had few iron forges within it. And this would naturally induce the Belgæ to be less diligent in their inquiry after the veins of copper and calamine at home, than for the courses of iron ore; though the one was equally discoverable in the island as the other, and lay equally within the Belgic regions of it. Brass being thus cheaper than iron, they necessarily formed with it some domestic as well as military implements. Such were common among the Gauls; and such were familiar to the Britons, either imported into the island, as some actually were, or manufactured within it, as others also assuredly were. The Britons had certainly brass founderies erected among them, and minted money, and fabricated weapons of brass.

In this condition of the works, the Romans entered the island. And seeing so great a demand among the natives for this article, they would speedily instruct them to discover the materials of it among themselves. This must unavoidably have resulted from the conquest of the Romans. The power of surprising their new subjects with so unexpected a discovery would naturally stimulate the pride of the Roman intellect; and the desire of obliging themselves with so cheap a supply of that useful metal, stationary as they were in that kingdom, would also equally actuate the selfishness of the

Brass.
Gen. iv.

† Hist. of Manchester

the Roman heart. The veins of copper and calamine would be easily found out by an experienced inquirer after them; and the former metal is therefore distinguished among the Welsh, only by the Roman appellation of *cyprian*, *kopp* or copper. And many founderies of brass appear to have been established in the island. Some had been erected before, one perhaps within the confines of every kingdom, and probably in the vicinity of every capital. One at least would be necessary, in order to supply the armoury of the principality: and one perhaps was sufficient for most of the British states. But several appear now to have been settled in every kingdom, and one perhaps near every stationary town. Two have been discovered in the single county of Essex, and within a narrow portion of it at Fildes and Dunbury. And a third was placed upon Easlerly Moor in Yorkshire, 12 miles to the north-west of York, and in the neighbourhood of Ilurium or Aldborough.

Corinthian Brass, famous in antiquity, is a mixture of gold, silver, and copper. L. Mummius having sacked and burnt the city of Corinth, 146 years before Christ, it is said this metal was formed from the immense quantities of gold, silver, and copper, wherewith that city abounded, thus melted and run together by the violence of the conflagration.

BRASS, in the glass trade.—Thrice-calcined brass is a preparation which serves the glassmen to give many very beautiful colours to their metal. The manner of preparing it is this: Place thin plates of brass on tiles on the leet of the furnace near the oebis; let it stand to be calcined there for four days, and it will become a black powder sticking together in lumps. Powder this, sift it fine, and recalcine it four or five days more; it will not then stick together, but remain a loose powder, of a russet colour. This is to be calcined a third time in the same manner; but great care must be taken in the third calcination, that it be not overdone nor underdone; the way to be certain when it is right is, to try it several times in glass while melting. If it makes it, when well purified, to swell, boil, and rise, it is properly calcined; if not, it requires longer time. This makes, according to the different proportions in which it is used, a sea-green, an emerald-green, or a turcoise colour.

Brass, by long calcination alone, and without any mixture, affords a fine blue or green colour for glass; but they have a method of calcining it also with powdered blinestone, so as to make it afford a red, a yellow, or a chalcidony colour, according to the quantity and other variations in the using it. The method of making the calcination is this: Cut thin plates of brass into small pieces with sheers, and lay them stratum super stratum, with alternate beds of powdered sulphur, in a crucible; calcine this for 24 hours in a strong fire; then powder and sift the whole; and finally, expose this powder upon tiles for 12 days to a reverberating furnace; at the end of this time, powder it fine, and keep it for use. The glass makers have also a method of procuring a red powder from brass, by a more simple calcination, which serves them for many colours. The method of preparing it is this: They put small and thin plates of brass into the arches of the glass furnaces, and leave them there till they are sufficiently calcined, which the heat in that place, not being enough to melt

them, does in great perfection. The calcined matter powdered, is of a dusky red, and requires no farther preparation.

Brass-Colour, one prepared by the braziers and colour-men to imitate brass. There are two sorts of it; the red brass or bronze, and the yellow or gilt brass; the latter is made only of copper-slings, the smallest and brightest that can be found; with the former they mix some red ochre, finely pulverized; they are both used with varnish.—In order to make a fine brass that will not take any rust or verdigris, it must be dried with a chafing-dish of coals as soon as it is applied.—The finest brass-colour is made with powder brass imported from Germany, diluted into a varnish, made and used after the following manner: The varnish is composed of one pound four ounces of spirit of wine, two ounces of gum-lac, and two ounces of sandarac; these two last drugs are pulverized separately, and afterwards put to dissolve in spirit of wine, taking care to fill the bottle but half full. The varnish being made, you mix such quantity as you please of it with the pulverized brass, and apply it with a small brush to what you would brass over. But you must not mix too much at once, because the varnish being very apt to dry, you would not have time to employ it all soon enough; it is therefore better to make the mixture at several times. After this manner they brass over figures of plaster, which look as well as if they were of cast brass.

Brass-Leaf is made of copper, beates out into very thin plates, and afterwards rendered yellow. The German artists, particularly those of Nuremberg and Augsburg, are said to possess the best method of giving to these thin plates of copper a fine yellow colour like gold, by simply exposing them to the fumes of zinc, without any real mixture of it with the metal. These plates are cut into little pieces, and then beaten out fine like leaves of gold; after which they are put into books of coarse paper, and sold at a low price for the vulgar kinds of gilding. The parings or shreds of these very thin yellow leaves being well ground on a marble plate, are reduced to a powder similar to gold; which serves to cover, by means of gum-water or some other glutinous fluid, the surface of various mouldings or pieces of curious workmanship, giving them the appearance of real bronze, and even of fine gold, at a very trifling expence, because the gold colour of this metallic powder may be easily raised and improved by stirring it on a wide earthen basin over a slow fire.

Brass-Lumps, a common name given by miners to the globular pyrites. See PYRITES.

BRASSAW, or **CROSSFAD**, a strong town of Transylvania in Burezland; seated on the river Baxel, in L. Long. 22. 35. N. Lat. 46. 30.

BRASSE, in ichthyology, a species of PERCA.

BRASSICA, **CABBAGE**: A genus of the siliquosa order, belonging to the tetradynamia class of plants; and in the natural method ranking under the 39th order, *Siliqua fo.* The calyx is erect and converging; the feed are globular; the gland between the shorter stamina and the pistillum, and between the longer ones and the calyx. There are 12 species. 1. The oleracea, with heart-shaped smooth leaves embracing the stem, and four-cornered capsules. 2. The campestris, with a slender root and stem, the leaves being uniform, heart-shaped, and sessile. 3. The arvensis, with scalloped

Bras
||
Brassica.

Brassica.

leaves embracing the stem; the highest heart-shaped, and most entire. 4. The alpina, with the radical leaves egg-shaped, and erect petals. 5. The napus, with the root-stem spindle shaped. 6. The rassa, with the radical stem growing orbicular, depressed, and fleshy. 7. The oleracea, with the radical stem growing columnar and fleshy. 8. The chinensis, with very entire oval leaves; the floral leaves lanceolated and embracing the stem; the calyxes longer than the claw of the petals. 9. The violacea, with lanceolated, egg-shaped, smooth, undivided, and dentated.

In these species the style is obtuse; in the following coniform. 10. The crucialtrum, with runcinate leaves, a hispid stem, and polished capsules. 11. The crucea, with lyrated leaves, shaggy stem, and smooth capsules. 12. The vesicaria, with runcinate leaves, and hispid capsules covered with a tumid calyx.

Culture, &c. The second sort never varies. It grows naturally on the sea-shore near Dover. It hath a perennial branching stalk, in which it differs from all the other species. In very severe winters, when the other sorts are destroyed, this is a necessary plant, for the most severe frosts do not injure it. The flower-stalks grow from the end of the branches, and spread out horizontally; but those which arise from the centre of the plants grow erect, and seldom put out branches. The cauliflower has been much more improved in Britain than in any other part of Europe. In France they rarely have cauliflowers till Michaelmas, and Holland is generally supplied with them from Britain. In many parts of Germany there were none of them cultivated till within a few years past, and most parts of Europe are supplied with seeds from Britain. The eighth sort, which is generally known by the title of *rape* or *cole seed*, is much cultivated in the isle of Ely, and some other parts of England, for its seed, from which rapeseed oil is drawn; and it hath also been cultivated of late years, in other places, for feeding of cattle, to great advantage. The cole seed, when cultivated for feeding of cattle, should be sown about the middle of June. The ground for this should be prepared for it in the same manner as for turnips. The quantity of seeds for an acre of land is from six to eight pounds; and as the price of the seed is not great, so it is better to allow eight pounds; for if the plants are too close in any part, they may be easily thinned when the ground is hoed, which must be performed in the same manner as is practised for turnips, with this difference only, of leaving these much nearer together; for as they have fibrous roots and slender stalks, so they do not require near so much room. These plants should have a second hoeing about five or six weeks after the first, which, if well performed in dry weather, will entirely destroy the weeds, so they will require no farther culture. Where there is not an immediate want of food, these plants had better be kept as a reserve for hard weather, or spring seed, when there may be a scarcity of other green food. If the heads are cut off, and the stalks left in the ground, they will shoot again early in the spring, and produce a good second crop in April; which may be either fed off, or permitted to run to seeds, as is the practice where this is cultivated for the seeds: but if the first is fed down, there should be care taken that the cattle do not destroy their stems, or pull them out of the ground. As this plant is so hardy as not to be de-

stroyed by frost, so it is of great service in hard winters for feeding of ewes; for when the ground is so hard frozen as that turnips cannot be taken up, these plants may be cut off for a constant supply. This will afford late food after the turnips are run to seed; and if it is afterwards permitted to stand for seed, one acre will produce as much as, at a moderate computation, will sell for five pounds, clear of charges. Partridges, pheasants, turkeys, and most other fowl, are very fond of this plant; so that wherever it is cultivated, if there are any birds in the neighbourhood, they will constantly lie among these plants. The seeds of this plant are sown in gardens for winter and spring fallads, this being one of the small fallad herbs.

The common white, red, flat, and long-sided cabbages are chiefly cultivated for autumn and winter use; the seeds of these sorts must be sown the beginning or middle of April, in beds of good fresh earth; and when the young plants have about eight leaves, they should be pricked out into shady borders, about three or four inches square, that they may acquire strength, and to prevent their growing long shanked. About the middle of June you must transplant them out, where they are to remain. If they are planted for a full crop in a clear spot of ground, the distance from row to row should be three feet and a half, and in the rows two feet and a half asunder: if the season should prove dry when they are transplanted out, you must water them every other evening until they have taken fresh root; and afterwards, as the plants advance in height, you should draw the earth about their stems with a hoe, which will keep the earth moist about their roots, and greatly strengthen the plants. These cabbages will some of them be fit for use soon after Michaelmas, and will continue until the end of February, if they are not destroyed by bad weather; to prevent which, the gardeners near London pull up their cabbages in November, and trench their ground up in ridges, laying their cabbages against their ridges as close as possible on one side, burying their stems in the ground: in this manner they let them remain till after Christmas, when they cut them for the market; and although the outer part of the cabbage be decayed (as is often the case in very wet or hard winters), yet, if the cabbages were large and hard when laid, the inside will remain sound.

The Russian cabbage was formerly in much greater esteem than at present, it being now only to be found in particular gentlemen's gardens, who cultivate it for their own use. This must be sown late in the spring of the year, and managed as those before directed, with this difference only, that these must be sooner planted out, and must have an open clear spot of ground, and require much less distance every way, for it is but a very small hard cabbage. This sort will not continue long before they will break and run up to feed.

The early and sugar-loaf cabbages are commonly sown for summer use, and are what the gardeners about London commonly call *Michaelmas cabbages*. The season for sowing of these is about the end of July, or beginning of August, in an open spot of ground; and when the plants have got eight leaves, you must prick them into beds at about three or four inches distance every way, that the plants may grow strong and short shanked; and toward the end of October you should plant them out: the distance that these require is, three feet

Brassica.

feet row from row, and two feet and a half asunder in the rows. The ground must be kept clean from weeds, and the earth drawn up about your cabbage plants. In May, if your plants were of the early kind, they will turn in their leaves for cabbaging; at which time, the gardeners near London, in order to obtain them a little sooner, tie in their leaves close with a slender stick or twig to blanch their middle; by which means, they have them at least a fortnight sooner than they could have if they were left untied.

The early cabbage being the first, we should choose to plant the fewer of them, and a greater quantity of the sugar-loaf kind, which comes after them; for the early kind will not supply the kitchen long, generally cabbaging apace when they begin, and as soon grow hard and burst open; but the sugar-loaf kind is longer before it comes, and is as slow in its cabbaging; and being of an hollow kind, will continue for a good long time. The sugar-loaf kind may be planted out in February, and will succeed as well as if planted earlier; with this difference only, that they will be later before they cabbage. You should also reserve some plants of the early kind in some well-sheltered spot of ground, to supply your plantation, in case of a defect; for in mild winters many of the plants are apt to run to seed, especially when their seeds are sown too early, and in severe winters they are often destroyed.

The Savoy cabbages are propagated for winter use, as being generally esteemed the better when pinched by the frost: these must be sown about the end of April, and treated after the manner as was directed for the common white cabbage; with this difference, that these may be planted at a closer distance than those; two feet and a half square will be sufficient. These are always much better when planted in an open situation, which is clear from trees and hedges; for in close places they are very subject to be eaten almost up by caterpillars and other vermin, especially if the autumn prove dry.

The broccoli may also be treated in the same manner, but need not be planted above one foot asunder in the rows, and the rows two feet distance; these are never eaten till the frost hath rendered them tender; for otherwise they are tough and bitter.

The seeds of the broccoli (of which there are several kinds, viz. the Roman or purple, the Neapolitan or white, and the black broccoli, with some others, but the Roman is preferred to them all), should be sown about the latter end of May, or beginning of June, and when the plants are grown to have eight leaves, transplant them into beds (as was directed for the common cabbage); and toward the latter end of July they will be fit to plant out, which should be done into some well-sheltered spot of ground, but not under the drip of trees: the distance these require is about a foot and a half in the rows, and two feet row from row. The soil in which they should be planted ought to be rather light than heavy: if your plants succeed well (as there will be little reason to doubt, unless the winter prove extremely hard), they will begin to show their small heads, which are somewhat like a cauliflower, but of a purple colour, about the end of December, and will continue eatable till the middle of April. The brown or black broccoli is by many persons greatly esteemed, though it doth not deserve a place in the kitchen-garden where the Roman broccoli can be obtained, which is much

sweeter, and will continue longer in season: indeed, the brown sort is much hardier, so that it will thrive in the coldest situations, where the Roman broccoli is sometimes destroyed in very hard winters. The brown sort should be sown in the middle of May, and managed as hath been directed for the common cabbage, and should be planted at the same distance, which is about two feet and a half asunder. This will grow very tall, so should have the earth drawn up to their stems as they advance in height. This doth not form heads so perfect as the Roman broccoli; the stems and hearts of the plants are the parts which are eaten. The Roman broccoli (if well managed) will have large heads, which appear in the centre of the plants like clusters of buds. These heads should be cut before they run up to seed, with about four or five inches of the stem; the skin of these stems should be stripped off before they are boiled. After the first heads are cut off, there will be a great number of side-shoots produced from the stems, which will have small heads to them, but are full as well flavoured as the large. The Naples broccoli hath white heads very like those of the cauliflower, and eats so like it as not to be distinguished from it. — Besides this first crop of broccoli (which is usually sown in the end of May), it will be proper to sow another crop the beginning of July, which will come in to supply the table the latter end of March and the beginning of April; and being very young, will be extremely tender and sweet.

In order to save good seeds of this kind of broccoli, you should reserve a few of the largest heads of the first crop, which should be let remain to run up to seed, and all the under shoots should be constantly stripped off, leaving only the main stem to flower and seed. If this be duly observed, and no other sort of cabbage permitted to seed near them, the seeds will be as good as those procured from abroad, and the sort may be preserved in perfection many years.

The turnip-rooted cabbage was formerly more cultivated in Britain than at present; for since other sorts have been introduced which are much better flavoured, this sort has been neglected. There are some persons who esteem this kind for soups, but it is too strong for most palates; and is seldom good but in hard winters, which will render it tender and less strong. At the end of June the plants should be transplanted out where they are to remain, allowing them two feet distance every way, observing to water them until they have taken root; and as their stems advance, the earth should be drawn up to them with a hoe, which will preserve a moisture about their roots, and prevent their stems from drying and growing woody, so that the plants will grow more freely; but it should not be drawn very high, for as it is the globular part of the stalk which is eaten, so that should not be covered. In winter they will be fit for use, when they should be cut off, and the stalks pulled out of the ground and thrown away, being good for nothing after the stems are cut off. As food for cattle, however, the cultivation of this species deserves particular attention. See AGRICULTURE, n^o 170.

The curled colewort or Siberian broccoli is now more generally esteemed than the former, being extremely hardy, so is never injured by cold, but is always sweeter in severe winters than in mild seasons. This

Brafica.

may be propagated by fowing of the feeds the beginning of July; and when the plants are strong enough for transplanting, they should be planted in rows about a foot and a half asunder, and ten inches distance in the rows. These will be fit for use after Christmas, and continue good until April, so that they are very useful in a family.

The milk cabbage. This may be propagated in the same manner as the common cabbage, and should be allowed the same distance: it will be fit for use in October, November, and December; but, if the winter proves hard, these will be destroyed much sooner than the common sort.

The common colewort or Dorsetshire kale, is now almost lost near London, where their markets are usually supplied with cabbage plants instead of them. The best method to cultivate this plant in the fields is, to sow the seeds about the beginning of July, choosing a moist season, which will bring up the plants in about ten days or a fortnight; the quantity of seed for an acre of land is nine pounds: when the plants have got five or six leaves they should be hoed, as is practised for turnips, cutting down all the weeds from amongst the plants, and also thinning the plants where they are too thick; but they should be kept thicker than turnips, because they are more in danger of being destroyed by the fly: this work should be performed in dry weather, that the weeds may be killed. About six weeks after the plants should have a second hoeing, which, if carefully performed in dry weather, will entirely destroy the weeds, and make the ground clean, so that they will require no farther culture: in the spring they may be either drawn up and carried out to feed the cattle, or they may be turned in to feed upon them as they stand; but the former method is to be preferred, because there will be little waste; whereas, when the cattle are turned in amongst the plants, they will tread down and destroy more than they eat, especially if they are not fenced off by hurdles.

The two last sorts of cabbages are varieties fit for a botanic garden, but are plants of no use. They are annual plants, and perish when they have perfected their seeds.

The best method to save the seeds of all the sorts of cabbages is, about the end of November you should make choice of some of your best cabbages, which you should pull up, and carry to some shed or other covered place, where you should hang them up for three or four days by their stalks, that the water may drain from between their leaves; then plant them in some border near a hedge or pale, quite down to the middle of the cabbage, leaving only the upper part of the cabbage above ground, observing to raise the earth above it, so that it may stand a little above the level of the ground; especially if the ground is wet, they will require to be raised pretty much above the surface. If the winter should prove very hard, you must lay a little straw or pease-haulm lightly upon them, to secure them from the frost, taking it off as often as the weather proves mild, lest by keeping them too close they should rot. In the spring of the year these cabbages will shoot out strongly, and divide into a great number of small branches: you must therefore support their stems, to prevent their being broken off by the wind; and if the weather should be very hot and dry when they are in

flower, you should refresh them with water once a week all over the branches, which will greatly promote their feeding, and preserve them from mildew. When the pods begin to change brown, you will do well to cut off the extreme part of every shoot with the pods, which will strengthen your seeds; for it is generally observed, that those seeds which grow near the top of the shoots, are very subject to run to seed before they cabbage; so that by this there will be no loss, but a great advantage. When your seeds begin to ripen, you must be particularly careful that the birds do not destroy it, for they are very fond of these seeds. The best method to prevent this, is to get a quantity of birdlime, and dawb over a parcel of slender twigs, which should be fastened at each end to stronger sticks, and placed near the upper part of the seed in different places, so that the birds may alight upon them, by which means they will be fastened thereto; where you must let them remain, if they cannot get off themselves: and although there should not above two or three birds be caught, yet it will sufficiently terrify the rest, that they will not come to that place again for a considerable time after.

When your seed is fully ripe, you must cut it off; and after drying, thresh it out, and preserve it in bags for use.

But in planting of cabbages for seed, it will be proper never to plant more than one sort in a place, or near one another: for example, never plant red and white cabbages near each other, nor Savoy with white or red cabbages; for they will, by the commixture of their effluvia, produce a mixture of kinds: and it is said to be owing to this neglect, that the gardeners rarely save any good red cabbage seed in Britain, but are obliged to procure fresh seeds from abroad; as supposing the soil or climate of Britain alters them from red to white, and of a mixed kind betwixt both; whereas, if they should plant red cabbages by themselves for seeds, and not suffer any other to be near them, they might continue the kind as good in Britain as in any other part of the world.

Cauliflowers have of late years been so far improved in Britain, as to exceed in goodness and magnitude what are produced in most parts of Europe, and by the skill of the gardener are continued for several months together; but the most common season for the great crop is in May, June, and July. Having procured a parcel of good seed, you must sow it about the 21st of August, upon an old cucumber or melon-bed, sifting a little earth over the seeds, about a quarter of an inch thick; and if the weather should prove extremely hot and dry, you should shade the beds with mats, to prevent the earth from drying too fast, and give it gentle waterings as you may see occasion. In about a month's time after sowing, your plants will be fit to prick out: you should therefore put some fresh earth upon your cucumber or melon beds; or where these are not to be had, some beds should be made with a little new dung, which should be trodden down close, to prevent the worms from getting through it; but it should not be hot dung, which would be hurtful to the plants at this season, especially if it proves hot; into this bed you should prick your young plants at about two inches square, observing to shade and water them at first planting; but do not water them too much after they are growing,

Brafica.

growing, nor suffer them to receive too much rain if the season should prove wet, which would be apt to make them black shanked, as the gardeners term it, which is no less than a rotteness in their stems, and is the destruction of the plants so affected. In this bed they should continue till about the 30th of October, when they must be removed into the place where they are to remain during the winter season; which, for the first sowing, is commonly under bell or hand glasses, to have early cauliflowers, and these should be of an early kind: but in order to have a succession during the season, you should be provided with another more late kind, which should be sown four or five days after the other, and managed as was directed for them. In order to have very early cauliflowers, you should make choice of a good rich spot of ground that is well defended from the north, east, and west winds, with hedges, pales, or walls; but the first are to be preferred, if made with reeds, because the winds will fall dead in these, and not reverberate as by pales or walls. This ground should be well trenched, burying therein a good quantity of rotten dung; then level your ground, and if it be naturally a wet soil, you should raise it up in beds about two feet and a half, or three feet broad, and four inches above the level of the ground; but if your ground is moderately dry, you need not raise it at all: then plant your plants, allowing about two feet six inches distance from glass to glass in the rows, always putting two good plants under each glass, which may be at about four inches from each other; and if you design them for a full crop, they may be three feet and a half row from row: but if you intend to make ridges for cucumbers between the rows of cauliflower plants (as is generally practised by the gardeners near London), you must then make your rows about eight feet asunder; and the ground between the rows of cauliflowers may be planted with cabbage plants, to be drawn off for coleworts in the spring. When you have planted your plants, if the ground is very dry, you should give them a little water, and then set your glasses over them, which may remain quite close down over them till they have taken root, which will be in about a week or ten days time, unless there should be a kindly shower of rain; in which case you may set off the glasses, that the plants may receive the benefit of it; and in about ten days after planting, you should be provided with a parcel of forked sticks or bricks, with which you should raise your glasses about three or four inches on the side toward the south, that your plants may have free air: in this manner your glasses should remain over the plants night and day, unless in frosty weather, when you should set them down as close as possible; or if the weather should prove very warm, which many times happens in November, and sometimes in December, in this case you should keep your glasses off in the day time, and put them on only in the night, lest, by keeping the glasses over them too much, you should draw them into flower at that season; which is many times the case in mild winters, especially if negligently managed. Toward the latter end of February, if the weather proves mild, you should prepare another good spot of ground to remove some of the plants into from under the glasses, which should be well dunged and trenched (as before): then set off your glasses; and, after making choice of one of the

most promising plants under each glass, which should remain, take away the other plant, by raising it up with a trowel, Sec. 5. as to preserve as much earth to the root as possible; but take care not to disturb or prejudice the roots of the plants which remain. Then plant the plants which you have taken out at the distance before directed, viz. if for a full crop, three feet and a half, row from row; but if for ridges of cucumbers between them, eight feet, and two feet six inches distance in the rows: then, with a small hoe, draw the earth up to the stems of the plants which were left under the glasses, taking great care not to let the earth fall into their hearts; and set your glasses over them again, raising your props an inch or two higher than before, to give them more air, observing to take them off whenever there may be some gentle showers, which will greatly refresh the plants.

In a little time after, if you find your plants grow so fast as to fill the glasses with their leaves, you should then slightly dig about the plants, and raise the ground about them in a bed broad enough for the glasses to stand, about four inches high, which will give your plants a great deal of room, by raising the glasses so much higher when they are set over them; and by this means they might be kept covered until April, which otherwise they could not, without prejudice to the leaves of the plants; and this is a great advantage to them, for many times we have returns of severe frosts at the latter end of March, which prove very hurtful to these plants, if exposed thereto, especially after having been nursed up under glasses.

After you have finished your beds, you may set your glasses over your plants again, observing to raise your props pretty high, especially if the weather be mild, that they may have free air to strengthen them; and in mild soft weather set off your glasses, as also in gentle showers of rain; and now you must begin to harden them by degrees to endure the open air; however, it is advisable to let your glasses remain over them as long as possible, if the nights should be frosty, which will greatly forward your plants; but you must not let your glasses remain upon them in very hot sun-shine, especially if their leaves press against the sides of the glasses; for it hath often been observed in such cases, that the moisture which hath risen from the ground, together with the perspiration of the plants, which by the glasses remaining over them hath been detained upon the leaves of the plants, when the sun hath shone hot upon the sides of the glasses, have acquired such a powerful heat from the beams thereof, as to fold all their larger leaves, to the no small prejudice of the plants: nay, sometimes large quantities of plants have been so affected therewith, as never to be worth any thing after.

If your plants have succeeded well, toward the end of April some of them will begin to fruit: you must therefore look over them exactly every other day, and when you see the flower plainly appear, you must break down some of the inner leaves over it to guard it from the sun, which would make the flower yellow and unsightly if exposed thereto; and when you find your flower at its full bigness (which you may know by its outside parting as it would run), you must then draw it out of the ground, and set cut them off, leaving the stalk in the ground, as is by some practised;

Brilliant

Brassica.

and if they are designed for present use, you may cut them out of their leaves; but if designed to keep, you should preserve their leaves about them, and put them into a cool place; the best time for pulling them is in a morning, before the sun hath exhale the moisture; for cauliflowers pulled in the heat of the day, lose that firmness which they naturally have, and become tough.

But to return to our second crop (the plants being raised and managed as was directed for the early crop, until the end of October), you must then prepare some beds, either to be covered with glass-frames, or arched over with hoops, to be covered with mats, &c. These beds should have some dung laid at the bottom, about six inches or a foot thick, according to the size of your plants; for if they are small, the bed should be thicker of dung to bring them forward, and so vice versa; this dung should be beat down close with a fork, in order to prevent the worms from finding their way through it; then lay some good fresh earth about four or five inches thick thereon, in which you should plant your plants about two inches and a half square, observing to shade and water them until they have taken new root; but you must not keep your coverings close, for the warmth of the dung will occasion a large damp in the bed, which, if pent in, will greatly injure the plants. When your plants have taken root, you must give them as much free open air as possible, by keeping the glasses off in the day-time as much as the weather will permit; and in the night, or at such times as the glasses require to be kept on, raise them up with props to let in fresh air, unless in frosty weather; at which time the glasses should be covered with mats, straw, pease-haulm, &c. but this is not to be done but in very hard frosts; you must also observe to guard them against great rain, which in winter time is very hurtful to them, but in mild weather, if the glasses are kept on, they should be propped to admit fresh air; and if the under leaves grow yellow and decay, be sure to pick them off: for if the weather should prove very bad in winter, so that you should be obliged to keep them close covered for two or three days together, as it sometimes happens, these decayed leaves will render the inclosed air very noxious; and the plants perspiring pretty much at that time, are often destroyed in vast quantities.

In the beginning of February, if the weather be mild, you must begin to harden your plants by degrees, that they may be prepared for transplantation: the ground where you intend to plant your cauliflowers out (which should be quite open from trees, &c. and rather moist than dry), having been well dunged and dug, should be sown with radishes a week or fortnight before you intend to plant out your cauliflowers; the sowing of radishes is particularly mentioned, because if there are not some radishes amongst them, and the month of May should prove hot and dry, as it sometimes happens, the fly will seize your cauliflowers, and eat their leaves full of holes, to their prejudice, and sometimes their destruction; whereas, if there are radishes upon the spot, the flies will take to them, and never meddle with the cauliflowers so long as they last: indeed, the gardeners near London mix spinach with their radish-seed, and so have a double crop; which is an advantage where ground is dear, or where persons are straitened for room; otherwise it is very well to have only one crop

amongst the cauliflowers, that the ground may be cleared in time.

Brassica.

Your ground being ready and the season good, about the middle of February you may begin to plant out your cauliflowers: the distance which is generally allowed by the gardeners near London (who plant other crops between their cauliflowers to succeed them, as cucumbers for pickling, and winter cabbages) is every other row four feet and a half apart, and the intermediate rows two feet and a half, and two feet two inches distance in the rows; so that in the latter end of May or beginning of June (when the radishes and spinach are cleared off), they put in seeds of cucumbers for pickling, in the middle of the wide rows, at three feet and a half apart; and in the narrow rows plant cabbages for winter use, at two feet two inches distance, so that these stand each of them exactly in the middle of the square between four cauliflower plants; and these after the cauliflowers are gone off, will have full room to grow, and the crop be hereby continued in a succession through the whole season.

There are many people who are very fond of watering cauliflower plants in summer; but the gardeners near London have almost wholly laid aside this practice, as finding a deal of trouble and charge to little purpose; for if the ground be so very dry as not to produce tolerable good cauliflowers without water, it seldom happens that watering of them makes them much better; and when once they have been watered, if it is not constantly continued, it had been much better for them if they never had any; as also, if it be given them in the middle of the day, it rather helps to scald them: so that, upon the whole, if care be taken to keep the earth drawn up to their stems, and clear them from every thing that grows near them, that they may have free open air, you will find that they will succeed better without than with water, where any of these cautions are not strictly observed.

But in order to have a third crop of cauliflowers, you should make a slender hot-bed in February, in which you should sow the seeds, covering them a quarter of an inch thick with light mould, and covering the bed with glass-frames. When the plants are come up, and have gotten four or five leaves, you should prepare another hot-bed to prick them into, which may be about two inches square; and in the beginning of April harden them by degrees, to fit them for transplanting, which should be done the middle of that month, at the distance directed for the second crop, and must be managed accordingly: these (if the soil is moist where they are planted, or the season cool and moist) will produce good cauliflowers about a month after the second crop is gone, whereby their season will be greatly prolonged.

There is also a fourth crop of cauliflowers, which is raised by sowing the seed about the 23d of May; and being transplanted, as hath been before directed, will produce good cauliflowers in a kindly season and good soil after Michaelmas, and continue through October and November, and, if the season permit, often a great part of December.

All the species of cabbage are supposed to be hard of digestion, to afford little nourishment, and to produce flatulencies, though probably on no very good foundation. They tend strongly to putrefaction. and

Qualities, &c.

Brassicavit
||
Brauronia.

run into this state sooner than almost any other vegetable; when putrefied, their smell is likewise the most offensive, greatly resembling that of putrefied animal substances. A decoction of them is said to loosen the belly. Of all these plants cauliflower is reckoned the easiest of digestion. The white is the most fetid, and the red most emollient or laxative; a decoction of this last is recommended for softening acrimonious humours in some disorders of the breast, and in hoarseness. The red cabbage is chiefly used for pickling. In some countries they bury the white cabbage when full grown in the autumn, and thus preserve it all winter. The Germans cut them to pieces, and, along with some aromatic herbs and salt, press them close down in a tub where they soon ferment, and are eaten under the name of *Sour-craut*. See that article.

BRASSICAVIT, or **BRACHICAVIT**, in the manege, is a horse whose fore-legs are naturally bended archwise: being so called by way of distinction from an arched horse, whose legs are bowed by hard labour.

BRAULS, Indian cloths with blue and white stripes. They are otherwise called *turbants*, because they serve to cover those ornaments of the head, particularly on the coast of Africa.

BRAUN (George), in Latin *Braunius*, archdeacon of Dortmund, and dean of Notre Dame in Gradibus, at Colonge. He published a Latin oration against the priests guilty of fornication; he also wrote the life of Jesus Christ, that of the Holy Virgin, and a controversial treatise against the Protestants; but his chief work is the *Theatrum Urbium*, in several volumes folio.

BRAUNA, a town of Germany, in Bavaria, seated on the river Inn. It has a strong fortress: notwithstanding, it was taken by the Austrians in 1743. E. Long. 13. 3. N. Lat. 48. 10.

BRAUNSBURG, a town of Poland, in Regal Prussia, with a very commodious harbour, and belonging to the king of Prussia. It is seated near the Baltic sea, in E. Long. 20. 0. N. Lat. 54. 15.

BRAUNSFELD, a town of Germany, in the circle of the Upper Rhine, and country of Sohnes, with a handsome palace or castle. E. Long. 8. 32. N. Lat. 50. 22.

BRAVO, one of the Cape de Verd islands on the coast of Africa, remarkable for its excellent wines, and inhabited by Portuguese. The land is very high, and consists of mountains which look like pyramids. It abounds in Indian corn, gourds, water-melons, potatoes, horses, asses, and hogs. There is also plenty of fish on the coast, and the island produces salt-petre. W. Long. 25. 35. N. Lat. 14. 0.

BRAVO, a town of Africa, on the coast of Ajan, with a pretty good harbour. It is an independent place, and is about 80 miles distant from Magadoxo. E. Long. 41. 35. N. Lat. 1. 0.

BRAURONIA, in Grecian antiquity, a festival in honour of Diana, surnamed *Brauronia*, from its having been observed at Brauron, an Athenian borough. This festival was celebrated once in five years, being managed by ten men, called in Greek [*ier. prii*]. The victim offered in sacrifice was a goat, and it was customary for certain men to sing one of Homer's Iliads. The most remarkable persons at this solemnity were young virgins, habited in yellow gowns, and conse-

crated to Diana. It was unlawful for any of them to be above ten or under five years of age.

BRAWN, the flesh of a boar sliced or pickled; for which end the boar should be old: because the older he is, the more horny will the brawn be.—The method of preparing brawn is as follows: The bear being killed, it is the slices only, without the legs, that are made brawn; the bones of which are to be taken out, and then the flesh sprinkled with salt, and laid in a tray, that the blood may drain off: Then it is to be salted a little, and rolled up as hard as possible. The length of the collar of brawn should be as much as one side of the boar will bear, so that when rolled up it will be nine or ten inches diameter.

The collar being thus rolled up, is to be boiled in a copper, or large kettle, till it is so tender, that you can run a straw through it; then let it by till it is thorough cold, and put it into the following pickle. To every gallon of water, put a handful or two of salt, and as much wheat-bran: Boil them together, then drain the bran as clear as you can from the liquor; and when the liquor is quite cold, put the brawn into it.

BRAY (Sir Reginald), a celebrated architect and politician, was the second son of Sir Richard Bray, one of the privy council to king Henry VI. Sir Reginald was instrumental in the advancement of king Henry VII. to the throne of England; and was greatly in the favours of that prince, who bestowed honours and wealth upon him. His skill in architecture appears from Henry VII.'s chapel at Westminster, and the chapel of St George at Windsor, as he had a principal concern and direction in the building of the former, and the finishing and bringing to perfection the latter, to which he was also a liberal benefactor. In the middle of the south aisle of the above chapel is a spacious chapel built by him, and still called by his name. He died in 1501; and was interred in the above chapel, probably under the stone where lies Dr Waterland; for, on opening the vault for that gentleman, who died in 1740, a leaden coffin of ancient form was found, which, by other appearances, was judged to be that of Sir Reginald, and was, by order of the dean, immediately arched over.

BRAY (Dr Thomas), an eminent, learned, and pious divine, was born at Marton, in Shropshire, in the year 1656, and educated at Oxford. He was at length presented to the vicarage of Over-Whitacre, in Warwickshire; and in 1690, to the rectory of Sheldon, where he composed his *Catechetical Lectures*; which procured him such reputation, that Dr Compton, bishop of London, pitched upon him as a proper person to model the infant church of Maryland, and establish it upon a solid foundation, and for that purpose he was invested with the office of commissary. He now engaged in several noble undertakings. He procured sums to be raised for purchasing small libraries for the use of the poor ministers in the several parts of our plantations; and the better to promote this design, he published two books; one intitled *Bibliotheca parochialis*, or a scheme of such theological and other heads as seem requisite to be perused or occasionally consulted by the clergy, together with a catalogue of books which may be profitably read on each of those points; the other, Apostolical charity, its nature and excellency considered.

E ay.

Bray
||
Brazil.

He endeavoured to get a fund established for the propagation of the gospel, especially among the uncultivated Indians; and by his means a patent was obtained for erecting the corporation called *The society for the propagation of the gospel*. He, by his industry, procured relief for prisoners; and formed the plan for the society for the reformation of manners, charity-schools, &c. He wrote, 1. his *Martyrology*, or Papal usurpation, in one volume folio; 2. *Directorium missionarium*; and other works. This excellent man died in 1730, aged 73.

BRAY, a port town of Ireland, in the county of Wicklow, and province of Leinster, seated on St George's channel, eight miles south of Dublin. W. Long. 6. 16. N. Lat. 53. 8.

Bray sur Seine, a town of France, in Champagne, and in Senonois, on the confines of Brie. E. Long. 2. 15. N. Lat. 48. 35.

BRAYLE, among sportsmen, a piece of leather fit to put upon the hawk's wing, to tie it up.

BRAZED, in heraldry, a term serving to describe three chevrons, one clasping another.

BRAZEN, something consisting of brass, or formed out of it. See BRASS.

Brazen Age. See AGE.

Brazen Dish, among vintners, is the standard by which the other dishes are gauged, and is kept in the king's hall.

Brazen Sea, in Jewish antiquity, one of the sacred utensils in the temple of Solomon. It was cast in the plain of Jordan, and removed from thence into the inner court of the temple: where it was placed upon 12 oxen, three of which looked towards each quarter of the world. It was ten cubits from the one brim to the other, five cubits in height, and 30 cubits in circumference, and contained 3000 baths. The brim of it was perfectly round, and so it continued in the two upper cubits; but below the brim, in the three lower cubits, it was square. It was a hand-breadth thick, and the brim was wrought like the brim of a cup, with flowers of lilies. About the body of this huge vessel there were two borders of engravings, being the heads of oxen in demi-relief; out of which some suppose the water issued, and that they were made as cocks and conveyances for that purpose.—This brazen or molten sea, was designed for the priests to wash themselves in, before they performed the service of the temple. The supply of water was through a pipe out of the well Etam; though some are of opinion, that it was constantly supplied with water by the Gibeonites.

BRAZIER, an artificer who makes and deals in all kinds of brass ware. This trade, as exercised in Britain, may be reckoned a branch of the smithery, though they seldom keep forges, except for brazing, or soldering, and tinning the insides of their vessels, which they work up chiefly out of copper and brass prepared rough to their hands. They consist of a working part, and a shop-keeping part, which latter many carry on to a great extent, dealing as well in all sorts of iron and steel, as copper and brass goods for household furniture; and lately have fallen much into selling what is called *French plate*, made of a sort of white metal, silvered and polished to such a degree that the eye cannot soon distinguish it from real silver.

BRAZIL. See BRASIL.

Brazing
||
Bread.

BRAZING, the soldering or joining two pieces of iron together by means of thin plates of brass, melted between the pieces that are to be joined. If the work be very fine, as when two leaves of a broken saw are to be brazed together, they cover it with pulverized borax, melted with water, that it may incorporate with the brass powder, which is added to it: The piece is then exposed to the fire without touching the coals, and heated till the brass is seen to run.

BRAZING is also the joining two pieces of iron together by beating them hot, the one upon the other, which is used for large pieces by farriers, &c.

BRAZZA, a town and island on the coast of Dalmatia, in the gulph of Venice, opposite to Spalatto, and subject to Venice. E. Long. 28. 0. N. Lat. 43. 0.

BREACH, in a general sense, denotes a break or rupture in some part of a fence or inclosure, whether owing to time or violence.—Inundations, or overflowings of lands, are frequently owing to breaches in the dikes or sea-banks. Dagenham breach is famous; it was made in 1707, by a failure of the Thames wall in a very high tide. The force wherewith it burst in upon the neighbouring level tore up a large channel or passage for water 100 yards wide, and in some places 20 feet deep, by which a multitude of subterraneous trees that had been buried many ages before were laid bare.

BREACH, in fortification, a gape made in any part of the works of a town by the cannon or mines of the besiegers, in order to make an attack upon the place. To make the attack more difficult, the besieged sow the breach with crow-feet, or stop it with *chevaux de frize*.—A practicable breach, is that where the men may mount and make a lodgment, and ought to be 15 or 20 fathoms wide. The besiegers make their way to it, by covering themselves with gabions, earth-bags, &c.

BREACH, in a legal sense, is where a person breaks through the condition of a bond or covenant; on an action upon which, the breach must be assigned: And this assignment must not be general, but particular, as, in an action of covenant for not repairing houses, it ought to be assigned particularly what is the want of reparation; and in such certain manner, that the defendant may take an issue.

BREAD, a mass of dough kneaded and baked in an oven. See BAKER, BAKING, and BARN.

The grains of all vegetables are almost entirely composed of substances very proper for the nourishment of animals; and amongst grains those which contain a farinaceous matter are the most agreeable and most nutritive. *Macquet's Chem. Dict.*

Man, who appears to be designed by nature to eat of all substances which are capable of nourishing him, and still more of vegetables than animals, has, from time immemorial, and in all parts of the earth, used farinaceous grains as the principal basis of his food: but as these grains cannot be without difficulty eaten by men in their natural state, this active and intelligent animal has gradually found means not only to extract the farinaceous part, that is, the only nutritive part of these grains, but also to prepare it so that it becomes a very agreeable and wholesome aliment, such as the bread we now generally eat.

Nothing appears so easy at first sight as to grind corn,

Bread corn, to make a paste with the flour and water, and to bake this paste in an oven. They who are accustomed to enjoy the advantages of the finest human inventions, without reflecting on the labour it has cost to complete them, think all these operations common and trivial. However, it appears very certain, that for a long time men no otherwise prepared their corn than by boiling and forming compact viscous cakes, not very agreeable to the taste, and of difficult digestion, before they were able to make bread of good taste and quality, as we have now. It was necessary to invent and complete ingenious machines for grinding corn, and separating the pure flour with little trouble and labour; and that inquiries, or rather some happy chance, which some observing person availed himself of, should discover, that flour, mixed with a certain quantity of water, is susceptible of a fermentation which almost entirely destroys its viscosity, heightens its taste, and renders it proper to make a light bread, very agreeable to the taste, and of easy digestion.

This essential operation, on which the good quality of bread depends, is entirely of the province of chemistry. It would add to the honour of the ancient cultivators of chemistry, to attribute to them so useful and important a discovery; but, unhappily, it is too probable that they had no share in it. The ancient chemists were engaged in other pursuits than that of bread and other common objects. They hoped to make gold; and what is bread in comparison with gold?

However that be, to the fortunate invention of raising the paste before baking we owe the perfection of the art of making bread. This operation consists in keeping some paste or dough, till by a peculiar spirituous fermentation it swells, rarefies, and acquires a smell and taste quick, pungent, spirituous, somewhat sour, and rather disagreeable. This fermented dough is well worked with some fresh dough, which is by that mixture and moderate heat disposed to a similar but less advanced fermentation than that above mentioned. By this fermentation the dough is attenuated, and divided; air is introduced into it, which, being incapable of disengaging itself from the tenacious and solid paste, forms in it small cavities, raises and swells it; hence the small quantity of fermented paste which disposes the rest to ferment, is called *leaven* from the French word *lever*, signifying to raise.

When the dough is thus raised, it is in a proper state to be put into the oven; where, while it is baked, it dilates itself still more by the rarefaction of the air, and of the spirituous substance it contains, and it forms a bread full of eyes or cavities, consequently light, and entirely different from the heavy, compact, viscous, and indigested masses made by baking unfermented dough.

The invention of beer, or wine of grains, furnishes a new matter useful in the making of bread. This matter is the froth which forms upon the surface of these liquors during fermentation. When it is mixed with dough, it raises it better and more quickly than ordinary leaven. It is called *yeast* or *brann*. By means of this, the finest lightest bread is made. It often happens, that bread made with leaven dough has a sourish and not agreeable taste; which may proceed

Bread from too great a quantity of leaven, or from leaven in which the fermentation has advanced too far. This inconvenience does not happen to bread made with yeast; because the fermentation of this substance is not too far advanced, or because more attention is given to that finer bread.

It may be asked, Why, since dough is capable of fermenting spontaneously and singly, as we see from the leaven, a substance is added to dispose it to ferment? The true reason is, That all the parts of a fermenting substance do not ferment at the same time, nor to the same degree; so that some parts of this substance have finished their fermentation, while others have not yet begun. The fermentable liquors which contain much sugar, as hydromel, and must of wines, give proofs of this truth; for, after these liquors have become very vinous, they have still very distinctly a saccharine taste: but all saccharine matter is still susceptible of fermentation: and, in fact, if vinous hydromel, or must, or even new beer, be distilled, so that all their ardent spirit shall be separated, and the residuums diluted with water, we shall see a second fermentation take place, and a new quantity of ardent spirit formed.

The same thing precisely happens to dough, and still more sensibly, from its viscosity and want of fluidity; so that if it be left to ferment alone, and without the help of leaven, as the fermentation proceeds very slowly and successively, the parts which ferment first will have become sour and vapid before all the rest be sufficiently attenuated and changed, by which the bread will acquire a disagreeable taste.

A mixture of a small quantity of leaven with dough effectually prevents this inconvenience; because the effect of this leaven, and of all fermenting substances, is to dispose to a similar fermentation all matters capable of it, with which it is mixed; or rather, by means of leaven, the fermentation of all the parts of such substances is effected more nearly at the same time.

Bread well raised and baked differs from unfermented bread, not only in being less compact, lighter, and of a more agreeable taste, but also in being more easily miscible with water, with which it does not form a viscous mass, which circumstance is of great importance in digestion.

It is observable, that without bread, or somewhat of this form, no nation seems to live. Thus the Laplanders, having no corn of their own, make a sort of bread of their dried fishes, and of the inner rind of the pine, which seems to be used, not so much for their nourishment, as for supplying a dry food. For this mankind seem to have an insurmountable aversion to bland, slippery, and mucilaginous foods. This is not commonly accounted for, but seems to depend on very simple principles. The preparation of our food depends on the mixture of the animal fluids in every stage. Among others, the saliva is necessary, which requires dry food as a necessary stimulus to draw it forth, as bland, slippery, fluid aliments are too inert, and are kept so long stay in the mouth, to produce this effect, or to excite sufficient degree of manducation to crush that liquor. For this reason we commonly use dry bread along with animal food, which otherwise would be too quickly swallowed. For blinding the oil and water of bread, nothing is so fit to be added, as distilled by a previous induration. For which purpose, bread is of fine quality

Ereal. sity in the stomach, as it is proper that a substance of solid consistence should be long retained there. Now the animal fluids must be mixed with our aliments, in order to change the acceſſency it undergoes. But liquid foods would not attain this end, whereas the solid stimulates and emulges the glands of the stomach. The bread then appears to be exceedingly proper, being bulky without too much solidity, and firm without difficulty of solution.

Suppl. to
Clemens's
Diss.

Among the ancients we meet with various denominations of bread; as, 1. *Panis siliagineus*, called also *mundus*, *athleticus*, *isurgis*, *coliphis*, and *robys*, answering to our white bread; being made of the purest flour of the best wheat, and only used by the richer sort. 2. *Panis secundus* or *secundarius*, called also *smilaceus* or *fruilagineus*, the next in purity; being made of fine flower, only all the bran not sifted out. 3. *Austopyrus*, called also *syncomistus* and *confusaneus*, made of the whole substance of the wheat, without either retrenching the finer flour or coarser bran; answering to our household bread. 4. *Cacabaceus*, apparently the same with what was otherwise denominated *fordidus*, as being given to dogs; *sursuraceus*, *fursiveus*, or *fursoraticus*, because made in great part of bran; and, in the middle age, *biffus*, on account of its brownness; sometimes also *leibo*. There were other sorts of bread, denominated from the manner in which they were made, or the uses they were applied to; as, 1. The *militaris*, which was prepared by the soldiers and officers in camp with their own hands; for which purpose some had hand-mills, others pounded the corn in a mortar, and baked it on the coals. 2. *Clibanites*, that baked in an oven, by way of contradistinction from that baked on the hearth or under the embers. 3. That called *subcineritius*, or *sub cinere coctus*; sometimes also *reversatus*, because it was to be turned in the baking. 4. *Nauticus*, answering to our sea-biscuit, and denominated accordingly *bis coctus*, because baked several times over to make it keep the longer. Other kinds of bread were denominated from their qualities and accidents; as, 1. The *panis ficcus*, that which had been long baked; such as were the *bis coctus*, naval and buccellated bread. 2. *Madidus*, a sort made of rye or bear, sometimes also made of fine flower, wherewith they smeared their faces, by way of a cosmetic, to render them smooth. 3. *Acidus*, or sour bread, which was acidulated with vinegar. 4. *Azymus*, that unleavened or unfermented.

The French have also a great variety of breads; as queen's bread, alamode bread, bread de Segovie, de Gentillay, quality-bread, &c. all prepared in peculiar manners by the bakers of Paris. The bread de Gonesse excels all others, on account of the waters at Gonesse, a town three leagues from Paris. It is light, and full of eyes, which are the marks of its goodness. *Pain de ménage*, is that which each family bakes for itself. Spice-bread, *pain d'epice*, denotes bread baked and iced over with the scum taken off sugar in refining houses; it is sometimes also made with honey and other sorts of seasoning, and answers to what the ancients call *panis melilitus*.

Among us, bread is chiefly divided into white, wheaten, and household; differing only in degrees of purity. In the first, all the bran is separated; in the second, only the coarser; in the third, none at all: so

N^o 54.

that fine bread is made only of flour; wheaten bread, of flour and a mixture of the finer bran; and household, or the whole substance of the grain, without taking out either the coarse bran or fine flower. We also meet with fymnel bread, manchet, or roll bread, and French bread: which are only so many denominations of the finest and whitest bread, made of the purest flour; except that in ill-roll bread there is an addition of milk; and in French bread, of eggs and butter also. In Lancashire, and several of the northern counties of England, they have several sorts of oaten bread; as, 1. The bannock, which is an oat-cake, kneaded only with water, and baked on the embers. 2. Clap-bread, which is made into thin hard cakes. 3. Bitchin's bread, which is made of thin batter, and made into thin soft oat-cakes. 4. Riddle-cakes, which are thick and four, have but little leaven, and are kneaded stiff. And, 5. Jannock, which is oaten bread made up into loaves. Add to these, *pease-bread*, much used in many parts of Scotland; being bread consisting either wholly of the flour of pease, or of this and oat-meal mixed: the dough, sometimes leavened, sometimes made only with water, is formed either into bannocks or cakes, and baked over the embers; or into what they call *baps*, i. e. a kind of flattish rolls, and baked in the oven. In the statute of assize of bread and ale, 51 Hen. III. mention is made of waille-bread, cocket-bread, and bread of treet; which answer to the three kinds of bread now in use, called *white*, *wheaten*, and *household* bread. In religious houses, they heretofore distinguished bread by the names Esquires bread, *panis armigerorum*; monks bread, *panis conventualis*; boys bread, *panis paucorum*; and servants bread, *panis famulorum*, called also *panis serciantalis*. A like distribution obtained in the households of nobles and princes; where, however, we find some other denominations; as messengers bread, *panis nunciis*, that given to messengers as a reward of their labour; count bread, *panis curialis*, that allowed by the lord for the maintenance of his household; eleemosynary bread, that distributed to the poor by way of alms.

It is for the interest of the community that the food of the poor should be as various as possible, that, in time of dearth and scarcity of the ordinary kinds, they may not be without ready and cheap resources. To the discovery of such resources several benevolent philosophers having successfully turned their inquiries, we shall lay before the reader the result of their experiments.

1. *BREAD of Potatoes**. Potatoes, previously deprived of their skin, cut into thin slices, and put between paper, will dry in a heat somewhat less than 35° of Reaumur's thermometer; and, when thus dried, they will preserve their white colour. By this process they lose about two thirds of their weight, and they may then be reduced to a fine powder. A little of this powder thrown upon the fire sends out a smoke, accompanied with a smell resembling burnt bread. As this smell is perceived from all farinaceous vegetables when treated in the same manner, Mr Parmentier thinks it may be considered as the characteristic of the presence of an *amylaceus* † matter. This smell does not, however, he observes, arise from the amylaceous or fibrous part separately, but from both taken together. The powder of potatoes, but obtained in the manner described above, has the smell and taste of wheat; and, like it, is de-

Bread.

† See the note infra.

voured

Bread.

laceous matter, formed into a jelly, and diffused in water, keeps for a long time without suffering any change; it then turns acid, and at length putrefies.

The amylaceous matter of acrid and poisonous plants, although innocent and nutritive, cannot be converted into bread without the addition of some mucilaginous substance. In times of great scarcity, common bran will answer the purpose; but when potatoes are to be had, the addition of a proper proportion of these is to be preferred.

Mr Parmentier gives an account of the bread which he obtained from the amylaceous powders of the different vegetables mentioned above, with the addition of potatoes and a small quantity of common leaven of grain. This bread appeared in general to be well fermented; it was of a good white colour, and free from any disagreeable odour: but to the taste it was somewhat insipid: which, however, he imagines, might have been corrected by the addition of a proper quantity of salt.

As the resources against scarcity here pointed out can be procured only at particular seasons, the author proposes a method for preserving the matter thus obtained. For this purpose, he advises, that bread prepared in the manner mentioned above should be carefully dried, reduced to powder, and then kept in a close cask. By this means, he is of opinion that it may be preferred for a very long time, and will always be ready to make an agreeable and wholesome panada by the addition of a little butter and salt.

Mr Parmentier, in order to discover the degree of power wherewith this alimentary powder nourished, made himself the subject of experiment; and found, that three ounces of it for dinner, and as much for supper, made into panada with water, was a sufficient quantity of aliment for a day. From his discharge by stool while he used it, he had reason to believe that it is almost totally alimentary. He concludes with recommending it not only as useful in times of scarcity, but as a proper substitute for sea-biscuit, and as a species of food well adapted for armies and hospitals.

3. *Cheap method of making wholesome BREAD*, when wheat-flour is dear, by mixing turnip with it*.

"At the time I tried this method, bread was very dear, inasmuch that the poor people, in the country where I live, could hardly afford themselves half a meal a-day. This put me upon considering whether some cheaper method might not be found than making it of wheat-meal. Turnips were at that time very plentiful. I had a number of them pulled, washed clean, pared, and boiled; when they were become soft enough to mash, I had the greatest part of the water pressed out of them, and afterwards had them mixed with an equal quantity in weight of coarse wheat-meal; the

dough was then made in the usual manner, with yeast or barm, salt, water, &c. It rose very well in the trough; and after being well kneaded, was formed into loaves, and put into the oven to be baked. I had at the same time some other bread made with common meal in the ordinary way. I baked my turnip-bread rather longer than the other. When they were drawn from the oven, I caused a loaf of each sort to be cut; and found, on examination, the turnip-bread was sweeter than the other, to the full as light and as white, but had a little taste (though nowise disagreeable) of the turnip. Twelve hours afterwards I tasted my turnip-bread again, when I found the taste of the turnip in it scarce perceivable, and the smell quite gone off. On examining it when it had been baked 24 hours, had I not known that there were turnips in its composition, I should not have imagined it: it had, it is true, a peculiar sweetish taste, but by no means disagreeable; on the contrary, I rather preferred it to the bread made of wheat-meal alone. After it had been baked 48 hours, it underwent another examination, when it appeared to me to be rather superior to the other; it eat fresher and moister, and had not at all abated in its good qualities: to be short, it was still very good after a week; and, as far as I could see, kept as well as the bread made of common wheat-meal.

"In my trials of this bread by the taste, I was not satisfied with eating it by itself; I had some of it spread with butter; I tasted it with cheese; I eat of it toasted and buttered, and finally in boiled milk and in soup: in all these forms it was very palatable and good.

BREAD in medicine. Besides the alimentary, bread has also medical, qualities.—Decoctions, creams, and jellies of bread are directed in some dispensaries. Bread carefully toasted, and infused or lightly boiled in water, imparts a deep colour, and a sufficiently agreeable restringent taste. This liquor, taken as common drink, has done good service in a weak lax state of the stomach and intestines; and in bilious vomiting and purging, or the cholera morbus: examples are related in the Edinburgh essays of several cases of this kind cured by it, without the use of any other medicine.—In Westphalia there is a very coarse bread eaten, which still retains the opprobrious name given it by a French traveller of *Bonpournickel*, "good for his horse *Nickel*." It is the same with what the Romans called *panis fursuraceus*, or *panis impurus*, from its not being cleaned from the hulk; and *panis ater*, from the blackness of its colour: though we learn from Pliny, that the Romans for 300 years knew no other bread. The Germans* make two sorts of waters by distillation from this bread; the one with, the other without, the addition of a spirituous liquor: to both which great virtues are ascribed. That without

Bread.

* From a letter in the *Museum Rusticum et Commercial.*

* Hoffman *Obsr. Chem.*

not soluble in spirit of wine, vinegar, or cold water. It contains more acid, and less water, than the ordinary gums. It is found in many of those plants that make the nourishment of men and other animals. Hence Mr Parmentier concludes it to be the nutritive matter.

Though we are not to consider the glutinous matter as the nutritious part of vegetables, yet it is a very necessary ingredient. It is that which preserves the cohesion of the paste in fermenting bread: it is that which forms the viscid pellicle, and stops the air in fermentation; gives the flavoury taste to bread; occasions it to be light, to ferment, and which forms the small cells seen in it. It is found especially near the cortical part of grain; and this accounts for its being found in the greatest quantity in coarse brown meal. It is this gluten which renders wheat a superior aliment to the other grains and roots.

without any thing spirituous, is made out of the juice of craw-fish, may-dew, rose-water, nutmegs, and saffron, distilled from a large quantity of this bread. This is esteemed a great restorative, and given in hectic habits. The other is distilled from this bread and Rhinish wine, with nutmegs and cinnamon. This is given in all the disorders of the stomach, vomiting, loss of appetite, and other complaints of the same kind: and besides these, there is a spirit distilled from it by the retort in the dry way, which, when separated from its fetid oil, is esteemed a powerful sudorific, and very valuable medicine in removing impurities of the blood.

Bread is also medicinal, applied *externally*, as is vulgarly known*. Mr Boyle assures us he drew a menstruum from bread stronger than aquafortis, and which would act even upon glass itself †.

BREAD-TREE. See *ARTOCARPUS*.

Bees-BREAD. See *BEE*, n^o 12.

Cassia-BREAD. See *JATROPHA*.

Earth-BREAD †. "In the lordship of Moscow in the Upper Lutatia, a sort of white earth is found, of which the poor, urged by the calamities of the wars which raged in those parts, make bread. It is taken out of a hill where they formerly worked at saltpetre. When the sun has somewhat warmed this earth, it cracks, and small white globules proceed from it as meal; it does not ferment alone, but only when mixed with meal. Mr Sarlitz, a Saxon gentleman, was pleased to inform us, that he has seen persons who in a great measure lived upon it for some time. He assures us that he procured bread to be made of this earth alone, and of different mixtures of earth and meal; and that he even kept some of this bread by him upwards of six years: he further says, a Spaniard told him, that this earth is also found near Geronne in Catalonia."

Eucharist or Sacramental BREAD, in the Protestant churches, is common leavened bread, in conformity to the ancient practice. In the Romish mats, azymous or unleavened bread is used, particularly in the Gallican church, where a sort is provided for this purpose called *pan a chanter*, made of the purest wheaten flour pressed between two iron plates graven like wafer-moulds, being first rubbed with white wax to prevent the paste from sticking. The Greeks observe divers ceremonies in their making the eucharist bread. It is necessary the person who bakes it have not lain with his wife the day before; or, if it be a woman, that she have not conversed with her husband. The Abyssinians have an apartment in their churches for this service, being a kind of sacristy. F. Sirmond, in his dissertation on azymous bread, shows from the council of Toledo, that anciently there were as many ceremonies used in the Latin church in the preparation of their unleavened bread as are still retained in the eastern churches. He cites the example of Queen Radegonda, who distributed with her own hands, in the church, the bread which she herself had made. It appears also from the dispute of cardinal Humbert against the Greeks, that in the Latin church no bread was used for the eucharist, but what was taken out of the sacristy, and had been made by the deacons, subdeacons, and even priests, who rehearsed several psalms during the process.

Ecclesiastical writers enumerate other species of bread allotted for purposes of religion; as, 1. *Calendarius*,

that anciently offered to the priest at the kalends. 2. *Prebendarius*, the same with *capitularis*, that distributed daily to each prebendary or canon. 3. *Benedictus*, that usually given to catechumens before baptism, in lieu of the eucharistic bread, which they were incapable of partaking of. The *panis benedictus* was called also *panagium* and *eulogium*, being a sort of bread blessed and consecrated by the priest, whereby to prepare the catechumens for the reception of the body of Christ. The same was used afterwards, not only by catechumens, but by believers themselves, as a token of their mutual communion and friendship. Its origin is dated from the 7th century, at the council at Nantz. In the Gallican church we still find *panis benedictus*, *panis benit*, used for that offered for benediction, and afterwards distributed to pious persons who attend divine service in chapels. 4. Consecrated bread is a piece of wax, paste, or even earth, over which several ceremonies have been performed with benedictions, &c. to be sent in an *Agnus Dei*, or relic-box, and presented for veneration. 5. Unleavened bread, *panis azymus*. The Jews eat no other bread during their passover; and exact search was made in every house, to see that no leavened bread was left. The usage was introduced in memory of their hasty departure from Egypt, when they had not leisure to bake leavened. 6. Shew-bread was that offered to God every Sabbath-day, being placed on the golden table in the holy of holies.

Hofo-BREAD is made of wheat, oats, and beans; to which sometimes are added aniseed, gentian, liquorice, fenugreek, eggs, and ale; and sometimes rye and white wine are used.

For race-horses three sorts of bread are usually given with success, for the second, third, and fourth nights feeding: they are all made of beans and wheat worked with barm; the difference consisting chiefly in the proportion of the two former. In the first kind, three times the quantity of beans is used to one of wheat; in the second, equal quantities of both; in the third, three times the quantity of wheat to one of beans.

SAGO-BREAD. See *SAGO*.

*Assize** of *BREAD*. The price and weight of bread is regulated by the magistrates according to the price of wheat. We have divers tables of the weights of the loaves both of wheat, wheaten, and household bread, at every price of wheat. If bread want one ounce in 36, the baker formerly was to suffer the pillory: now, to forfeit 5 s. for every ounce wanting; and for every defect less than an ounce, 2 s. 6 d.; fresh bread being complained of and weighed before a magistrate within 24 hours after it is baked or exposed to sale within the bills of mortality, or within three days in any other place. It is to be observed, bread loses weight by keeping: in some experiments recited by Barroline, the diminution was near one fourth in six months. The same author assures us, that in Norway they make bread which keeps 30 or 40 years; and that they are there sonder of their old land bread, than elsewhere of new or soft; since the older it is, the more agreeable it grows. For their great feast, particular care is taken to have the oldest bread; so that, at the christening of a child, they have usually bread which had been baked perhaps at the christening of his grandfather. It is made of barley and oat-meal baked between two hollow stones.

Bread
||
Breast.

BREAD-Room, in a ship, that destined to hold the bread or biscuit.

The boards of the bread-room should be jointed and caulked, and even lined with tin plates or mats. It is also proper to warm it well with charcoal for several days before the biscuit is put into it; since nothing is more injurious to the bread than moisture.

BREADTH, in geometry, one of the three dimensions of bodies, which multiplied into their length constitutes a surface.

BREAK, in a general sense, signifies to divide a thing into several parts with violence.

In the art of war, to *break ground*, is to open the trenches before a place.

Among sportsmen, to *break a horse* in trotting, is to make him light upon the hand in trotting, in order to make him fit for a gallop. To *break a horse* for hunting, is to supple him, to make him take the habit of running.

BREAKERS, a name given by sailors to those billows that break violently over rocks lying under the surface of the sea. They are distinguished both by their appearance and sound, as they cover that part of the sea with a perpetual foam, and produce a hoarse and terrible roaring, very different from what the waves usually have in a deeper bottom. When a ship is unhappily driven among breakers, it is hardly possible to save her, as every billow that heaves her upwards seems to dash her down with additional force when it breaks over the rocks or sands beneath it.

BREAKING, in a mercantile style, denotes the becoming bankrupt. See **BANKRUPT**.

BREAKING-Bulk, in the sea language, is the same with unlading part of the cargo.

BREAKSPEAR (Nicholas). See **ADRIAN IV.**

BREAM, in ichthyology. See **CYPRINUS**.

To **BREAM**, to burn off the filth, such as grass, ooze, shells, or sea-weed, from a ship's bottom, that has gathered to it in a voyage, or by lying long in a harbour. This operation is performed by holding kindled furze, faggots, or such materials, to the bottom, so that the flame incorporating with the pitch, sulphur, &c. that had formerly covered it, immediately loosens and throws off whatever filth may have adhered to the planks. After this, the bottom is covered anew with a composition of sulphur, tallow, &c. which not only makes it smooth and slippery, so as to divide the fluid more readily, but also poisons and destroys those worms which eat through the planks in the course of a voyage. Breaming may be performed either when the ship lies aground after the tide has ebbed from her, or by docking, or by careening.

BREAST, in anatomy, denotes the fore-parts of the thorax. See **ANATOMY**, n^o 36, 111.

Smiting the breast is one of the expressions of penitence. In the Romish church, the priest beats his breast in rehearsing the general confession at the beginning of the mass.

BREASTS, or *Mammæ*, in anatomy. See **ANATOMY**, n^o 112.

The breasts are usually two; though we also meet with instances of *trimanie* or women with three breasts[†], and even some with four, all yielding milk alike †.

BREAST-Hooks, in ship-building, are thick pieces of

timber incurvated into the form of knees, and used to strengthen the fore-part of the ship, where they are placed at different heights directly across the stem, so as to unite it with the bows on each side. The breast-hooks are strongly connected to the stem and hawse-pieces by tree-nails, and by bolts driven from without through the planks and hawse-pieces, and the whole thickness of the breast-hooks, upon whose inside those bolts are forelocked or clinched upon rings. They are usually about one third thicker, and twice as long, as the knees of the decks they support.

BREAST-Plate, in antiquity, a piece of armour worn to defend the breast, originally believed to be made of hides, or hemp twisted into small cords, but afterwards made of brass, iron, or other metals, which were sometimes so exquisitely hardened, as to be proof against the greatest force.

BREAST-Plate, in Jewish antiquity, one part of the priestly vestments anciently worn by the high priests. It was a folded piece of the same rich embroidered stuff of which the *ephod* was made; and it was set with twelve precious stones, on each of which was engraven the name of the tribes. They were set in four rows, three in each row; and were divided from each other by the little golden squares or partitions in which they were set. The names of these stones, and that of the tribes engraven on them, as also their disposition on the breast-plate, are as follows:

Sardine. RUBEN	Emerald. JUDAH.	Ligure. GAD.	Beryl. ZEBULON
Topaz. SIMON	Sapphure. DAN	Agate. ASHEP.	Onyx. JOSEPH.
Amethyst. LEVI	Diamond. NAPHTHALI	Chrysolite. ISACHAR.	Jasper. BENJAMIN.

This breast-plate was fastened at the four corners; those on the top to each shoulder by a golden hook or ring at the end of a wreathed chain; and those below, to the girdle of the *ephod*, by two strings or ribbons, which had likewise two rings and hooks.

This ornament was never to be severed from the priestly garment; and it was called the *memorial*, to put the high-priest in mind how dear those tribes ought to be to him, whose names he wore on his breast. It is also called the *breast-plate of judgment*, because it had the divine oracle of *Urim and Thummim* annexed to it. See **URIM AND THUMMIM**.

BREAST-Plate, in the manege, the strap of leather that runs from one side of the saddle to the other, over the horse's breast, in order to keep the saddle tight, and hinder it from sliding backwards.

BREAST-Work, in fortification, the same with **PARAPET**.

BREATH, the air inspired and expelled again in the action of respiration.

The ancients were very watchful over the last breath of dying persons, which the nearest relations, as the mother, father, brother, or the like, received in their mouths.

BREATHING, the same with **RESPIRATION**.

BRECHIN, a town of Scotland, in the county of Angus, situated in E. Long. 2 18. N. Lat. 56. 40. It consists.

p. 133.

Brechin. consists of one large handsome street, and two smaller; and is seated on the side of a small hill, washed by the river Southesk, over which there is a stone-bridge of two large arches. At the foot of the town is a long row of houses independent of it, built on ground held in feu from the family of Northesk. It is a royal borough, and, with four others, sends a member to parliament. In respect to trade, it has only a small share of the linen manufacture. It lies at no great distance from the harbour of Montrose; and the tide flows within two miles of the town; to which a canal might be made, which perhaps might create a trade, but would be of certain service in conveying down the corn of the country for exportation.

*Pennant's
Tour in Scot-
land.*

Brechin was a rich and ancient bishopric founded by David I. about the year 1150. At the Reformation, its revenues, in money and in kind, amounted to 7000 l. a-year; but, after that event, were reduced to 1500 l. chiefly by the alienation of lands and tithes by Alexander Campbell, the first Protestant bishop, to his chieftain the earl of Argyll.—The Culdees had a convent here. Their abbot Leod was witness to the grant made by king David to his new abbey of Dunfermline. In after time, they gave way to the Mathurines or Red Friars. The ruins of their house, according to Maitland, are still to be seen in the College Wynd.—Here was likewise an hospital called *Maison de Dieu*, founded in 1256, by William de Brechin, for the repose of the souls of the kings William and Alexander; of John earl of Chester, and of Huntingdon his brother; of Henry his father, and Juliana his mother. Albion bishop of Brechin, in the reign of Alexander II. was witness to the grant. By the walls which are yet standing, behind the west end of the chief street, it appears to have been an elegant little building.

The cathedral is a Gothic pile, supported by 12 pillars; is in length 166 feet, in breadth 61; part is ruinous, and part serves as the parish-church. The west end of one of the aisles is entire: its door is Gothic, and the arch consists of many mouldings; the window of it next tracery. The steeple is a handsome tower, 125 feet high; the four lower windows in form of long narrow openings; the belfry windows adorned with that species of opening called the *quatrefoil*: the top battlemented, out of which rises a handsome spire.—At a small distance from the aisle stands one of those singular round towers whose use has so long baffled the conjectures of antiquaries. These towers appear to have been peculiar to North-Britain and Ireland: in the last they are frequent; in the former, only two at this time exist. That at Brechin stood originally detached from other buildings. It is at present joined near the bottom by a low additional aisle to the church, which takes in about a sixth of its circumference. From this aisle there is an entrance into it of modern date, approachable by a few steps, for the use of the ringers; two handsome bells are placed in it, which are got at by means of six ladders placed on wooden fencircular floors, each resting on the circular abutments within side of the tower. The height from the ground to the roof is 80 feet; the inner diameter, within a few feet of the bottom, is 8 feet; the thickness of the wall at that part, 7 feet 2 inches; so that the whole diameter is 15 feet 2 inches; the circumference very near 48 feet; the inner diam-

eter at top is 8 feet 7 inches; the thickness of the walls, 4 feet 6 inches; the circumference, 38 feet 8 inches; which proportion gives the building an inexpressible degree: the top is roofed with an octagonal false 23 feet high, which makes the whole 103. In this spire are four windows placed alternate on the files, resting on the top of the tower; near the top of the tower are four others facing the four cardinal points; near the bottom are two and one within another, in relief; on the top of the steeple is a crucifixion; between the mouldings of the utmost and inner are two figures; one of the Virgin Mary; the other of St John, the cup, and lamb. On each corner of the bottom of this tower is a figure of certain beasts; one probably the Caledonian bear; and the other, with a lion's front, the bear. The stone-work within the inner arch has a small slit or peep-hole, but without the appearance of there having been a door within any modern period; yet there must have been one originally; for the filling up consists of larger stones than the rest of the curious round. The whole is built with most elegant masonry, which Mr Gough observed to be composed of 60 courses.—This tower hath often been observed to vibrate with a high wind.

The castle of Brechin was built on an eminence, a little south of the town; it underwent a long siege in the year 1303; was gallantly defended against the English under Edward III.; and, notwithstanding all the efforts of that potent prince, the brave governor Sir Thomas Maule, ancestor of the present earl of Panmure, held out this small fortress for 20 days, till he was slain by a stone cast from an engine on the 26th of August, when the place was instantly surrendered. The family of Panmure have now a noble house on the site of the old castle.—Brechin is also remarkable for a battle fought near it, in consequence of the rebellion raised in 1452, on account of the murder of the earl of Douglas in Stirling castle. The victory fell to the royalists under the earl of Huntly. The malcontents were headed by the earl of Crawford, who, retiring to his castle of Fishaven, in the frenzy of disgrace declared, that he would willingly pass seven years in hell, to obtain the glory which fell to the share of his antagonist.

BRECKNOCK, or **BRECONS**, a town of Brecknockshire in Wales, and capital of the county. It is called by the Welch *Aber Honddy*, and is seated at the confluence of the rivers Hondey and Yrk, over which there is a handsome stone bridge. It is an ancient place, containing three churches, one of which is collegiate, and is seated at the west end of the town. The houses are well built. Here was formerly a stately castle, and a strong wall, through which there were three gates, they are all demolished. It sends one member to parliament. It is well inhabited, which is in some measure owing to its being the town where the assizes are kept; and there is here a considerable woollen-manufacture. The markets are well supplied with cattle, corn, and provisions. W. Long. 3. 15. N. Lat. 52. 0.

BRECKNOCKSHIRE, a county of Wales, bounded by Radnorshire, on the north; Cardiganhire and Caermarthenshire, on the west; Herefordshire and Monmouthshire, on the east; and by Glamorganshire and Monmouthshire, on the south. It is 35 miles in length, 30 in breadth, and about 100 in circumference. It is surrounded with hills, which render the climate

Brechin
Castle
Brechin

Brecknock-
shire,
Bred.

the vall-ys pretty temperate. The soil on the hills is very stony, but the streams descending from thence into the vall-ys render them fruitful both in corn and grafs. The chief commodities here are corn, cattle, fish, and otter's fur, besides manufactures of cloth and stockings. The principal rivers are the Uik, the Wye, and the Yrwon. The chief towns are Brecknock, Bealt, and Hay.

Two miles to the east of Brecknock is a large lake, called *Brecknock Meer*, and by the Welch *Llyn Sawad-dan*: it is two miles in length, and nearly the same in breadth. It contains plenty of otters, tench, perch, and eels. The county sends one member to parliament. It is in the diocese of Landaff, and contains 61 parishes, and is divided into six hundreds.

BREDA, a town in Holland, the capital of Dutch Brabant. It is a large, populous, well built city, regularly fortified after the modern way, and is one of the strongest places on the Dutch frontiers. It is seated on the river Meek, in a marshy country, which may be overflowed and rendered inaccessible to an army. It is 4000 paces in circumference, and contains upwards of 2000 houses. The town is of a triangular figure, and the ramparts are all planted round with elms. At every angle there is a gate built with brick. The great church is a noble structure, remarkable for its fine spire, which is 362 feet high. The mausoleum of Angelbert II. count of Nassau, is a curious piece adorned with several statues and inscriptions suitable to the occasion. In 1577 the garrison delivered this city to the States-general; but it was retaken in 1581 by Cloude de Barlaimont, assisted by the baron de Fresin, who was prisoner therein. In 1590, prince Maurice took it again from the Spaniards.

In 1625 it was invested by Spinola; when it endured a siege too remarkable not to deserve a particular detail.

The citadel, which formed the residence of the princes of that family, was surrounded by a ditch of prodigious depth filled with water, and a strong wall defended by three great bastions; and the arsenal was celebrated for its extent, and the vast quantities of arms and military stores it contained. Spinola, perfectly acquainted with the strength of the place, thought he should expose his whole army to imminent destruction, should he attempt an assault before he had regularly carried on his approaches. He even resolved upon reducing the city by famine, as the method attended with least danger to his army; and accordingly began with drawing trenches round, for the space of four miles, erecting forts and redoubts at certain distances.

On the other hand, the garrison, consisting of seven thousand infantry, and several troops of horse, composed of English, French, and Dutch soldiers, took the most vigorous measures for their own defence. The English were under the command of Colonel Morgan, who had frequently distinguished his valour in the service of the states: the French were directed by colonel de Hauterive; and the Dutch troops were subject to the immediate orders of colonel Lohse, though the whole received their instructions from Justin de Nassau, the governor. The first advantage was gained by Bagnou, who seized a large convoy of provisions and stores coming up the river, converting the boats into a bridge. This led dispirited the besieged, and reduced them to

a stated allowance of bread; and what added to their misfortunes, though they were ignorant of it, was the death of Prince Maurice, from whom they were in hopes of receiving relief.

Meanwhile Spinola prosecuted the siege with the utmost diligence and vigour. On his pushing his trenches near the bastions, the besieged began a terrible fire to retard his approaches, and kept it up with such vehemence and obstinacy, that Spinola was in hopes they must soon surrender for want of ammunition. But here he formed a false judgment of the prudence of Justin de Nassau, who finding he could not accomplish his purpose by his firing, resolved to try the effect of water. With this view, he stopped up the course of the river Mark; and having formed a large basin of water, opened the sluices, swept away men, horses, and houses, in an inundation, and overflowed the whole country. The chief force of the torrent fell upon Spinola's quarters, and he exerted his utmost ability to remove the consequences. He dug large pits, and cut out ditches and canals to receive the water; but these being filled, and the whole ground covered over, so as to appear one uniform mass of water, served only to entrap his cavalry. The inundation was augmented by the rains which happened to fall; a mortality among the soldiers and horses ensued; and of his whole army, Spinola had scarce twelve thousand men fit for service by the month of December. With these inconsiderable remains, lines of vast extent were to be defended, the works were to be advanced, the sallies from the garrison repulsed, and provisions to be conveyed into the camp, while Spinola, the soul of action, was confined to a sick-bed.

In the garrison, an epidemical disease and scarcity likewise prevailed; but the excellent regulations made, and strictly observed, enabled the town to hold out three or four months beyond the time expected. The magistrates bought the corn for the bakers; obliging them to sell the bread to the inhabitants and garrison at a price affixed, and returning the overplus of their pay to the soldiers. A variety of other prudent regulations were established by the magistrates and governor, such as we do not find equalled by any instances recorded in history upon a similar occasion, and all evincing the steadiness, sagacity, courage, and ability, of Justin de Nassau. A kind of rivalry appeared between him and Spinola, which should best fulfil their several duties. The Spanish general caused himself to be carried about the works in a litter; he inspected and directed every thing; and displayed the activity of full health at the time his life was in imminent danger from an acute malady. He ordered several breaches in the lines to be repaired. These the Hollanders had made by sap, with a view of introducing succours to the besieged. He drove piles into all the ditches and canals through which their boats could pass. He made drains, to clear off the waters of the river Mark; and succeeded in a great measure by dint of perseverance, vigilance, and conduct. He was now reinforced with a body of eight thousand foot, and one thousand five hundred horse; many of the sick were perfectly recovered by his extreme care; and his army was again become formidable, amounting to twenty five thousand infantry and eight thousand cavalry. Nor was prince Henry idle, who now succeeded to the

Breda.

Breda.

titles and dominions of his brother Maurice, and was elected governor of Holland, Zealand, Guelderland, Utrecht, and Overijssel. He pressed France for assistance, and was joined by a body of cavalry under the conduct of the count de Roussi and the marquis de Rambures. With this reinforcement, and a body of German infantry, he attacked the enemy's lines, and after an obstinate conflict was repulsed. He advanced a second time; but Spinola, who entertained a high opinion of his valour and conduct, did not choose to wait for him in his lines; he marched out with the greater part of his army, seized upon a convenient post, and obliged the prince a second time to retire towards Boileduc. Henry, finding no prospect of being able to relieve the garrison, sent a permission to the governor to surrender on the best conditions he could obtain. This plan, which was signed with no name, fell into the hands of the besiegers, and Spinola sent it open, by a trumpet, to Justin de Nassau, offering him an honourable capitulation; but that intrepid governor, suspecting the letter was forged, because it was anonymous, replied civilly, that a permission was not an order to surrender; and that he should better follow the prince of Orange's intention, and show his respect for Spinola, by continuing to defend the city to the last extremity.

By this time the garrison was diminished by disease, fatigue, want, and hardship, to half the original number; but Justin put on such a countenance, as concealed his situation from Spinola. He frequently sallied out upon Baglioni's quarters, where the Italians were perishing with cold and hunger, the whole subsistence of the besiegers depending on the contributions raised in the neighbouring territories. This inconvenience produced a mutiny in the camp, that could not be appeased without applying violent remedies, and executing within sight of the whole army the chief ringleaders. One of the mutiners blew up Spinola's chief magazine, valued at two hundred thousand livres. Urged more by necessity than compassion for the besieged, Spinola sent a message to the governor, exhorting him not to force him to extremities, which might be attended with fatal consequences to a brave garrison; but Justin, with equal art and dissimulation, answered, that Spinola was certainly ill served by his spies, as he appeared wholly unacquainted with the state of affairs in Breda, which was fully provided for a siege of several months, and defended by soldiers who preferred death to the necessity of surrendering. At that time the besieged were not informed of the death of the prince of Orange. They flattered themselves with the hopes of speedy succour, and were entirely ignorant of prince Henry's late disappointment. When they wrote to the army an account of their miserable condition, Henry returned an answer, written with his own hand, and signed with his name, apprising them of the death of Maurice, the unsuccessful attempts made to raise the siege and throw in succours, the great inferiority of his troops in point of numbers, and the death of king James, whereby he was disappointed of a strong reinforcement; concluding, that he left the city entirely to the discretion of the governor and other principal officers. Justin was thunderstruck with the contents of this letter. He had hitherto concealed the total want of provision and ammunition from the

enemy, and his own garrison, except a few officers and other persons in whom he reposed confidence. The colonels Hauterive and Morgan would listen to no propositions, saying, that the honour of their several countries were concerned, and that they were responsible for the conduct of the English and French forces. They therefore required an express order from the prince of Orange to surrender, notwithstanding they pined under the united pressure of fatigue, famine, and disease. Justin acquainted the prince with their resolution, and he sent back an order to surrender, threatening with capital punishment whoever should disobey; but he requested that the garrison would first acquaint him by a certain number of fires, lighted up in different parts of the city, how many days they should be able to hold out. Upon receipt of this order, eleven fires were kindled; but as the prince had sent a duplicate of the order by another messenger, and this fell into the hands of the enemy, Spinola was now acquainted with the desperate circumstances of the besieged. By this acquisition he likewise discovered the mystery of the eleven fires: a council of war was assembled to deliberate whether they should stay the eleven days, and then oblige the garrison to surrender at discretion, or immediately offer conditions worthy of so brave a garrison. The Spanish officers were of the former opinion; the count de Berg and Spinola supported the latter. At last the marquis, determined to pursue the dictates of his noble generosity, sent such terms as could not be refused. The count de Berg conducted the negotiation. Two separate capitulations were drawn up, one for the garrison and the other for the city, and both the most honourable and advantageous that could be devised. They were accepted, and the garrison marched out on the 6th of June, after having sustained a siege for ten months, whereby they were diminished two-thirds; nor was the loss inferior on the part of the inhabitants. Spinola drew up his army to salute them, and surrounded by his field officers, paid particular compliments to the governor, the colonels Morgan, Hauterive, and Lohre. He distributed money among the soldiers, ordered the sick and wounded to be treated with the utmost tenderness, conveyed the rest in the manner most commodious for them to Gertuydenburgh, and displayed all the sentiments of a hero in the regard paid to the valour and merit of his enemies.

Breda was retaken by the prince of Orange, for the United Provinces, in 1637. There was a congress held there, and peace concluded, in 1667, between the Dutch and the English. E. Long. 4. 45. N. Lat. 51. 35.

BREDA (John Van), painter of history, landscape, and conversations, was born at Antwerp in 1683, the son of Alexander Van Breda, an artist who was much esteemed for landscapes, views of particular scenes in Italy, fairs, and markets, with a variety of animals and figures. He was instructed by his father; and having the advantage of a good example and a good director, added to his own great application, he continued his studies with his father till he was 18 years of age. Among the variety of capital paintings which were at that time in the possession of John de Wit at Antwerp, Breda fixed upon thole of Velvet Brughel, which he copied with extraordinary success; and he was also employed for

Breda.

Breeds
||
Breeches.

nine years in copying the pictures of several other great masters; which he performed with such incredible exactness as scarcely to leave it in the power of any judicious person to distinguish the originals from the copies. Having at length established his reputation in Holland, he went to London with Ryfbrack the sculptor, and there gradually rose into such esteem that he was visited by persons of the highest rank, and particularly patronised by the unfortunate Earl of Derwent-water, who was beheaded for rebellion in 1715. He found so much encouragement in London, that he was employed by the court and the nobility, and could scarce execute the large demands for his performances. After a residence of some years in England, he returned to Antwerp loaded with riches, the honourable testimonies of English liberality, as well as of his own merit; and in the year 1746, when Louis XIV. arrived in that city, he so far honoured this master as to purchase four of his pictures. One represented Christ at the sea of Tiberias; another, Christ performing miracles; and the other two were landscapes, with a number of figures, so exquisitely drawn and finished that it would be difficult to distinguish them from those of Velvet Brueghel. He certainly approached nearer to those great masters whose manner he imitated, namely, Brueghel and Wouwermans, than any other artist of his time. His landscapes are in the style and taste of the former, and his conversations, historical figures, fairs, skirmishes, or battles, are in the manner of the latter. His colouring is good; his touch neat; his skies and distances natural and beautiful; and his taste of design agreeable. He had as much fire in his composition, and perhaps more genius, than Brueghel, in those subjects which he painted in the style of that master; his figures are generally well placed, his grounds skillfully broken; every small figure hath its particular character, and occupies its proper place; and, in short, he is a painter of such a rank, that the value and estimation of his works must always increase. He died in 1750.

BREECH of a great gun, or cannon, the end next the touch-hole.

BREECHES, a garment worn by males, reaching from the girdle to the knees, and serving to cover the hips, thighs, &c.

The ancient Romans had nothing in their dress answering to our breeches and stockings; instead of which, under their lower tunics and waistcoats they sometimes bound their thighs and legs round with silken scarves or fasciæ, called *tibialia* and *femoralia*. Breeches appear to be a habit peculiar to the barbarous nations, especially those inhabiting the colder countries of the north; whence Tacitus calls them *barbarum tegmen*. We find mention made of them among the ancient Getæ, Sarmatæ, Gauls, Germans, and Britons; they also obtained among the Medes and Persians, as being a people of Scythian origin: they also afterwards got footing in Italy, some pretend as early as the time of Augustus; but without much foundation, that emperor's breeches, mentioned by Suetonius, being apparently only swaths tied over his thighs. However this be, breeches were at last received into Italy, and grew so highly into fashion, that it was thought necessary under Honorius and Arcadius, to restrain them by

law, and expel the *bracarii* or breeches-makers out of the city; it being thought unworthy of a nation that commanded the world, to wear the apparel of barbarians.

BREECHINGS, in the sea-language, the ropes with which the great guns are lashed or fastened to the ship's side. They are thus called, because made to pass round the breech of the gun.

BREEDING, in a general sense, the producing, nourishing, and educating, all manner of young animals.

BREEDING, in a moral sense, denotes a person's deportment or behaviour in the external offices and decourments of social life. In this sense we say *well-bred, ill-bred, a man of breeding, &c.* Good-breeding is hard to define; none can understand the speculation but those who have the practice. Good-breeding amounts to much the same with what is otherwise called *pluteness*, among the ancient Romans *urbanity*. Good-breeding is near to virtue, and will of itself lead a man a great part of the way towards the same. It teaches him to rejoice in acts of civility, to seek out objects of compassion, and to be pleased with every occasion of doing them good offices. Lord Shaftesbury compares the well-bred man with the real philosopher: both characters aim at what is excellent, aspire to a just taste, and carry in view the model of what is beautiful and becoming. The conduct and manners of the one are formed according to the most perfect ease, and good entertainment of company; of the other, according to the strictest interest of mankind; the one according to his rank and quality in his private station, the other according to his rank and dignity in nature. Horace seems to have united both characters,

Quid verum atque decens curo et rogo, et omnis in hoc sum.

See the article *Good-MANNERS*.

BREEDING of Horses. See *EQUUS*.

BREEDING of Fish. The necessary qualities of a pond, to make it serve well for breeding fish, are very different from those which are to make it serve for the feeding of them, inasmuch that some particular ponds serve only for one of these purposes, and others for the other; and scarce ever the same pond is found to answer for them both. In general, it is much more rare to find a good breeding pond than a good feeding one. The best indications for a good breeding pond are these; that there be a good quantity of rushes and grass about its sides, with gravelly shoals, such as horse-ponds usually have; when a pond has this property, and takes to the breeding of fish, it is amazing what a progress will be made in a little time. The spawn of fish is prodigious in quantity; and where it succeeds, one is able to produce many millions: thus, in one of these breeding ponds, two or three melters, and as many spawners, will, in a very little time, stock the whole country. When these ponds are not meant entirely for breeding, but the owner would have the fish to grow to some size in them, the method is to thin the numbers, because they would otherwise starve one another, and to put in other fish that will prey upon the young, and thin them in the quickest manner. Eels and perch are the most useful on this account; because they prey not only upon the spawn itself, but upon the young fry from the first hatching to the time they are of a considerable size.

Dillington's

Breechings,
Breeding.

Breenberg or **Brehon**. Some fish are observed to breed indifferently in all kinds of waters, and that in considerable plenty; of this nature are the roach, pike, and perch.

BREENBERG (Bartholomew), an excellent painter, was born in 1620. He is best known by the name of *Bartolomeo*, an appellation bestowed upon him, for distinction sake, by the society of Flemish painters at Rome called *Bentvogels*. He was born at Utrecht; but in the early part of his life went to Rome. His studies in the art of painting were attended with such success, that his pictures were held in the highest estimation. He greatly excelled in landscapes, and these he enriched with historical subjects. The figures and animals which he introduced were very spirited, and drawn in a masterly manner; especially when they were not larger than the size in which he usually painted them. He died 1660, aged 40 years. He also etched from his own designs a set of 24 *Views and Landscapes, ornamented with Ruins*.

BREEZE, a shifting wind that blows from sea or land for some certain hours in the day or night; common in Africa and some parts of the East and West Indies.

Breezes differ from *etefix* or trade-winds, as the former are diurnal, or have their periods each day; and the latter are anniversary, and blow at a distance from land. The sea-breezes rule by day, and the land-breezes by night; so that, dividing their empire, they remain constant as the seasons of the year, or course of the sun, on which they seem to depend: not but that they appear sooner or later, stronger or weaker, in some places than in others; and vary the alternative according to the several latitudes, situations, and soils, &c. of the countries where they are found. See the article **WIND**.

BREEZE-Fly. See **TABANUS**.

BREGENTZ, or **BERGENTZ**, a town of Tyrol in Germany, situated at the east end of the lake of Constance, in E. Long. 9. 40. N. Lat. 47. 36.

BREGMA, in anatomy, the same with *sinuiput*. See **ANATOMY**, B^o 11, 13.

BREHAR, one of the Scilly islands, lying almost directly west of the land's end in Cornwall, about the distance of 30 miles. It lies between the isles of Miscarlo, Guel, Trefcaw, and Samson. It is the roughest and most mountainous of them all, and not many years since, there were only two families in it, but now there are 13. There are a few poor houses, called the *town of Brehar*; and there are several **BARROWS** edged with stone, in which they buried considerable persons in ancient times; besides many monuments of the **DRUIDS**. Some are of opinion, that this with the rest made but one island, which is the reason why so many antiquities are now found in most of them.

BREHONS, the provincial judges among the ancient Irish, by whom justice was administered, and controversies decided. These judges were a distinct tribe or family, to whom competent lands were allowed in inheritance. In criminal cases the brehon had the eleventh part of all the fines; which could not but be considerable at a time when murders, rapes, robberies, and the like offences, were only subject to pecuniary commutations.

BREHON-LAWS, or *Leges Brehonicæ*, denote the general maxims or rules of law observed by the brehons, and having the force of laws throughout all the provinces of Ireland. Several fragments of the *leges*
Vol. III. Part II.

brehonicæ are still extant in public and private libraries. The most complete collection is that belonging to the duke of Chandos; containing 22½ sheets close written, full of abbreviated words, and not very legible. By the statute of Kilkenny, made under Edward III. it is enacted that no English subject shall submit to a trial by the *brehon* law, on the penalty of high treason. Notwithstanding which, many were still under a necessity of being concluded by the Irish laws and customs, till the whole kingdom was settled on an English bottom by king James I.

BREMEGARTON, a handsome and pretty considerable town of Swisserland, in the territory of Fyen-Aempter, between the cantons of Zurich and Bern. The inhabitants deal chiefly in paper; and their religion is the Roman-catholic. It is divided into the upper and larger towns, and is very advantageously seated on the river Rufs. E. Long. 8. 25. N. Lat. 47. 20.

BREMEN, a large, populous, and very strong town of Germany, capital of a duchy of the same name, with an archbishop's see, secularized in favour of the Swedes, but now belongs to the elector of Hanover. The river Weser runs through the middle, and divides it into the old and new town. In September 1739, while the inhabitants were asleep, the magazine of powder was set on fire by lightning; and all the houses were shook, as if there had been a violent earthquake, which threw them into a terrible conflagration. This town is divided into four quarters, each of which has a burgomaster; and in the middle there is a large market-place, with the statue of Rolando. Bremen drives a very large trade for iron, flax, hemp, and linen, with France, England, Spain, and Portugal, and in return takes hack other provisions, with which it supplies Westphalia and the countries about Hanover. It also gets a great deal by its fisheries; the trade for blubber with the south of Germany is very considerable. E. Long. 8. 45. N. Lat. 53. 40.

BREMEN, a duchy of Germany, in the province of Lower Saxony, lying between the rivers Weser and the Elbe; of which the former separates it from the duchy of Oldenburg, and the other from that of Holstein. The air is cold; but the country is fertile, and well peopled. It formerly belonged to the Swedes, but was afterwards sold to the king of Great Britain, as elector of Hanover, in 1716. In the winter it is subject to inundations. In 1617, on Christmas-day, several thousand cattle were drowned, besides several hundred of men; and the country was so covered with water, that it has cost immense sums to repair the dykes. Bremen is the capital town.

BREMEN-Feerd, a town of Germany, in the circle of lower Saxony, and duchy of Bremen. It is an open town, seated on the river Oost, and was formerly the place of residence of the archbishop. E. Long. 8. 35. N. Lat. 53. 58.

BRENNAGE, **BRENNAGIUM**, in middle-age writers, a kind of tribute paid in lieu of bran, or bran itself, which the tenants were obliged to furnish for the support of the lord's hounds. The word is also written *breuage*, *brénarium*, and *brénage*, *brénagium*, *brénaticum*, and *brénaticum*.

BRENNUS, a celebrated captain among the Gauls, who, about 388 years before the Christian æra, entered Italy

Bremegart-

Brennus.

Brent
||
Bresciano.

Italy with a powerful army; made great conquests there; defeated the Romans; and sacked Rome. The capital alone was defended; and Camillus coming to its relief, drove the Gauls not only out of Rome, but out of all Italy. See (*History of*) ROME.

BRENT, a town of Devonshire, with a market on Saturdays, and two fairs, on May 13th and October 10th, for horned cattle. It is but a small place, and lies on the road from Exeter to Plymouth, being 26 miles south-west from the former, and 198 west-by-south of London. W. Long. 5. 7. N. Lat. 50. 30.

BRENT GOOSE, a species of goose with a black neck, and a white collar round; usually confounded with the barnacle, tho' in reality a distinct species. See ANAS.

BRENTFORD, a town of Middlesex, in the great London road to the west. It is divided into old and new Brentford, in which last are the church and market-house, and where the county elections are held. It is a long place, well stocked with public houses, and is seated on the river Thames, in W. Long. 0. 10. N. Lat. 51. 26.

BRENTWOOD, or BURSTWOOD, a town of Essex in England; it stands on a rising ground in the road from London to Colchester, and has several good inns. E. Long. 0. 25. N. Lat. 51. 38.

BREREWOOD (Edward), a very learned English mathematician and antiquary, was the son of Robert Breewood a tradesman, who was thrice mayor of Chester; and born in that city in the year 1565. He was educated in grammar learning at the free school in Chester; and afterwards admitted, in 1581, of Brazen-nose-college in Oxford. In the year 1596, he became the first professor of astronomy in Gresham-college in London; where he led the same private and retired course of life that he had before done in Oxford. He died thereof of a fever, upon the 4th of November 1613, much lamented. He was a great searcher into antiquity and curious knowledge; but is remarkable for having never published any thing during his lifetime. After his death came out the following works. 1. *De ponderibus et pretiis veterum nummorum.* 2. Inquiries touching the diversities of languages and religion through the chief parts of the world. 3. *Elementa logicæ in gratianus scholasticæ juventutis in Acad. Oxon.* 4. *Tractatus quidam logici.* 5. 6. Two treatises on the Sabbath. 7. *Tractatus duo, quorum primus est de meteoris, secundus de oculis.* 8. *Commentarii in ethica Aristotelis.* Mr Wood tells us, that the original manuscript of this, written with his own hand, is in the smallest and neatest characters that his eyes ever beheld; and that it was finished by him on the 27th of October 1586. 9. Patriarchal government of the ancient church.

BRESCIA, a strong and handsome town of Italy, with a bishop's see and a good citadel. It is the capital of Bresciano in the territory of Venice, and is seated in an agreeable plain on the river Garza, in E. Long. 10. 5 N. Lat. 45. 31.

BRESCIANO, a province of Italy in the territory of Venice; bounded on the north, by the Grisons and the bishopric of Trent; on the east, by the lake Garda, the Veronese, and the duchy of Mantua; on the south, by the duchy of Mantua and the Cremonese; and on the west, by the Cremasco, the Burgomasco, and the Valtelina. It is watered by several small rivers, which

render it very fertile; and is full of towns and villages, of which Brescia is the capital.

BRESELLO, a small town in Italy, of the duchy of Modena, seated on the river Po, in E. Long. 10. 25. N. Lat. 44 55.

BRESCICATE, in commerce, a kind of bays, of which there is some trade carried on with the negroes, between the river Gambia and Sierra Leona. The best sorts for that purpose are the blue and the red.

BRESLAU, a small duchy of lower Silesia, in Germany, lying between those of Wolaw, Olise, Brieg, Schwednitz, and Lignitz. It is every where level and flat; is an excellent corn country, yielding also good pasture; abounding also with herds of cattle and flocks of sheep; but destitute of wood, except in one district or circle; and the roads in general are very bad. It is an immediate principality, that is, one of which both the property and jurisdiction belong to the king, forming a part of one of the three bailiwicks into which all the immediate principalities are divided.

BRESLAU, the chief town of the duchy of that name, and of all Silesia, is situated at the conflux of the Oder and Ohlau, in E. Long. 17. 5. N. Lat. 51. 4. Including the suburbs, it is of great extent; having many large regular squares, broad streets, stately public and private edifices; but the fortifications are of no great importance. Here are in particular a great many churches and convents belonging to the catholics; of the former are several also belonging to the Lutherans, one to the Calvinists, and another to the Greeks. The Jews have likewise two synagogues, the bishop a stately palace, and the Lutherans two gymnasiums. The Polish university is a noble structure, nor is the exchange destitute of magnificence. This city is the seat of all the high colleges; and the third in rank, next to Berlin and Konigsberg, in all the Prussian dominions. The magistracy of it is Lutheran, and its trade and manufactures are very considerable. Several of the monasteries and nunneries are very magnificent; and there are also some good public libraries in it, with two armouries, a college of physicians, and a mint. Breslau is very populous, and much frequented by Hungarian, Bohemian, Polish, and other merchants, having several yearly fairs. The city was taken by the king of Prussia in 1741, and retaken by the Austrians in 1757; but the king of Prussia took it back again the same year, and gained a signal victory over the Austrians at Leuthen, a village not far from the capital.

BRESSE, a province of France, bounded on the north, by Burgundy and the Franche Compté; on the east, by Savoy; on the south, by Viennois; on the west, by the principality of Dombes and the Somme. It is 40 miles from north to south, and 23 from east to west. It is fertile in corn and hemp, has fine pastures, and several lakes with plenty of fish. It is divided into the higher and lower; the first is on the side of Bourges, and the second towards St Trivier and the river Sonne. The French got possession of it in 1601. The principal places are Bourgen, Bresse, Montluel, Pont de Vaux, and Coligny.

BRESSICI, in geography. See BRESTE.

BREST, a maritime town of France, in lower Brittany, seated on the declivity of a hill on the side of its port, which is the largest in the kingdom, and will hold

Breslavo

Brest
||
Brethren.

500 ships at a time. There is an arsenal with sea-flores, which was placed there on account of its nearness to the woods, mines of iron, and other things proper for the building of ships. It was entirely consumed by fire in 1744, which was an irreparable loss to France. The entrance into the port is guarded by a strong castle seated on a rock, which cannot be attempted on the sea side, because it is craggy, and is defended on the land side by a large ditch and other fortifications. The streets of Brest are very narrow, ill contrived, few in number, and have all a descent. A great quay surrounds this side of the port, which is above a mile in length, and 200 paces broad; and there are magazines on the quay full of all foreign merchandizes. On the other side of the port the fine church of Notre Dame is situated; and in a suburb, which is as big as half the city, there is a strong tower opposite to the castle, at the entrance of the port; there is also a great quay on this side, bordered with large magazines, partly within the rock, which has been cut away to enlarge the place. These are extended almost as far as the bottom of the harbour, where there are two docks very commodious for the building of large ships: the shops and houses of the workmen are all around them: the ropewalks are separated from the city by one of these docks. The entrance into the harbour is called the *gullet*, and is a passage extremely difficult on account of the sunk rocks on both sides of the shore; but there are experienced pilots who carry ships in very safely. The English attempted to take possession of this harbour in 1694, but were disappointed. W. Long. 4. 26. N. Lat. 48. 23.

BREST, or *Breast*, in architecture, a term sometimes used for the member of a column, more usually called *torus*. See **Torus**.

BREST-Summers, in timber buildings, are pieces in the outward the roof, into which the girders are framed: this, in the ground floor, is called a *coll*; and, in the garret-floor, a *beam*.—As to their size, it is the same with that of girders. See **GIRDERS**.

BRESTE, the palatinate of, is one of the provinces of Cujava, in Poland. It lies between the palatinates of Ploesco, Rava, and Lencici Wladislaw. It is divided into four chatelannies, and Breste is the capital of the whole.

BRESTE, or *Bressici*, the capital of the palatinate of Bressici, and of Polchia, in Poland, seated on the river Bog, 80 miles east of Warsaw, and subject to Poland. It is a fortified town, and has a castle built upon a rock. Here is a famous synagogue, resorted to by the Jews from all the countries in Europe. E. Long. 24. 0. N. Lat. 41. 35.

BRET, a name the people on the coasts of Lincolnshire give to the common turbot, a fish extremely plentiful with them, and taken in vast abundance. The way of catching them is in a net trailed on the ground by two horses; the one going up to the middle of his body in water, the other on shore.

BRETESSE, in heraldry, denotes a line embattled on both sides.

BRETHREN AND SISTERS OF THE FREE SPIRIT, in Ecclesiastical History, an appellation assumed by a new sect which sprung up towards the close of the thirteenth century, and gained many adherents in Italy, France, and Germany. They took their denomina-

tion from the words of St Paul, Rom. chap. viii. ver. 2, 14. and maintained, that the true children of God were invested with the privilege of a full and perfect freedom from the jurisdiction of the law. They were enthusiasts to a degree of distraction, both in their principles and practice. They resembled the *Beghards*, by which name they were sometimes called, in their aspect, apparel, and manner of living. Some of their professed principles resembled those of the Pantheists; for they held, that all things flowed by emanation from God; that rational souls were portions of the Deity, and that the universe was God; and that, by the power of contemplation, they were united to the Deity, and acquired hereby a glorious and sublime liberty, both from the sinful lusts and the common instincts of nature: and hence they conclude, that the person, who was thus absorbed in the abyss of the Deity, became a part of the Godhead, and was the son of God, in the same sense and manner that Christ was, and that he was freed from the obligation of all laws human and divine. They treated with contempt all Christian ordinances, and all external acts of religion, as unsuitable to the state of perfection at which they were arrived. Some of them were honest but deluded enthusiasts; and they endured the torments inflicted upon them by the inquisitors with astonishing calmness and triumph. Others proceeded to the most extravagant licentiousness of conduct. They held their secret assemblies stark naked, and lay in the same beds with their spiritual sisters, and indiscriminately with other women, without the least scruple or hesitation: modesty and decency being, according to their creed, marks of inward corruption. And some of them proceeded still farther, and maintained, that the *divine man*, or believer, could not sin, let his conduct be ever so horrible or atrocious. Many edicts were published against them; but notwithstanding the severities they suffered, they continued till about the middle of the fifteenth century. They were called by several other names, such as Schweltnones, Picards, Adamites, and Turlopins.

BRETHREN and Clerks of the Common Life, a denomination assumed by a religious fraternity towards the latter end of the fifteenth century. They lived under the rule of St Augustin, and were eminently useful in promoting the cause of religion and learning. Their society was first formed, in the preceding century, by Gerard de Groote, a native of Deventer; but did not flourish till about the period above mentioned, when it obtained the approbation of the council of Constance, and became very respectable in Holland, the Lower Germany, and the adjacent provinces. It was divided into two classes; the *lettered brethren* or *clerks*, and the *illiterate*: they lived in separate habitations, but maintained the closest fraternal union. The former applied to the study of polite literature, and the education of youth; whilst the latter were employed in manual labour, and the mechanic arts. They were frequently called *Beghards* and *Lollaris*, by way of reproach.

White BRETHREN, *fratres albi*, were the followers of a leader about the beginning of the fifteenth century, who was arrayed in a white garment; and as they were also clothed in white linen, they were distinguished by this title. Their leader was a priest from the

Brethren.

Breton.

Alps, who carried about a cross, like a standard, and whose apparent sanctity and devotion drew together a number of followers. This deluded enthusiast practised many acts of mortification and penance, endeavoured to persuade the European nations to renew the holy war, and pretended that he was favoured with divine visions. Boniface IX. ordered him to be apprehended and committed to the flames, upon which his followers dispersed.

BRETON, or CAPE-BRITAIN, an island near the eastern continent of North America, lying between 45 and 47 degrees of north latitude. It is separated from Nova Scotia by a narrow strait called *Canso*, and is about 100 miles in length and 50 in breadth. It is surrounded with little sharp-pointed rocks, separated from each other by the waves, above which some of their tops are visible. All its harbours are open to the east, turning towards the south. On the other parts of the coast there are but a few anchoring places for small vessels, in creeks, or between islets. Except in the hilly parts, the surface of the country has but little solidity, being every where covered with a light moss, and with water. The dampness of the soil is exhaled in fogs, without rendering the air unwholesome. In other respects, the climate is very cold; owing either to the prodigious quantity of lakes, which cover above half the island, and remain frozen a long time; or to the number of forests, that totally intercept the rays of the sun; the effect of which is besides decreased by perpetual clouds.

Though some fishermen had long resorted to this island every summer, not more than 20 or 30 had ever fixed there. The French, who took possession of it in August 1713, were properly the first inhabitants. They changed its name into that of *Isle Royale*, and fixed upon Fort Dauphin for their principal settlement. This harbour was two leagues in circumference. The ships came to the very shore, and were sheltered from winds. Forests affording oak sufficient to fortify and build a large city, were near at hand; the ground appeared less barren than in other parts, and the fishery was more plentiful. This harbour might have been rendered impregnable at a trifling expence; but the difficulty of approaching it (a circumstance that had at first made a stronger impression than the advantages resulting from it) occasioned it to be abandoned, after great labour had been bestowed upon the undertaking. They then turned their views to Louisbourg, the access to which was easier; and convenience was thus preferred to security: the fortification of Louisbourg, however, was not begun till 1720.

In the year 1714, some fishermen, who till then had lived in Newfoundland, settled in this island. It was expected that their number would soon have been increased by the Acadians, who were at liberty, from the treaties that had been granted them, to remove with all their effects, and even to dispose of their estates; but these hopes were disappointed. The Acadians chose rather to retain their possessions under the dominion of Britain, than to give them up for any precarious advantage they might derive from their attachment to France. Their place was supplied by some distressed adventurers from Europe, who came over from time to time to Cape Breton, and the number of inhabitants gradually increased to 4000. They were settled at

Breton.

Louisbourg, Fort Dauphin, Port Toulouise, Nerucka, and on all the coasts where they found a proper beach for drying the cod. The inhabitants never applied themselves to agriculture, the soil being unfit for it. They often sowed corn, but it seldom came to maturity; and when it did thrive so much as to be worth reaping, it had degenerated so considerably, that it was not fit for seed for the next harvest. They have only continued to plant a few pot-herbs that are tolerably well tasted, but must be renewed every year from abroad. The poorness and scarcity of pastures has likewise prevented the increase of cattle. In a word, the soil of Cape Breton seemed calculated to invite none but fishermen and soldiers.

Though the island was entirely covered with forests before it was inhabited, its wood has scarce ever been an object of trade. A great quantity, however, of soft wood was found there fit for firing, and some that might be used for timber; but the oak has always been scarce, and the fir never yielded much resin. The peltry trade was a very inconsiderable object. It consisted only in the skins of a few lynxes, elks, musk-rats, wild cats, bears, otters, and foxes both of a red and silver-grey colour. Some of these were procured from a colony of Micmac Indians who had settled on the island with the French, and never could raise more than 60 men able to bear arms. The rest came from St John's, or the neighbouring continent. Greater advantages might possibly have been derived from the coal-mines which abound in the island. They lie in a horizontal direction; and being no more than six or eight feet below the surface, may be worked without digging deep, or draining off the waters. Notwithstanding the prodigious demand for this coal from New England, from the year 1745 to 1749, these mines would probably have been forsaken, had not the ships which were sent out to the French islands wanted ballast. In one of these mines a fire has been kindled, which could never yet be extinguished.

The people of Cape Breton did not send all their fish to Europe. They sent part of it to the French southern islands, on board 20 or 25 ships from 70 to 140 tons burden. Besides the cod, which made at least half their cargo, they exported to the other colonies timber, planks, thin oak-boards, salted salmon and mackerel, train-oil, and sea-coal. All these were paid for in sugar and coffee, but chiefly in rum and molasses. The island could not consume all these commodities. Canada took off but a small part of the overplus; it was chiefly bought by the people of New England, who gave in exchange fruits, vegetables, wood, brick, and cattle. This trade of exchange was allowed; but a smuggling trade was added to it, carried on in flour, and salt fish.

This island, the key of Canada, was attacked by the English in 1745; and the event is of so singular a nature, that it deserves a particular detail. The plan of this first invasion was laid at Boston, and New England bore the expence of it. A merchant named *Pepperel*, who had excited, encouraged, and directed the enterprize, was intrusted with the command of an army of 6000 men, which had been levied for this expedition.

Though these forces, conveyed by a squadron from Jamaica, brought the first news to Cape Breton of the danger that threatened it; though the advantage of a surprize

surprise would have secured the landing without opposition; though they had but 600 regular troops to encounter, and 800 inhabitants hastily armed; the success of the undertaking was still precarious. What great exploits, indeed, could be expected from a militia suddenly assembled, who had never seen a siege or faced an enemy, and were to act under the direction of sea-officers only. These unexperienced troops stood in need of the assistance of some fortunate incident, which they were indeed favoured with in a singular manner.

The construction and repairs of the fortifications had always been left to the care of the garrison of Louisbourg. The soldiers were eager of being employed in these works, which they considered as conducive to their safety, and as the means of procuring them a comfortable subsistence. When they found that those who were to have paid them, appropriated to themselves the profit of their labours, they demanded justice. It was denied them, and they were determined to assert their right. As these depredations had been shared between the chief persons of the colony and the subaltern officers, the soldiers could obtain no redress. Their indignation against these rapacious extortioners rose to such a height, that they despised all authority. They had lived in an open rebellion for six months, when the British appeared before the place.

This was the time to conciliate the minds of both parties, and to unite in the common cause. The soldiers made the first advances; but their commanders mistrook a generosity of which they themselves were incapable. It was firmly believed that the soldiers were only desirous of falling out, that they might have an opportunity of deserting; and their own officers kept them in a manner prisoners, till a defence so ill managed had reduced them to the necessity of capitulating. The whole island shared the fate of Louisbourg, its only bulwark.

This valuable possession, restored to France by the treaty of Aix la Chapelle, was again attacked by the British in 1758. On the 2d of June, a fleet of 23 ships of the line and 18 frigates, carrying 16,000 well disciplined troops, anchored in Gabarus bay, within half a league of Louisbourg. As it was evident it would be to no purpose to land at a great distance, because it would be impossible to bring up the artillery and other necessaries for a considerable siege, it had been attempted to render the landing impracticable near the town. In the prudent precautions that had been taken, the besiegers saw the dangers and difficulties they had to expect; but, far from being deterred by them, they had recourse to stratagem, and while by extending their line they threatened and commanded the whole coast, they landed by force of arms at the creek of Cormorant.

This place was naturally weak. The French had fortified it with a good parapet planted with cannon. Behind this rampart they had posted 2000 excellent soldiers and some Indians. To front they had made such a close hedge with branches of trees, that would have been very difficult to penetrate, even if it had not been defended. This kind of pallisade, which concealed all the preparations for defence, appeared at a distance to be nothing more than a verdant plain.

This would have preserved the colony, had the assail-

ants been suffered to complete their landing, and to advance with the confidence that they had but few obstacles to surmount. Had this been the case, overpowered at once by the fire of the artillery and the small arms, they would infallibly have perished on the shore or in the hurry of embarking; especially as the sea was just then very rough. This unexpected loss might have interrupted the whole project.

But all the prudent precautions that had been taken were rendered abortive by the impetuosity of the French. The English had scarce begun to move towards the shore, when their enemies hastened to discover the snare they had laid for them. By the brisk and hasty fire that was aimed at their boats, and still more by the premature removal of the bougis that masked the forces, which it was so much the interest of the French to conceal, they guessed at the danger they were going to rush into. They immediately turned back, and saw no other place to direct their landing but a rock, which had been always deemed inaccessible. General Wolf, though much taken up in re-embarking his troops, and sending off the boats, gave the signal to major Scot to repair thither. That officer immediately removed to the spot with his men. His own boat coming up first, and sinking at the very instant he was stepping out, he climbed up the rock alone. He was in hopes of meeting with 100 of his men who had been sent thither some hours before. He found only ten. With these few, however, he gained the summit of the rock. Ten Indians and 60 Frenchmen killed two of his men, and mortally wounded three. In spite of his weakness, he stood his ground under cover of a thicket, till his brave countrymen, regardless of the boisterous waves and the fire of the cannon, came up to him, and put him in full possession of that important post, the only one that could secure their landing. The French, as soon as they saw that the enemy had got a firm footing on land, betook themselves to the only remaining refuge, and shut themselves up in Louisbourg. The fortifications were in a bad condition, because the sea sand, which they had been obliged to use, is by no means fit for works of masonry. The revetments of the several curtains were entirely crumbled away. There was only one casemate and a small magazine that were bomb-proof. The garrison which was to defend the place consisted only of 2900 men.

Notwithstanding all these disadvantages, the besieged were determined to make an obstinate resistance. It is scarce credible that the French were confirmed in their resolution by the courage of a woman. Madame de Ducaout was continually upon the ramparts, with her pike in her hand; and firing herself three guns every day, seemed to dispute with the governor her husband the glory of his office. The besieged were not dismayed at the ill success of their several sallies, or the masterly operations concerted by Admiral Boscawen and general Amherst. It was but at the eye of an assault, which it was impossible to sustain, that they talked of surrendering. They made an honourable capitulation; and the conqueror showed more respect for his enemy and for himself, than to tully his glory by any act of barbarity or avarice.—The possession was confirmed to Great Britain by the peace 1763; since which the fortifications have been blown up and the town of Louisbourg dismantled.

Brettigaw
||
Breugel.

BRETTIGAW, a territory or valley of the Grisons, lying between the Rhine and the county of Tyrol, and along the river Lanquet. The fortress of Castels is the principal town.

BREVE, in law, is any writ directed to the chancellor, judges, sheriffs, or other officers, whereby a person is summoned, or attached, to answer in the king's court, &c.

BREVE Perquirere, the purchasing of a writ or licence for trial in the king's courts; whence comes the present use of paying 6s. 8d. fine to the king in suit, for money due on bond, where the debt is L. 40, and of 10 s. where it is L. 100, &c.

BREVE de Recto, is a writ of right or licence, for a person ejected, to sue for the possession of the estate detained from him.

BREVE, in music, a note or character of time, in the form of a diamond or square, without any tail, and equivalent to two measures or minims.

BREVET, in the French customs, denotes the grant of some favour or donation from the king; in which sense it partly answers to our warrant, and partly to letters-patent.

BREVET, more particularly denotes the commission of a subaltern officer, being only written on parchment, and without seal. A brevet officer is one whose rank in the army is above his pay: for instance, a brevet major serves only as a captain, and receives pay as such.

BREUGEL (Peter), an eminent painter, commonly called *Old Breugel*, to distinguish him from his son, was born at a village of the same name near Breda, in the year 1565; and was the first pupil of Peter Cock, whose daughter he married. It was customary with him to dress like a country-man, in order to be more easily admitted into the company of country-people, and be allowed to join in their frolics, by which means he became perfectly acquainted with their manners and gestures, of which he made excellent use in his pictures. He travelled to France and Italy, and for a long time studied landscapes on the mountains of Tyrol. His humorous turn of mind displayed itself in all his pictures, which generally consisted of country dances, marriages, sports, and diversions; though he sometimes performed pieces from the historical parts of the holy Scriptures. At his return from Italy, he settled at Antwerp, and in his last illness caused his wife to gather together all his immodest pieces and burn them before his face. He died at Antwerp about the year 1570. Of the works of old Breugel, the great duke of Tuscany has, Christ carrying his cross, with a great number of figures; and a country feast. The emperor has the tower of Babel, the massacre of the Innocents, and the conversion of St Paul, of his painting: the elector Palatine, a landscape, with St Philip baptizing queen Candace's eunuch; and St John preaching in the wilderness, with a great many figures. Old Breugel also, for his amusement, is said to have engraved some few plates of landscapes and grotesque subjects.

BREUGEL (Peter), the younger, was the son of the above-mentioned artist, and named *Hellish Breugel*, from the horrible subjects he delighted to represent. He engraved also, according to M. Heineken; but his works are not specified. He died 1642.

BREUGEL (John), commonly called *Velvet Breugel*,

from his generally wearing velvet clothes, was the son of Peter Breugel, and born about the year 1575. He first applied himself to painting flowers and fruit, in which he excelled; and afterwards had great success in drawing landscapes, and views of the sea, set off with small figures. He lived long at Cologne, where he acquired great reputation. He travelled to Italy, where his fame had got before him; and where his fine landscapes, adorned with small figures superior to those of his father, gave very great satisfaction. If a good judgment may be formed from the great number of pictures he left behind him, all highly finished, he must have been exceedingly industrious. Nor did he satisfy himself with embellishing his own works only, but was very useful in this respect to his friends. Even Rubens made use of Breugel's hand in the landscape part of several of his small pictures, such as his Vertumnus and Pomona; the satyr viewing the sleeping nymph; and the terrestrial paradise, which is looked upon as his master-piece. He died in 1642.

—Several of his works are to be seen in the archbishop's gallery at Milan; particularly a hunting-piece with a vast many figures; a landscape representing a desert, with the picture of St Hierom painted by Cerano, alias Gro Baptista Crespi. In the Ambrosian library are 20 pieces of this masterly hand; particularly Daniel in the lion's den, the inside of the great church at Antwerp, the four seasons on copper, and the burning of Gomorriha. In the possession of the elector Palatine at Dusseldorp, Christ preaching on the sea-shore; a country-dance; a sea-port, with a great many figures; a coach and two chariots, with a multitude of figures and animals; a landscape, wherein Flora is crowned by a nymph; St John preaching in the wilderness; a small sea-landscape, and several other pieces. In the possession of the king of France, a woman playing with a dog, the battle between Alexander and Darius, both in wood; Orpheus in hell, &c.

BREVIARY, a daily office, or book of divine service, in the Romish church. It is composed of matins, lauds, first, third, sixth, and ninth vespers, and the complete or post communion.

The breviary of Rome is general, and may be used in all places; but on the model of this various others have been built, appropriated to each diocese, and each order of religious.

The breviary of the Greeks is the same in almost all churches and monasteries that follow the Greek rites: the Greeks divide the psalter into 20 parts. In general, the Greek breviary consists of two parts; the one containing the office for the evening, the other that of the morning, divided into matins, lauds, first, third, sixth, and ninth vespers, and the complies; that is, of seven different hours, on account of that saying of David, *Septies in die laudem dixi tibi*.

The institution of the breviary is not very ancient: there have been inserted in it the lives of the saints, full of ridiculous and ill-attested stories, which gave occasion to several reformations of it, by several councils, particularly those of Trent and Cologne; by several popes, particularly Pius V. Clement VIII. and Urban VIII.; and also by several cardinals and bishops, each lopping off some extravagances, and bringing it nearer to the simplicity of the primitive offices. Originally, every body was obliged to recite the breviary every day; but

Breugel,
Breviary.

Breviator
||
Brewer.Brewer,
Brewing.

by degrees the obligation was reduced to the clergy only, who are enjoined, under penalty of mortal sin and ecclesiastical censures, to recite it at home, when they cannot attend in public. In the 14th century, there was particular reserve granted in favour of bishops, who were allowed, on extraordinary occasions, to pass three days without rehearsing the breviary.

This office was originally called *curfus*; and afterwards, the *breviarum*: which latter name imports that the old office was abridged; or rather, that this collection is a kind of abridgement of all the prayers.

The breviaries now in use are innumerable; the difference between them consists principally in the number and order of the psalms, hymns, paternosters, ave-Maries, creeds, magnificates, cantemus's, benedictus's, canticamus's, nunc dimittis's, miserere's, ballehjah's, gloria patri's, &c.

BREVIARY, in Roman antiquity, a book first introduced by Augustus, containing an account of the application of the public money.

BREVIATOR, an officer under the eastern empire, whose business it was to write and translate briefs.—At Rome those are styled *breviators*, or *abbreviators*, who dictate and draw up the pope's briefs.

BREVIBUS A ROTULIS LIBERANDIS, a writ or command to a sheriff to deliver to his successor the county, with the appurtenances, and the rolls, writs, and other things to his office belonging.

BREVIER, among printers, a small kind of type or letter between bourgeois and minion.

BREVITY, in a general sense, that which denominates a thing brief or short.

BREVITY is more particularly used in speaking of the style or composition of discourse. Brevity of discourse is by some called *brachylogia* and *breviloquentia*; sometimes *laconismus*. Tacitus and Perius are remarkable for the brevity of their style. There are two kinds of brevity, one arising from dryness, poverty, and narrowness of genius; the other from judgment and reflection; which latter alone is laudable. Brevity is so essential to a tale, a song, and an epigram, that without it they necessarily languish and become dull. Rhetoricians make brevity one of the principal marks or conditions of eloquence; but the rules they prescribe for attaining it, are difficult to apply, so as still to keep the due medium between too much and too little. A just brevity is attained by using all the words which are necessary, and none but those which are necessary. Sometimes it may also be had, by choosing a word which has the force of several. It is this last kind which Quintilian admires so much in Sallust; and the imitation of which, by other writers, has caused so much obscurity.

BREVIUM CUSTOS. See CUSTOS.

BREVORDI, a town of Guelderland, in the United Netherlands, situated in E. Long. 6. 35. N. Lat. 52°.

BREWER (Anthony), a dramatic poet who flourished in the reign of king Charles I. and appears to have been held in high estimation by the wits of that time, as may be more particularly gathered from an elegant compliment paid to him in a poem called *Steps to Parvassur*, wherein he is supposed to have a magic power to call the muses to his assistance, and is even set on an equality with the immortal Shakespeare him-

self. There are, however, great disputes among the several writers as to the number of his works. Those which have been ascribed to him with any certainty are, 1. *The country girl*, a comedy. 2. *The love-sick king*, a comedy. And, 3. *Lingua*: a piece in regard to which Winstanley records a remarkable anecdote, which points it out to have been in some measure the innocent cause of those troubles that disturbed the peace of these realms in the middle of the 17th century. He tells us, that when this play was acted at Cambridge, Oliver Cromwell (then a youth) acted a part in it. The substance of the piece is a contention among the Senses for a crown which *Lingua* had laid for them to find. The part allotted to young Cromwell was that of *Tactus* or *Touch*; who having obtained the contested coronet, makes this spirited declamation:

Roses and bays, pack hence! this crown and robe
My brows and body circles and invests:
How gallantly it fits me! sure the slave
Measur'd my head who wrought this coronet.—
They lie that say complexions cannot change!
My blood's ennobled, and I am transform'd
Unto the sacred temper of a king.
Methinks I hear my noble parasites
Styling me *Cæsar*, or *Great Alexander*,
Licking my feet, &c.

It is said that he felt the whole part so warmly, and more especially the above-quoted speech, that it was what first fired his soul with ambition, and excited him from the possession of an imaginary crown to stretch his views to that of a real one; for the accomplishment of which he was content to wade through seas of blood.

BREWER, a person who professes the art of brewing.

There are companies of brewers in most capital cities; that of London was incorporated in 1427 by Henry VI. and that of Paris is still older.

The apparatus and utensils of a brewer, or a brew-house, are, A furnace made close and hollow for saving fuel, and with a vent for the smoke lest it taint the liquor; a copper, which is preferable to lead; a malk-vat near the head; a cooler near the malk-vat; and a guile-vat under the cooler: adjoining to all are several clean tubs, to receive the worts and liquors.

BREWERS-HAVEN, a good harbour at the north end of the island of Chiloe on the coast of Chili, in South America, and in the South Sea. The Dutch landed forces here in 1643, deliquing to get possession of some part of Chili; but they were driven from thence by the Spaniards and the natives. W. Long. 82. S. Lat. 42.

BREWING, the operation of preparing ale or beer, from MALT.

Though the art of brewing is undoubtedly a part of chemistry, and certainly depends upon fixed and inviolable principles as well as every other branch of that science, these principles have never yet been thoroughly investigated. For want of a settled theory, therefore, the practice of this art is found to be precarious; and to succeed unaccountably with some, and misgive as unaccountably with others. Some few hints, however, have been thrown out, in order to establish a regular theory of brewing; the principal of which we shall lay before our readers.

The usual process of brewing is as follows: A quantity

city

Brewing.

2
Common
proefs de-
scribed.

tity of water being boiled, is left to cool till the height of the steam be over; when so much is poured to a quantity of malt in the mashing tub, as makes it of a consistence stiff enough to be just well rowed up: after standing thus a quarter of an hour, a second quantity of the water is added, and rowed up as before: lastly, the full quantity of water is added; and that in proportion as the liquor is intended to be strong or weak.—This part of the operation is called *mashing*.—The whole now stands two or three hours, more or less, according to the strength of the wort or the difference of weather, and is then drawn off into a receiver; and the mashing repeated for a second wort, in the same manner as for the first, only the water must be cooler than before, and must not stand above half the time. The two worts are then to be mixed, the intended quantity of hops added, and the liquor close covered up, gently boiled in a copper for the space of an hour or two; then let into the receiver, and the hops strained from it into the coolers. When cool, the barm or yeast is applied; and it is left to work or ferment till it be fit to tun up. For small beer there is a third mashing with the water near cold, and not left to stand above three quarters of an hour; to be hopped and boiled at discretion. For double beer or ale, the liquors resulting from the two first mashings must be used as liquor for a third mashing of fresh malt.

3
Difficulties
attending it.

From considering this process, and the multiplicity of circumstances to be attended to in it, we may easily see that it must be a very precarious one. The success of the operation, *i. e.* the goodness of the beer, must depend upon the quality of the malt from which it is made; on that of the water with which it is infused; on the degree of heat applied in the infusion; on the length of time the infusion is continued; on the proper degree of boiling, the quantity and quality of the hops employed; on the proper degree of fermentation, &c.: all which, as already observed, have never yet been thoroughly investigated and ascertained.

4
Sir Robert
Murray's
method of
malt-ma-
king.

The manner of making malt Sir Robert Murray describes as follows.—Take good barley newly threshed, &c.; put about six English quarters in a stone trough full of water, where let it steep till the water be of a bright reddish colour; which will be in about three days, more or less, according to the moisture or dryness, smallness or bigness, of the grain, the season of the year, or the temperature of the weather. In summer, malt never makes well; in winter it requires longer steeping than in spring or autumn. It may be known when it is steeped enough by other marks besides the colour of the water; as by the excessive swelling of the grain if it be over-steeped, and by too much softness; being, when it is in a right temper, like the barley prepared to make broth of. When it is sufficiently steeped, take it out of the trough, and lay it in heaps to let the water drain from it; then, after two or three hours, turn it over with a scoop, and lay it in a new heap, 20 or 24 inches deep. This is called the *coming heap*, in the right management whereof lies the principal skill. In this heap it may lie 40 hours, more or less, according to the forementioned qualities of the grain, &c. before it come to the right temper of malt; which that it may do equally, is mainly desired. While it lies in this heap, it must be carefully looked to after the first 15 or 16 hours: for about that time the grains

N^o 54.

begin to put forth roots; which when they have equally and fully done, the malt must, within an hour after, be turned over with a scoop; otherwise the grains will begin to put forth the blade and spike also, which must by all means be prevented. If all the malt do not come equally, but that which lies in the middle, being warmest, come the soonest; the whole must be turned, so that what was outmost may be inmost; and thus it is managed till it be all alike. As soon as the malt is sufficiently come, turn it over, and spread it to a depth not exceeding five or six inches; and by that time it is all spread out, begin and turn it over again three or four times. Afterwards turn it over in like manner once in four or five hours, making the heap deeper by degrees; and continue to do so for the space of 48 hours at least. This frequent turning it over, cools, dries, and deadens the grain; whereby it becomes mellow, melts easily in brewing, and separates entirely from the husk. Then throw up the malt into a heap as high as you can; where let it lie till it grow as hot as your hand can endure it, which usually happens in about the space of 30 hours. This perfects the sweetness and mellowness of the malt. After it is sufficiently heated, throw it abroad to cool, and turn it over again about six or eight hours after; and then lay it on a kiln with a hair-cloth or wire spread under it; where, after one fire which must last 24 hours, give it another more slow, and afterwards, if need be, a third: for if the malt be not thoroughly dried, it cannot be well ground, neither will it dissolve well in the brewing; but the ale it makes will be red, bitter, and unfit for keeping.

From this account of the process of malting, it appears, that, besides the proper management in wetting, turning, &c. the drying is an article of the utmost consequence; and concerning the proper degrees of heat to be employed for this purpose, M. Combrune has related the following experiments. “In an earthen pan, of about two feet diameter, and three inches deep, I put as much of the palest malts, very unequally grown, as filled it on a level to the brim. This I placed over a little charcoal lighted in a small stove, and kept continually stirring it from bottom to top; at first it did not feel so damp as it did about half an hour after.

“In about an hour more, it began to look of a bright orange colour on the outside, and appeared more swelled than before. Every one is sensible how long-continued custom alone makes us sufficient judges of colours. Then I macerated some of the grains, and found they were nearly such as are termed *brown malts*. On stirring and making a heap of them towards the middle, I placed therein at about half depth the bulb of my thermometer, and found it rose to 140 degrees: here the malt felt very damp, and had but little smell.

“At 165 degrees I examined it in the same manner as before, and could perceive no damp: the malt was very brown; and, on being macerated, some few black specks appeared.

“Now many corns, nearest the bottom, were become black and burnt: with all the diligence I could use, I placed my thermometer nearly there, and it rose to 175 degrees. But the particles of fire, arising from the stove, act on the thermometer in proportion to the distance of the situation it is placed in; for which,

1

through

Brewing.

5
Mr Com-
brune's ex-
periments
on the dry-
ing of malt;
*Essay on
Brewing.*

rewing. through the whole experiment, an abatement of 5 degrees should be allowed, as near as I could estimate; so, a little after, putting my thermometer in the same position, where nearly half the corns were black, it showed 180 degrees. I now judged that the water was nearly all evaporated, and the heap grew black apace.

“ Again, in the centre of the heap raised in the middle of the pan, I found the thermometer at 180 degrees; the corn tasted burnt; and the whole, at top, appeared about one half part a full brown, the rest black: on being macerated, still some white specks appeared; which I observed to proceed from those barley-corns which had not been thoroughly germinated, and whose parts cohering more together, the fire, at this degree of heat, had not penetrated them: their taste was insipid, the malts brittle, and readily parting from the skin: but the thermometer was now more various, as it was nearer to or farther from the bottom; and here I judged all the true malt to be charred.

“ However, I continued the experiment; and, at 190 degrees, still found some white specks on macerating the grain; the acrospire always appearing of a deeper black or brown than the outward skin: the corn now fried at the bottom of the pan.

“ I next increased the fire; the thermometer, placed in the mean between the bottom of the pan and the upper edge of the corn, showed 210 degrees. The malt hissed, fried, and smoked abundantly; though, during the whole process, the grain had been kept stirring, yet, on examination, the whole had not been equally affected with the fire. I found a great part thereof reduced to perfect cinders, easily crumbling to dust between the fingers, some of a very black hue without gloss, some very black with oil shining on the outside. Upon the whole, two third parts of the corn were perfectly black; the rest were of a deep brown, more or less so, as they were hard, steely, or imperfectly germinated; which was easily discovered by the length of the shoot. Most of them seemed to have lost their cohesion, and had a taste resembling that of high roasted coffee.

“ In the last stage of charring the malt, I set thereon a wine-glass inverted, into which arose a pinguious oily matter, which tasted very salt. Perhaps it may not be unnecessary to say, that the length of time this experiment took up was four hours, and that the effect it had both on myself and the person who attended me was such as greatly resembled the case of inebriation.

“ Though, from hence, it is not possible to fix the exact degree of heat in which malts char, yet we see some black appeared when the thermometer was at 165 degrees, that some were entirely black at 175 and at 180 degrees, that the grains thus affected were such as had been perfectly germinated, and that those which bore a greater heat were defective in that point; whence we may conclude with an exactness that will be sufficient for the purposes of brewing, that true germinated malts are charred in heats between 175 and 180 degrees; and that, as these correspond to the degrees in which pure alcohol, or the finest spirit of the grain itself boils, or disengages itself therefrom, they may point out to us the reason of barley being the fittest grain for the purposes of brewing.”

Vol. III. Part II.

From these experiments, our author has constructed the following table of the different degrees of the dryness of malt, with the colour occasioned by each degree.

Deg.	
119	White.
124	Cream colour.
129	Light yellow.
134	Amber colour.
138	High amber.
143	Pale brown.
148	Brown.
152	High brown.
157	Brown inclining to black.
162	High brown speckled with black.
167	Blackish brown with black specks.
171	Colour of burnt coffee.
176	Black.

“ The above table (says he) not only shows us how to judge of the dryness of malt from its colour, but also, when a grit is composed of several sorts of malt, what effect the whole will have when blended together by extraction; and although possibly some small errors may arise in judgments thus formed by our senses, yet as malts occupy different volumes in proportion to their dryness in the practice of brewing, if the result of the water coming in contact with the malt show the degree expected, such parcel of malt may be said to have been judged of rightly in the degree of dryness it was estimated to; so that the first trial either confirms, or sets us numerically right as to our opinion thereof.”

It is found by experience, that the less heat employed in drying the malt, the shorter time will be required before the beer is fit to be used; and of this our author has given the following table.

Deg.		Deg.	
119	2 weeks.	143	6 months.
124	a month.	148	10 months.
129	3 months.	152	15 months.
134	4 months.	157	20 months.
138	6 months.	162	two years.

Lastly, Mr Combrune hath given the following table showing the tendency beers have to become fine, when properly brewed from malts of different degrees of dryness.

Deg.	Colour of malt.	
119	White.	These, when properly brewed, become spontaneously fine, even as far as 138°; when brewed for amber by repeated fermentations, they become pellucid.
124	Cream colour.	
129	Light yellow.	
134	Amber colour.	
138	High amber.	By precipitation these grow bright in a short time.
143	Pale brown.	
148	Brown.	With precipitation these require 8 or 10 months to be bright.
152	High brown.	
157	Brown inclining to black.	With precipitation these may be fined, but will never become bright.
162	Brown speckled with black.	
167	Blackish brown speckled with black.	These with difficulty can be brewed without setting the goods, and will by no means become bright, not even with the strongest acid menstruum.
171	Colour of burnt coffee.	
176	Black.	

Brewing.

6
Mr Rich-
ardson's ob-
servations.

In a pamphlet entitled "Theoretic hints on an improved practice of brewing malt-liquors, &c. by John Richardson," we have the following observations on the nature and properties of malt.

"The process of making malt is an artificial or forced vegetation, in which the nearer we approach the footsteps of nature in her ordinary progress, the more certainly shall we arrive at that perfection of which the subject is capable. The farmer prefers a dry season to sow his corn in, that the common moisture of the earth may but gently insinuate itself into the pores of the grain, and thence gradually dispose it for the reception of the future shower, and the action of vegetation. The maltster cannot proceed by such slow degrees, but makes an immersion in water a substitute for the moisture of the earth, where a few hours infusion is equal to many days employed in the ordinary course of vegetation; and the corn is accordingly removed as soon as it appears fully saturated, lest a solution, and consequently a destruction, of some of its parts, should be the effect of a longer continuance in water, instead of that separation which is begun by this introduction of aqueous particles into the body of the grain.

"Were it to be spread thin after this removal, it would become dry, and no vegetation would ensue; but being thrown into the couch, a kind of vegetative fermentation commences, which generates heat, and produces the first appearance of germination. This state of the barley is nearly the same with that of many days continuance in the earth after sowing: but being in so large a body, it requires occasionally to be turned over, and spread thinner; the former to give the outward parts of the heap their share of the required warmth and moisture, both of which are lessened by exposure to the air; the latter to prevent the progress of the vegetative to the putrefactive fermentation, which would be the consequence of suffering it to proceed beyond a certain degree.

"To supply the moisture thus continually decreasing by evaporation and consumption, an occasional but sparing sprinkling of water should be given to the floor, to recruit the languishing powers of vegetation, and imitate the shower upon the corn field. But this should not be too often repeated; for, as in the field, too much rain, and too little sun, produce rank stems and thin ears, so here would too much water, and of course too little dry warmth, accelerate the growth of the malt, so as to occasion the extraction and loss of such of its valuable parts, as by a slower process would have been duly separated and left behind.

"By the slow mode of conducting vegetation here recommended, an actual and minute separation of the parts takes place. The germination of the radicles and acrospire carries off the cohesive properties of the barley, thereby contributing to the preparation of the saccharine matter, which it has no tendency to extract or otherwise injure, but to increase and meliorate, so long as the acrospire is confined within the husk; and by how much it is wanting of the end of the grain, by so much does the malt fall short of perfection, and in proportion as it has advanced beyond, is that purpose defeated.

"This is very evident to the most common observation, on examining a kernel of malt in the different

stages of its progress. When the acrospire has shot but half the length of the grain, the lower part only is converted into that yellow saccharine flour we are solicitous about, whilst the other half affords no other signs of it than the whole kernel did at its first germination. Let it advance to two thirds of the length, and the lower end will not only have increased its saccharine flavour, but will have proportionally extended its bulk, so as to have left only a third part unmalted. This, or even less than this, is contended for by many maltsters, as a sufficient advance of the acrospire, which they say has done its business as soon as it has passed the middle of the kernel. But we need seek no further for their conviction of error, than the examination here alluded to.

"Let the kernel be slit down the middle, and tasted at either end, whilst green; or let the effects of mastication be tried when it is dried off; when the former will be found to exhibit the appearances just mentioned, the latter to discover the unwrought parts of the grain, in a body of stony hardness, which has no other effect in the mash-tun than that of imbibing a large portion of the liquor, and contributing to the retention of those saccharine parts of the malt which are in contact with it; whence it is a rational inference, that three bushels of malt, imperfect in this proportion, are but equal to two of that which is carried to its utmost perfection. By this is meant the farthest advance of the acrospire, when it is just bursting from its confinement, before it has effected its enlargement. The kernel is then uniform in its internal appearance, and of a rich sweetness in flavour, equal to any thing we can conceive obtainable from imperfect vegetation. If the acrospire be suffered to proceed, the mealy substance melts into a liquid sweet, which soon passes into the blade, and leaves the husk entirely exhausted.

"The sweet thus produced by the infant efforts of vegetation, and lost by its more powerful action, revives and makes a second appearance in the stem, but is then too much dispersed and altered in its form to answer any of the known purposes of art.

"Were we to inquire, by what means the same barley, with the same treatment, produces unequal portions of the saccharine matter in different situations, we should perhaps find it principally owing to the different qualities of the water used in malting. Hard water is very unfit for every purpose of vegetation, and soft will vary its effects according to the predominating qualities of its impregnations. Pure elementary water is in itself supposed to be only the vehicle of the nutriment of plants, entering at the capillary tubes of the roots, rising into the body, and there dispersing its acquired virtues, perspiring by innumerable fine pores at the surface, and thence evaporating by the purest distillation into the open atmosphere, where it begins anew its round of collecting fresh properties, in order to its preparation for fresh service.

"This theory leads us to the consideration of an attempt to increase the natural quantity of the saccharum of malt by adventitious means; but it must be observed on this occasion, that no addition to water will rise into the vessels of plants, but such as will pass the filter; the pores of which appearing somewhat similar to the fine strainers or absorbing vessels employed by nature in her nicer operations, we by analogy conclude, that

Brewing.

ewing. that properties so intimately blended with water as to pass the one, will enter and unite with the œconomy of the other, and *vice versa*.

“Supposing the malt to have obtained its utmost perfection, according to the criterion here inculcated, to prevent its farther progress and secure it in that state, we are to call in the assistance of a heat sufficient to destroy the action of vegetation, by evaporating every particle of water, and thence leaving it in a state of preservation, fit for the present or future purpose of the brewer.

“Thus having all its moisture extracted, and being by the previous process deprived of its cohesive property, the body of the grain is left a mere lump of flour, so easily divisible, that, the husk being taken off, a mark may be made with the kernel, as with a piece of soft chalk. The extractible qualities of this flour are, a saccharum closely united with a large quantity of the farinaceous mucilage peculiar to bread corn, and a small portion of oil enveloped by a fine earthy substance, the whole readily yielding to the impression of water applied at different times and different degrees of heat, and each part predominating in proportion to the time and manner of its application.

“In the curing of malt, as nothing more is requisite than a total extrication of every aqueous particle, if we had in the season proper for malting, a solar heat sufficient to produce perfect dryness, it were practicable to reduce beers nearly colourless; but that being wanting, and the force of custom having made it necessary to give our beers various tinctures and qualities resulting from fire, for the accommodation of various tastes, we are necessitated to apply such heats in the drying as shall not only answer the purpose of preservation, but give the complexion and property required.

“To effect this with certainty and precision, the introduction of the thermometer is necessary; but the real advantages of its application are only to be known by experiment, on account of the different construction of different kilns, the irregularity of the heat in different parts of the same kiln, the depth of the malt, the distance of the bulb of the thermometer from the floor, &c. &c. for though similar heats will produce similar effects in the same situation, yet is the dispersion of heat in every kiln so irregular, that the medium spot must be found for the local situation of the thermometer ere a standard can be fixed for ascertaining effects upon the whole. That done, the several degrees necessary for the purposes of porter, amber, pale beers, &c. are easily discovered to the utmost exactness, and become the certain rule of future practice.

“Though custom has laid this arbitrary injunction of variety in our malt liquors, it may not be amiss to imitate the losses we often sustain, and the inconveniences we combat, in obedience to her mandate.

“The further we pursue the deeper tints of colour by an increase of heat beyond that which simple preservation requires, the more we injure the valuable qualities of the malt. It is well known that scorched oils turn black, and that calcined sugar assumes the same complexion. Similar effects are producible in malts, in proportion to the increase of heat, or the time of their continuing exposed to it. The parts of the whole being so united by nature, an injury cannot be done to the one, without affecting the other; accordingly

we find, that such parts of the subject, as might have been severally extracted for the purposes of a more intimate union by fermentation, are, by great heat in curing, burnt and blended so effectually together, that all discrimination is lost, the unfermentable are extracted with the fermentable, the integrant with the constituent, to a very great loss both of spirituousity and transparency. In paler malts, the extracting liquor produces a separation which cannot be effected in brown, where the parts are so incorporated, that unless the brewer is very well acquainted with their several qualities and attachments, he will bring over, with the burnt mixture of saccharine and mucilaginous principles, such an abundance of the scorched oils, as no fermentation can attenuate, no precipitants remove; for, being in themselves impediments to the action of fermentation, they lessen its efficacy, and being of the same specific gravity with the beer, they remain suspended in, and incorporated with the body of it, an offence to the eye, and a nausea to the palate to the latest period.”

The next consideration is the quality of the water to be employed in brewing; and here soft water is universally allowed to be preferable to hard, both for the purposes of mashing and fermentation. Transparency is, however, more easily obtained by the use of hard than soft water: first, from its inaptitude to extract such an abundance of that light mucilaginous matter, which, floating in the beer for a long time, occasions its turbidity; secondly, from its greater tendency to a state of quietude after the vinous fermentation is finished, by which those floating particles are more at liberty to subside; and, lastly, from the mutual aggregation of the earthy particles of the water with those of the materials, which by their greater specific gravity thus aggregated, not only precipitate themselves, but carry down also that lighter mucilage just mentioned. For these reasons, hard water is not well adapted to the brewing of porter, and such beers as require a fulness of palate, when drawn to the great lengths of the London brewery, and of some country situations.

The purity of water is determined by its lightness; and in this, distilled water only can claim any material degree of perfection. Rain water is the purest of all naturally produced: but by the perpetual exhalations of vegetables, and other fine substances floating in the atmosphere, it does not come down to us entirely free from those qualities which pond and river waters possess in a greater degree. These, especially of rivers running through fens and morasses, from the quantity of grass and weeds growing therein, imbibe an abundance of vegetable solutions which occasions them to contain more fermentable matter, and consequently to yield a greater portion of spirit; but at the same time induces such a tendency to acidity as will not easily be conquered. This is more to be apprehended towards the latter end of the summer than at any other time; because these vegetable substances are then in a state of decay, and thence more readily impart their pernicious qualities to the water which passes over them.

At such an unfavourable time, should the brewer be necessitated to pursue his practice, it will behove him to pay the utmost attention to the cause of this

Brewing.

Quality of the water to be employed in brewing.

Brewing. disposition in his liquor, and thence endeavour to prevent the ill consequences, by conducting his process to the extraction and combination of such parts of the materials as his judgment informs him will best counteract its effects.

Where there is the liberty of choice, we would recommend the use of that water which, from natural purity, equally free of the austerity of imbibed earths, and the rankness of vegetable saturation, has a soft fulness upon the palate, is totally flavourless, inodorous, and colourless; whence it is the better prepared for the reception and retention of such qualities as the process of brewing is to communicate and preserve.

The next thing to be considered is the proper degree of heat to be employed in making the infusion: and here it is evident, that though this must be an object of the utmost importance to the success of the operation, it is extremely difficult, perhaps impossible, to fix upon a precise standard that shall at all times fully answer the purpose. On this subject Mr Richardson presents us with the following observations.

6
Mr Richardson's observations on the degree of heat.

"The quality of the saccharine part of malt resembles that of common sugar, to which it is practicable to reduce it; and its characteristical properties are entirely owing to its intimate connection with the other parts of the malt, from which such distinguishing flavours of beers are derived as are not the immediate result of the hop. Were it not for these properties, the brewer might adopt the use of sugar, molasses, honey, or the sweet of any vegetable, to equal advantage; which cannot now be done, unless an eligible succedaneum be found to answer that purpose. As we are at present circumstanced, a search on the other side would turn more to the brewer's account. We have in malt a superabundance of the grosser principles; and would government permit the introduction of a foreign addition to the saccharine, which is too deficient, many valuable improvements might be made from it; as we could, by a judicious application of such adventitious principle, produce a second and third wort, of quality very little inferior to the first.

"But in these experiments a very particular attention would be necessary to the solvent powers of the water at different degrees of heat, and to the inquiry how far a menstruum saturated with one principle may be capable of dissolving another. Such a consideration is the more necessary on this occasion to direct us clear of two extremes equally disagreeable: the first is, that of applying the menstruum pure, and at such a heat as to bring off an over proportion of the oleaginous and earthy principles, which would occasion in the beer, thus wanting its natural share of saccharum, a harshness and austerity which scarce any time the brewer could allow would be able to dissipate; the other is, that of previously loading the menstruum with the adopted sweet in such an abundance as to destroy its solvent force upon the characteristical qualities we wish to unite with it, and thereby leave it a mere solution of sugar. The requisite mean is that of considering what portion of the saccharine quality has been extracted in the first wort, according to the quantity of water and degree of heat applied; and then to make such a previous addition of artificial sweet as will just serve to counterbalance the deficiency, and assimilate with that

portion of the remaining principles we are taught to expect will be extracted with the succeeding wort.

"From the nature of the constituent principles of malt, it is easy to conceive, that the former, or saccharine or mucilaginous parts, yield most readily to the impression of water, and that at so low a degree of heat as would have no visible effect upon the latter. If, therefore, we are to have a certain proportion of every part, it is a rational inference, that the means of obtaining it rests in a judicious variation of the extracting heat according to the several proportions required.

"A low degree of heat, acting principally upon the saccharum, produces a wort replete with a rich soft sweet, fully impregnated with its attendant mucilage, and in quantity much exceeding that obtainable from increased heat; which by its more powerful insinuation into the body of the malt acting upon all the parts together, extracts a considerable portion of the oleaginous and earthy principles, but falls short in softness, fulness, sweetness, and quantity. This is occasioned by the coagulating property of the mucilage, which, partaking of the nature of flour, has a tendency to run into paste in proportion to the increase of heat applied; by which means it not only locks up a considerable part of the saccharum contained therein, but retains with it a proportionate quantity of the extracting liquor, which would otherwise have drawn out the imprisoned sweet, thence lessening both the quantity and quality of the worts. And this has sometimes been known to have had so powerful an effect, as to have occasioned the *setting of the goods*, or the uniting the whole into a pasty mass; for though heat increases the solvent powers of water in most instances, there are some in which it totally destroys them. Such is the presence of flour, which it converts into paste; besides those of blood, eggs, and some other animal substances, which it invariably tends to harden.

"From a knowledge of these effects, we form our ideas of the variations necessary in the heat of the extracting liquor; which are of more extensive utility than has yet been intimated, though exceedingly limited in their extent from one extreme to the other.

"The most common effects of too low a heat, besides sometimes producing immediate acidity, are an insipidity of the flavour of the beer, and a want of early transparency, from the superabundance of mucilaginous matter extracted by such heats, which, after the utmost efforts of fermentation, will leave the beer turbid with such a cloud of its lighter feculencies as will require the separation and precipitation of many months to disperse.

"The contrary application, of too much heat, at the same time that it lessens the mucilage, has, as we have seen before, the effect of diminishing the saccharum also; whence that lean thin quality observable in some beers; and, by extracting an over proportion of oleaginous and earthy particles, renders the business of fermentation difficult and precarious, and impresses an austerity on the flavour of the liquor which will not easily be effaced.

"Yet the true medium heat for each extract cannot be universally ascertained. An attention not only to the quality of the malt, but to the quantity wetted, is absolutely necessary to the obtaining every due advantage;

Brewing.

Brewing

10
Of fermenta-
tion.

tage; nor must the period at which the beer is intended for use be omitted in the account. The quality of the water also claims a share in the consideration, in order to supply that deficient thinness and want of solvent force in hard, and to allow for the natural fulness and fermentative quality of soft; a particular to which London in a great measure owes the peculiar mucilaginous and nutritious quality of its malt liquors.

“Although the variations above alluded to are indispensable, it is easy to conceive from the small extent of the utmost variety, that they cannot be far distant. If, therefore, we know that a certain degree extracts the first principles in a certain proportion, we need not much consideration to fix upon another degree that shall produce the required proportion of the remaining qualities, and effect that equal distribution of parts in the extract which it is the business of fermentation to form into a consistent whole.”

9
Of boiling
worts.

The principal use of boiling, as it respects the worts particularly, is to separate the grosser or more palpable parts of the extract, preparatory to that more minute separation which is to be effected in the gyle tun. The eye is a very competent judge of this effect; for the concretions into which the continued action of boiling forms those parts are obvious to the slightest inspection, whilst the perfect transparency of the interstices of the worts points out its utility in promoting that desirable quality in the beer. These coagulable parts are formed from the superabundant mucilage already mentioned; and hence they are found in greater proportion in the first worts than in those that come after; at the same time, they are in these last so mingled with a quantity of oleaginous matter, that they become much more difficultly coagulable in the weak worts than in such as are stronger, and hence these require to be much longer boiled than the others.

During this operation the hops are generally added, which are found to be absolutely necessary for preventing the too great tendency of beer to acidity. The fine essential oil of hops being most volatile and soonest extracted, we are thence taught the advantage of boiling the first wort no longer than is sufficient to form the extract, without exposing it to the action of the fire so long as to dissipate the finer parts of this most valuable principle, and defeat the purpose of obtaining it. To the subsequent worts we can afford a larger allowance, and pursue the means of preservation so long as we can keep in view those of flavour; to which no rules can positively direct, the process varying with every variety of beer, and differing as essentially in the production of porter and pale ale as the modes of producing wine and vinegar.

The consequence of not allowing a sufficient time for the due separation of the parts of the wort and extraction of the requisite qualities of the hop must be obvious. If we proceed to the other extreme, we have every thing to apprehend from the introduction of too large a quantity of the grosser principles of the hop, which are very inimical to fermentation; and from impairing the fermentative quality of the worts themselves, by suffering their too long exposure to the action of the fire passing through them, whereby they are reduced to a more dense consistence, and their parts too intimately blended to yield to the separating force of fer-

mentation with that ease the perfection of the process requires.

The last step in the process of brewing is to ferment the liquor properly; for if this is not done, whatever care and pains have been taken in the other parts, they will be found altogether insufficient to produce the liquor desired. The first thing to be done here is to procure a proper ferment; for though all fermentable liquors would in time begin to ferment of themselves, yet, being also susceptible of putrefaction, the vinous and putrefactive ferments would both take place at the same time in such a manner that the product would be entirely spoiled. There are only two kinds of artificial ferments procurable in large quantity, and at a low price, *viz.* beer-yeast and wine- lees. A prudent management of these might render the business of the brewery for distillation, as in the business of the malt-distiller, &c. much more easy and advantageous *.

Brewers have always found it a considerable difficulty to procure these ferments in sufficient quantities, and preserve them constantly ready for use; and this has been so great a discouragement to the business, that some have endeavoured to produce other ferments, or to form mixtures or compounds of particular fermentable ingredients: but this has been attempted without any great success, all these mixtures falling short even of common baker's leaven in their use. Whoever has a turn for making experiments and attempting improvements of this kind, will find it much easier and more advantageous to preserve and raise nurseries of the common ones, than to devise mixtures of others. Yeast may be preserved by freeing it from its moister parts. This may be done by the sun's heat, but slowly and imperfectly. The best method is by gently pressing it in canvas bags: thus the liquid part, in which there is scarce any virtue, will be thrown off, and the solid will remain behind in form of a cake, which may be packed in a barrel or box, and will keep for a long time sweet and fragrant, and fit for the finest uses; and the same method may be taken either with wine-lees or the flowers of wine. The former may be brought from abroad with great ease in this manner: the latter may be made with us from the lees, by only dissolving them in water, and stirring them about with a stick; by this means, the lighter, more moveable, and more active part of the lees will be thrown up to the top, and may be taken off and preserved, in the manner above mentioned, in any quantity desired. By this means, an easy method is found of raising an inexhaustible fund; or a perpetual supply of the most proper ferments may be readily formed in the way of successive generation, so as to cut off all future occasion of complaint for want of them in the business of distillation. It must be observed, that all ferments abound in essential oil much more than the liquors which produce them; whence they very strongly retain the particular flavour and scent of the subject from whence they were made. It is requisite, therefore, before the ferment is applied, to consider what flavour ought to be introduced, and accordingly what species of ferment is most suited to the liquor. The alteration thus caused by ferments is to considerable, as to determine or bring over any naturally fermentable liquor of a neutral kind to be of the same kind with that which yielded the ferment. The benefit of this

* See *Dij. lation.*

Brewing,
Brey.

however, does not extend to malt, or to any other matter that does not naturally yield a tolerably pure and tasteless spirit, as it otherwise makes not a simple, pure, and uniform flavour, but a compound and mixed one.

The greatest circumspection and care are necessary in regard to the quality of the ferment. It must be chosen perfectly sweet and fresh: for all ferments are liable to grow musty and corrupt; and if in this case they are mixed with the fermentable liquor, they will communicate their nauseous and filthy flavour to it in such a manner as never to be got off. If the ferment is sour, it must by no means be used for any liquor; for it will communicate its flavour to the whole, and even prevents its rising to a head, and give it an acetous, instead of a vinous, tendency. When the proper quantity is got ready, it must be put to the liquor in a state barely tepid, or scarce luke-warm. The best method of putting them together, so as to make the fermentation strong and quick, is as follows. When the ferment is solid, it must be broken to pieces, and gently thinned with some of the warm liquor; but a complete or uniform solution of it is not to be expected or desired, as this would weaken its efficacy for the future business. The whole intended quantity being thus loosely mixed in some of the luke-warm liquor, and kept near the fire or elsewhere in a tepid state, free from too rude commerce with the external air, more of the insensibly warm liquor ought at proper intervals to be brought in, till thus by degrees the whole quantity is set at work together. When the whole is thus set at work, secured in a proper degree of warmth, and kept from a too free intercourse with the external air, it becomes as it were the business of nature to finish the operation.

In the operation of fermentation, however, the degree of heat employed is of the utmost consequence. In forming the extracts of the malt, the variation of a few degrees of heat produces an important difference in the effect. In the heat of fermentation, similar consequences result from similar variety. Under a certain regulation of the process, we can retain in the beer, as far as art is capable, the finer mucilage, and thereby preserve that fulness upon the palate which is by many so much admired: on the other hand, by a slight alteration we can throw it off, and produce that evenness and uniformity of flavour which has scarce any characteristic property, and is preferred by some only for want of that heaviness which they complain of in full beers. If a more vinous racy ale be required, we can, by collecting and confining the operation within the body of the wort, cause the separation and absorption of such an abundant portion of the oleaginous and earthy principles, as to produce a liquor in a perfect state at the earliest period, and so highly flavoured as to create a suspicion of an adventitious quality. But though all this may be done, and often hath been done, the proper management of fermenting liquors depends so much upon a multiplicity of slight and seemingly unimportant circumstances, that it hath never yet been laid down in an intelligible manner; and no rules, drawn from any thing hitherto published on the subject of brewing, can be at all sufficient to direct any person in this matter, unless he hath had considerable opportunities of observing the practice of a brew-house.

BREY, a town of Germany, on the frontiers of

Brabant, seated on a rivulet, in E. Lon. 5. 35. N. Lat. 51. 6.

BREYNIA, in botany, a synonyme of the capparid. See **CAPPARIS**.

BRIANCON, a town of France, in upper Dauphiny, capital of the Brianconnois. E. Long. 6. 45. N. Lat. 44. 46.

BRIANCONNOIS, a territory of France, in Dauphiny bounded by Grenoblois, Gapennois, Ambrunois, Piedmont, and Savoy. It comprehends several valleys, which lie among the mountains of the Alps; and though it is extremely cold, yet it is fertile in corn and pastures. The inhabitants have a great deal of wood; yet they choose to be in the stables with their cattle six months in the year, to keep themselves warm. Briancon is the capital town.

BRIAR, in botany, the English name of a species of rose. See **ROSA**.

BRIARE, a town of France, in the Gatinois, seated on the river Loire. It is remarkable for nothing but a long street full of inns and farriers, it being on the great road to Lyons; and the canal of Briare, which is 33 miles in length, and maintains a communication between the Loire and the Seine, by means of the Loing. E. Long. 2. 45. N. Lat. 47. 40.

BRIAREUS, in fabulous history, a giant; the son of Æther, Titan, or Cœlus, and Terra. This was his name in heaven; on earth he was called *Ægeon*. He was of singular service to Jupiter, when Juno, Pallas, Neptune, and the rest of the gods, endeavoured to bind him in chains and dethrone him. Afterwards, however, he conspired with the rest of his gigantic brethren to dethrone Jupiter. Virgil, on this occasion, describes him as having 100 hands, 50 heads, and breathing out fire †. The fable says that Jupiter, to punish him, threw him under mount Ætna, which, as often as he moves, belches out fire. See **ÆTNA**. † Æn. 2. 365.

BRIBE, a reward given to pervert the judgment. See the next article.

The word is French, *bribe*, which originally denotes a bit, fragment, or relic of meat taken off the table; on which footing, bribe imports as much as *paup mendicatus*, and still keeps up the idea of the matter whereof bribes anciently consisted. Hence also the Spaniards use *bribar* and *briuar* for *begging*; and *briua briveneria*, and *briuvismo*, for *beggary*. In middle-age writers, a bribe given a judge is called *quato litis*, and the receiver, *campi particeps*, or *cambi particeps*; because the spoils of the field i. e. the profits of the cause, were thus shared with the giver.

BRIBERY, in law, is a high offence, where a person in a judicial place takes any fee, gift, reward, or brockage, for doing his office, but of the king only. But, taken largely, it signifies the receiving or offering any undue reward to or by any person concerned in the administration of public justice, whether judge, officer, &c. to act contrary to his duty; and sometimes it signifies the taking or giving a reward for a public office.

In the East it is the custom never to petition any superior for justice, not excepting their kings, without a present. This is calculated for the genius of despotic countries; where the true principles of government are never understood, and it is imagined that there is no

Bribery

Black.
Comment.

obligation due from the superior to the inferior, no relative duty owing from the governor to the governed. The Roman law, though it contained many severe injunctions against bribery, as well for selling a man's vote in the senate or other public assembly, as for the bettering of common justice; yet, by a strange indulgence in one instance, it tacitly encouraged this practice; allowing the magistrate to receive small presents, provided they did not on the whole exceed 100 crowns a-year: not considering the insinuating nature and gigantic progress of this vice, when once admitted. Plato, therefore, in his ideal republic, orders those who take presents for doing their duty to be punished in the severest manner: and by the laws of Athens, he that offered a bribe was also prosecuted, as well as he that received a bribe. In England this offence of taking bribes is punished, in inferior officers, with fine and imprisonment; and in those that offer a bribe, though not taken, the same. But in judges, especially the superior ones, it has been always looked upon as so heinous an offence, that the chief justice Thorpe was hanged for it in the reign of Edward III. By a statute of Henry IV. all judges and officers of the king convicted of bribery, shall forfeit treble the bribe, be punished at the king's will, and be discharged from his service for ever. And some notable examples have been made in parliament, of persons in the highest stations, and otherwise very eminent and able, but contaminated with this forbidden vice. Thus in the reign of king James I. the earl of M. lord treasurer of England, being impeached by the commons, for refusing to hear petitions referred to him by the king, till he had received bribes, &c. was, by sentence of the lords, deprived of all his offices, and disabled to hold any for the future, or to sit in parliament; he was also fined 50,000 l. and imprisoned during the king's pleasure. In the 11th year of king George I. the lord chancellor M—— had a somewhat milder punishment: he was impeached by the commons, with great zeal, for bribery, in selling the places of masters in chancery for exorbitant sums, and other corrupt practices, tending to the great loss and ruin of the suitors of that court; and the charge being made good against him, being before divested of his office, he was sentenced to pay a fine of 30,000 l. and imprisoned till it was paid. It is said that one of the peers, if not two, who voted against him, had been possessed of the office of chancellor, and sold the places of masters in chancery whenever vacant.

BRIBERY in Elections. See ELECTIONS.

BRICIANI, those of the order of that name. This was a military order, instituted by St Bridget, queen of Sweden, who gave them the rules and constitutions of those of Malta and St Augustin. This order was approved by pope Urban V. They were to fight for the burying of the dead, to relieve and assist widows, orphans, the lame, sick, &c.

BRICK, a fat reddish earth, formed into long squares, four inches broad, and eight or nine long, by means of a wooden mould, and then baked or burnt in a kiln, to serve the purposes of building.

Bricks are of great antiquity, as appears by the sacred writings, the tower and walls of Babylon being built with them.

The Greeks chiefly used three kinds of bricks; the first whereof was called [*didiron*], i. e. of two palms;

the second [*tetradiron*], of four palms; the third [*pentadiron*], of five palms. They had also other bricks, just half each of those, to render their works more solid, and also more agreeable to the sight, by the diversities of the figures and sizes of the bricks.

The dimensions of the brick chiefly used by the Romans, according to Pliny, were a foot and a half long, and a foot broad; which measures agree with those of several Roman bricks in England, which are about 17 inches long, and 11 broad, of our measure. Sir Henry Wotton speaks of a sort of bricks at Venice, of which stately columns were built; they were first formed in a circular mould, and cut, before they were burnt, into four or more quarters or sides; afterwards, in laying, they were jointed so close, and the points concentrated so exactly, that the pillars appeared one entire piece. The ordinary Paris brick is eight inches long, four broad, and two thick, French measure, which makes something more than ours. But this smallness is an advantage to a building, the strength of which consists much in the multitude of angles and joints, at least if well laid, and having a good bond.

Bricks among us are various, according to their various forms, dimensions, uses, method of making, &c. The principal are, compass-bricks, of a circular form, used in steining of walls: concave, or hollow bricks, on one side flat like a common brick, on the other hollowed, and used for conveyance of water: feather-edged bricks, which are like common statute-bricks, only thinner on one edge than the other, and used for penning up the brick pannels in timber buildings: cogging bricks are used for making the indented works under the coping of walls built with great bricks: coping bricks, formed on purpose for coping of walls: Dutch or Flemish bricks, used to pave yards, stables, and for soap-boilers vaults and cisterns: clinkers, such bricks as are glazed by the heat of the fire in making: sandel or samel-bricks, are such as lie outmost in a kiln or clamp, and consequently are soft and useless, as not being thoroughly burnt: great bricks are those twelve inches long, six broad, and three thick, used to build fence-walls: platter or buttress bricks, have a notch at one end, half the breadth of the brick; their use is to bind the work which is built of great bricks: statute-bricks, or small common bricks, ought, when burnt, to be nine inches long, four and a quarter broad, and two and a half thick; they are commonly used in paving cellars, sinks, hearths, &c.

Worlidge, and others after him, have endeavoured to excite brickmakers to try their skill in making a new kind of brick, or a composition of clay and sand, whereof to form window-frames, chimney-pieces, door-cases, and the like. It is to be made in pieces fashioned in moulds, which, when burnt, may be set together with a fine red cement, and seem as one entire piece, by which may be imitated all manner of stone-work. The thing should seem feasible, by the earthen pipes made fine, thin, and durable, to carry water under-ground at Portsmouth; and by the earthen backs and grates for chimneys, formerly made by Sir John Winter, of a great bigness and thickness. If chimney-pieces thus made in moulds, and dried and burnt, were not found smooth enough, they might be polished with sand and water; or were care taken, when they were half dry in the air, to have them polished with an instrument of

Brick.
Wotton.
Elem. of Architecture
l. iii.

Supplement to Chambers.

Brick.

copper or iron, then leave them till they were dry enough to burn, it is evident they would not want much polishing afterwards. The work might even be glazed, as potters do their fine earthen ware, either white, or of any other colour; or it might be veined in imitation of marble, or be painted with figures of various colours, which would be much cheaper, perhaps equally durable, and as beautiful, as marble itself.

Bricks are commonly red; though there are some also of a white colour, for which fort Walpit in Suffolk is famous. Bricks may be made of any earth that is clear of stones, even sea-oufe; but all will not burn red, a property peculiar to earths which contain ferruginous particles. In England, bricks are chiefly made of a hazely, yellowish-coloured, fatty earth, somewhat reddish, vulgarly called *loam*. The earth, according to Leibourn, ought to be dug before winter, but not made into bricks before spring. For the making of such bricks as will stand the fiercest fires, Sturbridge clay or Windfor loam are esteemed the best. In general, the earth whereof bricks are made ought not to be too sandy, which would render them heavy and brittle; nor too fat, which would make them crack in drying.

The first step in the process of brickmaking is casting the clay, or earth. The next step is to tread or temper it, which ought to be performed doubly of what is usually done; since the goodness of the bricks depends chiefly upon this first preparation. The earth itself, before it is wrought, is generally brittle and dully; but adding small quantities of water gradually to it, and working and incorporating it together, it opens its body, and tinges the whole with a tough, gluey band or substance. If, in the tempering, you overwater them, as the usual method is, they become dry and brittle, almost as the earth they are made of; whereas, if duly tempered, they become smooth and solid, hard and durable. A brick of this last fort takes up near as much earth as a brick and a half made the contrary way; in which the bricks are spongy, light, and full of cracks, partly through want of due working, and partly by mixing of ashes and light sandy earth to make it work easy and with greater dispatch; as also to save culm or coals in the burning. We may add, that for bricks made of good earth, and well tempered, as they become solid and ponderous, so they take up a longer time in drying and burning than the common ones; and that the well drying of bricks before they are burnt, prevents their cracking and crumbling in the burning.

Bricks are burnt either in a kiln or clamp. Those that are burnt in a kiln, are first set or placed in it; and then the kiln being covered with pieces of bricks, they put in some wood to dry them with a gentle fire; and this they continue till the bricks are pretty dry, which is known by the smoke's turning from a darkish colour to transparent smoke: they then leave off putting in wood, and proceed to make ready for burning; which is performed by putting in brush, furze, spray, heath, brake, or fern faggots; but before they put in any faggots, they dam up the mouth or mouths of the kiln with pieces of bricks (which they call *binleg*) piled up one upon another, and close it up with wet brick-earth instead of mortar. The shinlog they make so high, that there is but just room above it to thrust in a faggot: then they proceed to put in more faggots, till the kiln

and its arches look white, and the fire appears at the top of the kiln; upon which they slacken the fire for an hour, and let all cool by degrees. This they continue to do, alternately heating and slackening, till the ware be thoroughly burnt, which is usually effected in 48 hours.

About London they chiefly burn in *clamps*, built of the bricks themselves, after the manner of arches in kilns, with a vacancy between each brick, for the fire to play through; but with this difference, that instead of arching, they span it over by making the bricks project one over another on both sides of the place, for the wood and coals to lie in till they meet, and are bounded by the bricks at the top, which close all up. The place for the fuel is carried up straight on both sides, till about three feet high; then they almost fill it with wood, and over that lay a covering of sea-coal, and then overspan the arch; but they strew sea-coal also over the clamp, betwixt all the rows of bricks; lastly, they kindle the wood, which gives fire to the coal; and when all is consumed, then they conclude the bricks are sufficiently burnt.

In Dr Percival's essays*, we have the following experiment of the effects of bricks on water. "Two or three pieces of common brick were steeped four days in a basin full of distilled water. The water was then decanted off, and examined by various chemical tests. It was immiscible with soap, struck a lively green with syrup of violets, was rendered slightly lactescent by the volatile alkali, and quite milky by the fixed alkali and by a solution of saccharum saturni. The infusion of tormentil root produced no change in it." This experiment, he observes, affords a striking proof of the impropriety of lining wells with brick, a practice very common in many places, and which cannot fail of rendering the water hard and unwholesome. Clay generally contains a variety of heterogeneous matters. The coloured loams often participate of bitumen, and the ochre of iron. Sand and calcareous earth are still more common ingredients in their composition; and the experiments of Mr Geoffry and Mr Pott prove, that the earth of alum also may in large quantity be extracted from clay. Now as clay is exposed to the open air for a long space of time, is then moulded into bricks, and burnt, this process resembles in many respects that by which the alum-stone is prepared. And it is probable that the white efflorescence which is frequently observable on the surface of new bricks, is of an aluminous nature. The long exposure of clay to the air before it is moulded into bricks, the sulphureous exhalations of the pit-coal used for burning it, together with the suffocating and bituminous vapour which arises from the ignited clay itself, sufficiently account for the combination of a vitriolic acid with the earth of alum.

Oil of BRICKS, olive oil imbibed by the substance of bricks, and afterwards distilled from it. This oil was once in great repute for curing many diseases, but is now justly laid aside.

BRICK-Layer, an artificer, whose business is to build with bricks, or make brick work.

Bricklayers work, or business, in London, includes tiling, walling, chimney-work, and paving with bricks and tiles. In the country it also includes the mason's and plasterer's business.

The materials used by brick-layers are bricks, tiles, mortar,

Bricks

* Vol. I. P. 392.

Brick mortar, laths, nails, and tye-pins. Their tools are a brick trowel, wherewith to take up mortar; a brick-ax, to cut bricks to the determined shape; a saw, for sawing bricks; a rub-stone, on which to rub them; also a square, wherewith to lay the bed or bottom, and face or surface of the brick, to see whether they are at right angles; a bevel, by which to cut the under sides of bricks to the angles required; a small trammel of iron, wherewith to mark the bricks; a float-stone, with which to rub a moulding of brick to the pattern described; a banker, to cut the bricks on; line-pins, to lay their rows or courses by; plumb-rule, whereby to carry their work upright; level, to conduct it horizontal; square, to set off right angles; ten-foot-rod, wherewith to take dimensions; jointer, wherewith to run the long joints; rammer, wherewith to beat the foundation; crow and pick-ax, wherewith to dig through walls.

The London brick-layers make a regular company, which was incorporated in 1568; and consists of a master, two wardens, 20 assistants, and 78 on the livery.

Brick-Laying, the art of framing edifices of bricks.

Moxon hath an express treatise on the art of brick-laying; in which he describes the materials, tools, and method of working, used by brick layers.

Great care is to be taken, that bricks be laid joint on joint in the middle of the walls as seldom as may be; and that there be good bond made there, as well as on the out-sides. Some brick-layers, in working a brick and half wall, lay the header on one side of the wall perpendicular on the header on the other side, and so all along the whole course; whereas, if the header on one side of the wall were toothed as much as the stretcher on the other side, it would be a stronger tooth-ing, and the joints of the headers of one side would be in the middle of the headers of the course they lie upon of the other side. If bricks be laid in winter, let them be kept as dry as possible; if in summer, it will quit cost to employ boys to wet them, for that they will then unite with the mortar better than if dry, and will make the work stronger. In large buildings, or where it is thought too much trouble to dip all the bricks separately, water may be thrown on each course after they are laid, as was done at the building the physician's college, by order of Dr Hooke. If bricks are laid in summer, they are to be covered; for if the mortar dries too hastily, it will not bind so firmly to the bricks as when left to dry more gradually. If the bricks be laid in winter, they should also be covered well, to protect them from rain, snow and frost; which last is a mortal enemy to mortar, especially to all such as have been wetted just before the frost assails it.

Brick-Maker, is he who undertakes the making of BRICKS. This is mostly performed at some small distance from cities and towns; and though some, thro' ignorance, look upon it as a very mean employ, because laborious, yet the masters about London, and other capital cities, are generally men of substance.

BRICKING, among builders, the counterfeiting of a brick wall on plaster: which is done by smearing it over with red ochre, and making the joints with an edged tool; these last are afterwards filled with a fine plaster.

BRIDE, a woman newly married. Among the Greeks, it was customary for the bride to be conducted from her father's house to her husband's in a chariot,

the evening being chosen for that purpose, to conceal her blushes; she was placed in the middle, her husband sitting on one side, and one of her most intimate friends on the other; torches were carried before her, and she was entertained in the passage with a song suitable to the occasion. When they arrived at their journey's end, the axle-tree of the coach they rode in was burnt, to signify that the bride was never to return to her father's house.—Among the Romans, the bride was to seem to be ravished by force from her mother, in memory of the rape of the Sabines under Romulus: she was to be carried home in the night-time to the bridegroom's house, accompanied by three boys, one whereof carried a torch, and the other two led the bride; a spindle and distaff being carried with her: she brought three pieces of money called asses, in her hand to the bridegroom, whose doors on this occasion were adorned with flowers and branches of trees: being here interrogated who she was, she was to answer *Caia*, in memory of *Caia Cecilia*, wife of Tarquin the Elder, who was an excellent *lanitica* or spinster; for the like reason, before her entrance, she lined the door-polls with wool, and smeared them with grease. Fire and water being set on the threshold, she touched both; but starting back from the door, refused to enter, till at length she passed the threshold, being careful to step over without touching it: here the keys were given her, a nuptial supper was prepared for her, and minstrels to divert her; she was seated on the figure of a priapus, and here the attendant boys resigned her to the *pronuba*, who brought her into the nuptial chamber and put her to bed. This office was to be performed by matrons who had only been once married, to denote that the marriage was to be for perpetuity.

BRIDEGROOM, a man newly married, the spouse of the bride.

The Spartan bridegrooms committed a kind of rape upon their brides. For matters being agreed on between them two, the woman that contrived and managed the match, having shaved the bride's hair close to her skin, dressed her up in man's clothes, and left her upon a mattress: this done, in came the bridegroom, in his usual dress, having supped as ordinary, and stealing as privately as he could to the room where the bride lay, and untying her virgin girdle, took her to his embraces; and having stayed a short time with her, returned to his companions, with whom he continued to spend his life, remaining with them by night as well as by day, unless he stole a short visit to his bride, which could not be done without a great deal of circumspection, and fear of being discovered. Among the Romans, the bridegroom was decked to receive his bride; his hair was combed and cut in a particular fashion; he had a coronet or chaplet on his head, and was dressed in a white garment.

By the ancient canons, the bridegroom was to forbear the enjoyment of his bride the first night, in honour of the nuptial benediction given by the priest on that day*. In Scotland, and perhaps also some parts of England, a custom called *marchet*, obtains; by which the lord of the manor was intitled to the first night's habitation with his tenants' brides†.

BRIDEWELL, a work-house, or place of correction for vagrants, strumpets, and other disordered persons.—These are made to work, being maintained with

Bride-
groom,
Bride's l

Bridewell, Bridge. clothing and diet; and when it seems good to their governors, they are sent by passes into their native countries; however, while they remain here, they are not only made to work, but, according to their crimes, receive once a fortnight such a number of stripes as the governor commands.

BRIDEWELL, near Fleet-street, is a foundation of a mixt and singular nature, partaking of the hospital, the prison, and workhouse; it was founded in 1553, by Edward VI. who gave the place where king John had formerly kept his court, and which had been repaired by Henry VIII. to the city of London, with 700 merks of land, bedding, and other furniture. Several youths are sent to this hospital as apprentices to manufacturers, who reside there; they are clothed in blue doublets and breeches, with white hats. Having faithfully served their time of seven years, they have their freedom, and a donation of L. 10 each, for carrying on their respective trades.

BRIDGE, a work of masonry or timber, consisting of one or more arches built over a river, canal, or the like, for the conveniency of passing the same. See **ARCHITECTURE**, n^o 122; and **CANAL**.

The first inventor of bridges, as well as of ships and crowns, is by some learned men supposed to be Janus: their reason is, that on several ancient Greek, Sicilian, and Italian coins, there are represented on one side a Janus, with two faces; and on the other a bridge, or a crown or a ship.

Bridges are a sort of edifices very difficult to execute on account of the inconvenience of laying foundations and walling under water. The earliest rules and instructions relating to the building of bridges are given by Leon Baptista Alberti, *Archit.* l. viii. Others were afterwards laid down by Palladio, l. iii. Serlio, l. iii. c. 4. and Scamozzi, l. v. all of which are collected by M. Blondel, *Cours d'Archit.* p. 629, *seq.* The best of them are also given by Goldman, *Baukbursi*, l. iv. c. 4. p. 134, and Hawkesmoor's History of London bridge, p. 26, *seq.* M. Gautier has a piece expressive on bridges, ancient and modern; *Trait des Ponts*, Paris 1716, 12mo.

The parts of a bridge are, The piers; the arches; the pavement, or way over for cattle and carriages; the foot-way on each side, for foot-passengers; the rail or parapet, which incloses the whole; and the buttments or ends of the bridge on the bank.

The conditions required in a bridge are, That it be well-designed, commodious, durable, and suitably decorated. The piers of stone-bridges should be equal in number, that there may be one arch in the middle, where commonly the current is strongest: their thickness is not to be less than a sixth part of the span of the arch, nor more than a fourth; they are commonly guarded in the front with angular sterlings, to break the force of the current: the strongest arches are those whose sweep is a whole semicircle; as the piers of bridges always diminish the bed of a river, in case of inundations, the bed must be sunk or hollowed in proportion to the space taken up by the piers, as the waters gain in depth what they lose in breadth, which otherwise conduce to wash away the foundation and endanger the piers: to prevent this, they sometimes diminish the current, either by lengthening its course, or by making it more winding; or by stopping the bottom with

rows of planks, stakes, or piles, which break the current.

Among the Romans, the building and repairing of bridges was first committed to the pontifices or priests; then to the censors, or curators of the roads; lastly, the emperors took the care of bridges into their own hands. Thus Antoninus Pius built the Pons Janiculensis of marble; Gordian restored the Pons Cestius; and Adrian built a new one denominated from him. In the middle-age, bridge-building was reckoned among the acts of religion; and a regular order of Hospitaliers was founded by St Benezet, towards the end of the 12th century, under the denomination of *pontifices*, or bridge-builders, whose office it was to be assitant to travellers, by making bridges, settling ferries, and receiving strangers in hospitals, or houses built on the banks of rivers. We read of one hospital of this kind at Avignon, where the hospitaliers dwelt under the direction of their first superior St Benezet. The Jesuit Raynaldus has a treatise expressive on St John the bridge-builder.

Among the bridges of antiquity, that built by Trajan over the Danube is allowed to be the most magnificent.

Among modern bridges, that of Westminster, built over the river Thames, may be accounted one of the finest in the world: it is 44 feet wide, a commodious foot-way being allowed for passengers, on each side, of about seven feet broad, raised above the road allowed for carriages, and paved with broad moor-stones, while the space left between them is sufficient to admit three carriages and two horses to go a-breast, without any danger. Its extent from wharf to wharf is 1220 or 1223 feet, being full 300 feet longer than London-bridge. The free water-way under the arches of this bridge is 875 feet, being four times as much as the free water-way left between the sterlings of London bridge: this disposition, together with the gentleness of the stream, are the chief reasons why no sensible fall of water can ever stop, or in the least endanger, the smallest boats in their passage through the arches.

It consists of 13 large and 2 small arches, together with 14 intermediate piers.

Each pier terminates with a salient right angle against either stream: the two middle piers are each 17 feet in thickness at the springing of the arches, and contain 3000 cubic feet, or near 200 tons, of solid stone; and the others decrease in width equally on each side by one foot.

All the arches of this bridge are semicircular; they all spring from about two feet above low-water mark; the middle arch is 76 feet wide, and the others decrease in breadth equally on each side by 4 feet.

This bridge is built of the best materials; and the size and disposition of these materials are such, that there is no false bearing, or so much as a false joint in the whole structure; besides that it is built in a neat and elegant taste, and with such simplicity and grandeur, that, whether viewed from the water, or by the passengers who walk over it, it fills the mind with an agreeable surprize. The semioctangular towers which form the recesses of the foot-way, the manner of placing the lamps, and the height of the balustrade, are at once the most beautiful, and, in every other respect, the best contrived.

Bridge.

Bridge.

London-bridge consists of 20 locks or arches, 19 of which are open, and one filled up or obscured. It is 900 feet long, 60 high, and 74 broad, with almost 20 feet aperture in each arch. It is supported by 18 piers, from 25 to 34 feet thick; so that the greatest water-way when the tide is above the sterlings is 450 feet, scarce half the width of the river; and below the sterlings, the water-way is reduced to 194 feet. Thus a river 900 feet wide is here forced through a channel of 194 feet. London bridge was first built of timber, some time before the year 994, by a college of priests, to whom the profits of the ferry of St Mary Overy's had descended; it was repaired, or rather new built of timber, in 1163. The stone-bridge was begun by king Henry in 1176, and finished by king John in 1209. The architect was Peter of Colechurch, a priest. For the keeping it in repair, a large house is allotted, with a great number of offices, and a vast revenue in land, &c. The chief officers are two bridge-masters, chosen yearly out of the body of the livery. The defects of this bridge are the narrowness and irregularity of the arches, and the largeness of the piers, which, together with the sterlings, turn the current of the Thames into many frightful cataracts, which must obstruct and endanger the navigation through the bridge. The sterlings have been added, to hinder the piers from being undermined by the rotting of the piles on which they are built: for by means of these sterlings the piles are kept constantly wet; and thus the timber is kept from decaying, which always happens when it is suffered to be alternately wet and dry.

Blackfriars bridge, situated near the centre of the city, and built according to a plan drawn by Mr Robert Mylne, is an exceeding light and elegant structure. The arches are only 9 in number; but very large, and of an elliptical form. The centre-arch is 100 feet wide; those on the sides decrease in a regular gradation; and the width of that near the abutment at each end is 70 feet. It has an open balustrade at the top, and a foot-way on each side, with room for three carriages abreast in the middle. It has also recesses on the sides for the foot-passengers, each supported by two lofty Ionic columns.

The longest bridge in England is that over the Trent at Burton, built by Bernard abbot of Burton, in the 12th century; it is all of squared free stone, strong and lofty, 1545 feet in length, and consisting of 34 arches. Yet this comes far short of the wooden bridge over the Drave, which according to Dr Brown is at least five miles long.

But the most singular bridge in Europe is that built over the river Tave in Glamorganshire. It consists of one stupendous arch, the diameter of which is 175 feet, the chord 140, the altitude 35, and the abutments 32. This magnificent arch was built by William Edward, a poor country mason, in the year 1756.

The famous bridge of Venice, called the *Rialto*, consists of but a single arch, and that a flat or low one, and passed for a masterpiece of art. It was built in 1591, on the design of Michael Angelo; the span of the arch is 88½ feet, and its height above the water only 23.—Poult mentions a bridge of a single arch in the city of Mostar in Bosnia, much bolder than that of the Ri-

alto at Venice. But these are nothing to a bridge in China, built from one mountain to another, consisting of a single arch 400 cubits long and 500 in height, whence it is called the *flying-bridge*: a figure of it is given in the Philosophical Transactions. Kircher also speaks of a bridge in the same country 360 perches long, supported by 300 pillars.

Rushen Bridges, *Pont de juncs*, is made of large sheaves of rushes growing in marshy grounds, which they cover with boards or planks; they serve for crossing ground that is boggy, miry, or rotten. The Romans had also a sort of subitaneous bridges made by the foldiers, of boats, or sometimes of casks, leather bottles, or bags, or even of bullocks bladders blown up and fastened together, called *ascogafri*. M. Couplet gives the figure of a portable bridge 200 feet long, easily taken asunder and put together again, and which 40 men may carry. Frezier speaks of a wonderful kind of bridge at Apurima in Lima, made of ropes, formed of the bark of a tree.

Pendent or Hanging Bridges, called also *Philosophical Bridges*, are those not supported either by posts or pillars, but hung at large in the air, only supported at the two ends or butments. Instances of such bridges are given by Palladio and others. Dr Wallis gives the design of a timber-bridge 70 feet long, without any pillars, which may be useful in some places where pillars cannot be conveniently erected. Dr Plot assures us, that there was formerly a large bridge over the castle-ditch at Tutbury in Staffordshire, made of pieces of timber, none much above a yard long, and yet not supported underneath either with pillars or archwork, or any sort of prop whatever.

Draw-Bridge, one that is fastened with hinges at one end only, so that the other may be drawn up; in which case, the bridge stands upright, to hinder the passage of a ditch or moat.

Flying-Bridge, or *Pons ductorius*, an appellation given to a bridge made of pontoons, leather boats, hollow beams, casks, or the like, laid on a river, and covered with planks, for the passage of an army.

Flying-Bridge (*pont volant*) more particularly denotes a bridge composed of one or two boats joined together by a sort of flooring, and surrounded with a rail or balustrade; having also one or more masts, to which is fastened a cable, supported, at proper distances, by boats, and extended to an anchor, to which the other end is fastened, in the middle of the water: by which contrivance, the bridge becomes moveable, like a pendulum from one side of the river to the other, without any other help than the rudder.—Such bridges sometimes also consist of two stories, for the quicker passage of a great number of men, or that both infantry and cavalry may pass at the same time.

In Plate CVIII is represented a flying-bridge of this kind. Fig. 2. is a perspective view of the course of a river and its two banks. *a, b, c, d*, Two long boats or batteaux, which support the flying bridge. *GH, KL*, two masts joined at their tops by two transverse pieces, or beams, and a central arch, and supported in a vertical position by two pair of throuds and two chains *LN, HR*. *M*, a hoist, or cross piece, over which the rope or cable *M, P, q, r*, that rises or holds the bridge against the current, passes. *E*, a roll or windlass round

Bridge

which the rope M, F, *e, f*, is wound. *a, b*, The rudders. A B, and CD, two portions of bridges of boats fastened to the bank on each side, and between which the flying bridge moves in passing from one side of the river to the other. *e, f*, Chains supported by two punts, or small flat-bottomed boats: there are five or six of these punts at about 40 fathoms from one another. The first, or farthest from the bridge, is moored with anchors in the middle of the bed of the river.

Fig. 3. Is a plan of the same bridge. *a, b, c, d*, The two boats that support it. K and G, the two masts. K F G, the transverse piece or beam over which the cable passes. E, the roll, or windlafs. round which the rope or cable is wound. *a, b*, The rudders. O, a boat. *e*, One of the punts, or small flat-bottomed boats that support the chain. N, N, pumps for extracting the water out of the boats. P, P, capstans.

Fig. 4. Lateral elevation of the bridge. *a, c*, One of the boats. *b*, The rudder. E, The roll, or windlafs. M, The horse, or cross-piece. G H, One of the masts. E, M, H, F, The cable. In this view the balustrade running along the side of the bridge is plainly exhibited.

Fig. 5. Elevation of the hinder or stern part of the bridge. *a, b*, The two boats. G H, K L, The two masts. H L, The upper transverse beam. *p, q*, The lower transverse beam, or that over which the cable passes, and on which it slides from one mast to the other; this beam is therefore always kept well greased. *p, k, q, g*, Shrouds extending from the sides of the bridge to the tops of the masts. M, The horse or cross-piece over which the cable passes to the roll or windlafs E.

BRIDGES of Boats are either made of copper or wooden boats, fastened with stakes or anchors, and laid over with planks. One of the most notable exploits of Julius Cæsar was the expeditious making a bridge of boats over the Rhine. Modern armies carry copper or tin boats, called *pontoons*, to be in readiness for making bridges; several of these being joined side by side till they reach across the river, and planks laid over them, make a plane for the men to march on. There are fine bridges of boats at Beaucaire and Rouen, which rise and fall with the water; and that at Seville is said to exceed them both. The bridge of boats at Rouen, built in lieu of the stately stone-bridge erected there by the Romans, is represented by a modern writer as the wonder of the present age. It always floats, and rises and falls with the tide, or as the land-waters fill the river. It is near 300 yards long, and is paved with stone, just as the streets are; carriages with the greatest burdens go over it with ease, and men and horses with safety, though there are no rails on either hand. The boats are very firm, and well moored with strong chains, and the whole well looked after and constantly repaired, though now very old.

BRIDGE of Communication, is that made over a river, by which two armies, or forts, which are separated by that river, have a free communication with one another.

Floating-BRIDGE, is ordinarily made of two small bridges, laid one over the other, in such manner as that the uppermost stretches and runs out, by the help of certain cords running through pulleys placed along the sides of the under-bridge, which push it forwards till the end of it joins the place it is designed to be

Brigde.

fixed on. When these two bridges are stretched out to their full length, so that the two middle ends meet, they are not to be above four or five fathoms long; because, if longer, they will break. Their chief use is for surprising out-works, or posts that have but narrow moats. In the memoirs of the royal academy of sciences we find an ingenious contrivance of a floating-bridge, which lays itself on the other side of the river.

BRIDGE, Natural, implies a bridge not constructed by art, but the result of some operation of nature.

A most wonderful work of this kind is described by Mr Jefferson in his *State of Virginia*. It is on the ascent of a hill, which seems to have been cleft through its length by some great convulsion. The fissure, just at the bridge, is, by some admeasurements, 270 feet deep, by others only 205. It is about 45 feet wide at the bottom, and 90 feet at the top; this of course determines the length of the bridge, and its height from the water. Its breadth in the middle is about 60 feet, but more at the ends, and the thickness of the mafs at the summit of the arch about 40 feet. A part of this thickness is constituted by a coat of earth, which gives growth to many large trees. The residue, with the hill on both sides, is one solid rock of limestone. The arch approaches the semi-elliptical form; but the larger axis of the ellipsis, which would be the cord of the arch, is many times longer than the transverse. Though the sides of this bridge are provided in some parts with a parapet of fixed rocks, yet few men have resolution to walk to them and look over into the abyss. You involuntarily fall on your hands and feet, creep to the parapet, and peep over it. Looking down from this height about a minute, gave our author a violent headache. If the view from the top be painful and intolerable, that from below is delightful in an equal extreme. It is impossible for the emotions arising from the sublime to be felt beyond what they are here: so beautiful an arch, so elevated, so light, and springing as it were up to heaven, the rapture of the spectator is really indescribable! The fissure continuing narrow, deep, and straight for a considerable distance above and below the bridge, opens a short but very pleasing view of the North-mountain on one side and Blue-ridge on the other, at the distance each of them of about five miles. This bridge is in the county of Rockbridge, to which it has given name, and affords a public and commodious passage over a valley, which cannot be crossed elsewhere for a considerable distance. The stream passing under it is called *Cedar-creek*. It is a water of James River, and sufficient in the driest seasons to turn a grist-mill, though its fountain is not more than two miles above.

Don Ulloa mentions a break, similar to this, in the province of Angaraez, in South America. It is from 16 to 22 feet wide, 111 feet deep, and of 1.3 miles continuance, English measures. Its breadth at top is not sensibly greater than at bottom. Don Ulloa inclines to the opinion, that this channel has been effected by the wearing of the water which runs through it, rather than that the mountain should have been broken open by any convulsion of nature. But if it had been worn by the running of water, would not the rocks which form the sides have been worn plane? or if, meeting in some parts with veins of harder stone, the

the water had left prominences on the one side, would not the same cause have sometimes, or perhaps generally, occasioned prominences on the other side also? Yet Don Ulloa tells us, that on the other side there are always corresponding cavities, and that these tally with the prominences so perfectly, that, were the two sides to come together, they would fit in all their indentures, without leaving any void. In fact, this does not resemble the effect of running water, but looks rather as if the two sides had parted asunder. The sides of the break, over which is the Natural bridge of Virginia, consisting of a veiny rock which yields to time, the correspondence between the salient and re-entering inequalities, if it existed at all, has now disappeared. This break has the advantage of the one described by Don Ulloa in its finest circumstance; no portion in that instance having held together, during the separation of the other parts, so as to form a bridge over the abyss.

BRIDGE, in gunnery, the two pieces of timber which go between the two transoms of a gun-carriage, on which the bed rests.

BRIDGE, in music, a term for that part of a stringed instrument over which the strings are stretched. The bridge of a violin is about one inch and a quarter high, and near an inch and a half long.

BRIDGE TOWN, the capital of the island of Barbadoes, situated in W. Long. 61°. N. Lat. 13°. It stands in the inmost part of Carlisle bay. This originally was a most unwholesome situation, and was chosen entirely for its convenience for trade; but is now deemed to be as healthy as any place in the island. The town itself would make a figure in any European kingdom. It is said to contain 1500 houses, and some contend that it is the finest the British possess in America. The houses in general are well built and finished, and their rents as high as such houses would let for in London. The wharfs and quays are well defended from the sea, and very convenient. The harbour is secure from the north-east wind, which is the constant trade wind there; and Carlisle-bay is capable of containing 500 ships, and is formed by Needham and Pelican points. But what renders Bridge-town the finest and most desirable town in the West Indies is its security against any attacks from foreign enemies. It is defended on the westward by James-fort, which mounts 18 guns. Near this is Willoughby's fort, which is built upon a tongue of land running into the sea, and mounts 12 guns. Needham's fort has three batteries, and is mounted with 20 guns; and St Anne's fort, which is the strongest in the island, stands more within land. In short, according to Mr Douglas, there is all along the lee-shore a breast-work and trench, in which, at proper places, were 29 forts and batteries, having 308 cannon mounted, while the windward shore is secured by high rocks, steep cliffs, and foul ground. Such was the state of the fortifications in 1717; but since that time they have been much strengthened. Bridge-town is destitute of few elegancies or conveniences of life that any city of Europe can afford. The church of St Michael exceeds many English cathedrals in beauty, largeness, and conveniency; and has a fine organ, bells, and clock. Here also is a free-school for the instruction of poor boys, an hospital, and a college. The latter was erected by the society for propagating the Christian religion, in pursuance of

the will of Colonel Christopher Codrington, who left about L. 2000 a-year for its endowment, for maintaining professors and scholars to study and practise divinity, surgery, and physic. See CODRINGTON.

BRIDGENORTH, a town of Shropshire in England, seated on the river Severn, which divides it into two parts; but they are united by a handsome stone bridge, and these are called the *upper* and the *lower town*. It is said to have been built by Ethelfleda, widow of Eiheldred king of the Mercians, about the year 675. Robert de Belzma, son of Robert de Montgomery, built the castle, and maintained it against king Henry I. by which means it was so seized to the crown, and remained so till the reign of Richard III. who gave it to John Sutton lord Dudley. This town has undergone several sieges; and in the civil war it suffered very much, many fine buildings, and the whole town, being almost destroyed by fire, when Sir Lewis Kirke defended the citadel for king Charles. There are now no other remains of the castle than a small part of the towers, and a place yet called the *castle*, within the walls of the old one; within which stands one of the churches, dedicated to St Mary Magdalen, which was made a free chapel, and exempted from episcopal jurisdiction. The other church is at the north end of the town, on the highest part of the hill, near to whose church-yard stood a college, which was destroyed by fire in the civil wars, together with the church just mentioned; which has been since rebuilt by the inhabitants. On the west bank of the river are the remains of an ancient and magnificent convent, under which was several remarkable vaults and caverns running to a great length. Part of the cow-gate street is a rock, rising perpendicularly, in which are several houses and tenements that make a very agreeable though grotesque appearance. In many other places there are also caves and dwellings for families, in the rocks; and indeed the whole town has an appearance surprisingly singular. W. Long. 2. 30. N. Lat. 52. 40.

BRIDGEWATER, a town of Somersetshire in England, seated on the river Parret, over which there is a stone bridge, near which ships of 100 tons burden may ride with ease. It is a large, well frequented place, with the title of a duchy, and sends two members to parliament. There are in it several large inns, and the market is well supplied with provisions. W. Long. 3. c. N. Lat. 51. 15.

BRIDLE, in the manege, a contrivance made of straps or thongs of leather and pieces of iron, in order to keep a horse in subjection and obedience.

The several parts of a bridle are the bit, or snaffle; the head-stall, or leathers from the top of the head to the rings of the bit; the fillet, over the forehead and under the fore-top; the throat-band, which buttons from the head-band under the throat; the reins, or long thongs of leather that come from the rings of the bit, and being cast over the horse's head, the rider holds them in his hand; the nose band, going through loops at the back of the head stall, and buckled under the cheeks; the trench; the cavetan; the martingal; and the chaff halter.

Pliny assures us that one Pelethronius first invented the bridle and saddle; though Virgil ascribes the invention to the Lapithæ, to whom he gives the epithet *Pelethronii*, from a mountain in Thessaly named

Pelethronium.

Bridgenorth
Bridle.

Bridon
||
Brieg.

Pelicionium, where horses were first begun to be broken.

The first horsemen, not being acquainted with the art of governing horses with bridles, managed them only with a rope or a switch, and the accent of the voice. This was the practice of the Numidians, Getulians, Libyans, and Massilians. The Roman youth also learned the art of fighting without bridles, which was an exercise or lesson in the manege; and hence it is, that on the Trajan column, soldiers are represented riding at full speed without any bridles on.

Scotling-BRIDLE. See BRANK.

BRIDON, or **SNAFFLE**, after the English fashion, is a very slender bit-mouth without any branches. The English make much use of them, and scarcely use any true bridles except in the service of war. The French call them *bridons*, by way of distinction from bridles.

BRIDLINGTON, a sea-port town in the east riding of Yorkshire in England. It is seated on a creek of the sea near Flamborough-head, having a commodious quay for ships to take in their lading. It has a safe harbour, and is a place of good trade. It is more generally known by the name of *Burlington*, as it gave title to an earl of that name, though the earldom is now extinct. E. Long. 0. 10. N. Lat. 54. 15.

BRIDPORT, a town of Dorsetshire in England. It has a low dirty situation between two rivers, which, at a little distance, joining a small stream, formerly made a convenient harbour; but is now quite choked up with sand. It sends two members to parliament, who are chosen by the inhabitants who are housekeepers. It is noted for making of ropes and cables for shipping; whence arises a proverb of a man that is hanged, that he is *stabbed with a Bridport dagger*. W. Long. 3. 0. N. Lat. 50. 40.

BBIEF, in law, an abridgment of the client's case, made out for the instruction of council on a trial at law; wherein the case of the plaintiff, &c. is to be briefly but fully stated: the proofs must be placed in due order, and proper answers made to whatever may be objected to the client's cause by the opposite side; and herein great care is requisite, that nothing be omitted, to endanger the cause.

BRIEF, in Scots law, a writ issued from the chancery, directed to any judge-ordinary, commanding and authorizing that judge to call a jury to inquire into the case mentioned in the brief, and upon their verdict to pronounce sentence.

Appostolical BRIEFS, letters which the pope dispatches to princes, or other magistrates, relating to any public affair.—These briefs are distinguished from bulls, in regard the latter are more ample, and always written on parchment, and sealed with lead or green wax; whereas briefs are very concise, written on paper, sealed with red wax, and with the seal of the fisherman, or St Peter in a boat.

BRIEG, a town of Silesia in Germany, situated in E. Long. 17. 35. N. Lat. 50. 40. It might have passed for a handsome place before the last siege; the castle, the college, and the arsenal, being very great ornaments, and most of the houses very well built. But the Prussians, who besieged it in 1741, threw 2172 bombs into it, and 4714 cannon bullets, which reduced a great part of the town to ashes, and quite ruined a

wing of the castle. It was obliged to surrender, after sustaining seven days continual fire. The Prussians, to whom this place was ceded by the peace, have augmented the fortifications, and built a new suburb.—The town stands upon the Oder; on the other side of which there are plenty of fallow-deer, and large forests of beech and oak trees. They have a yearly fair, at which they sell above 12,000 horned cattle. Since 1728, they have begun to manufacture fine cloth.

BRIEL, a maritime town of the United Provinces, and capital of the island of Vuorn. It was one of the cautionary towns which was delivered into the hands of queen Elizabeth, and garrisoned by the English during her reign and part of the next. The Dutch took it from the Spaniards in 1572, which was the foundation of their republic. It is seated at the mouth of the river Meuse, in E. Long. 3. 56. N. Lat. 51. 53.

BRIESCIA, a palatinate in the duchy of Lithuania, in Poland. The name given to it by some is *Polyssa*. It is bounded on the north, by Novogrode and Troki; on the west, by those of Biellko and Lublin; on the south, by that of Chelm and upper Volhinia; and on the east, by the territory of Rziczica. This province is of considerable extent from east to west, and is watered by the rivers Bug and Pripefe: it is full of woods and marshes; and there are lakes that yield large quantities of fish, that are salted by the inhabitants, and sent into the neighbouring provinces.

BRIEUX (St), a town of France, in upper Brittany, with a bishop's see. It is seated in a bottom, surrounded with mountains, which deprive it of a prospect of the sea, though it is not above a mile and a quarter from it, and there forms a small port. The churches, streets, and squares, are tolerably handsome; but the town is without walls and ditches. The church of Michael is in the suburb of the same name, and is the largest in the place. The convent of the Cordeliers is well built, and the garden is spacious. The college, which is very near, is maintained by the town for the instruction of youth. W. Long. 2. 58. N. Lat. 48. 33.

BRIG, or **BRIGANTINE**, a merchant-ship with two masts. This term is not universally confined to vessels of a particular construction, or which are masted and rigged in a manner different from all others. It is variously applied, by the mariners of different European nations, to a peculiar sort of vessel of their own marine. Amongst British seamen, this vessel is distinguished by having her mainmasts set nearly in the plane of her keel; whereas the mainmasts of larger ships are hung athwart, or at right angles with the ship's length, and fastened to a yard which hangs parallel to the deck: but in a brig, the foremost edge of the mainmast is fastened in different places to hoops which encircle the mainmast, and slide up and down it as the sail is hoisted or lowered: it is extended by a gaff above and a boom below.

BRIGADE, in the military art, a party or division of a body of soldiers, whether horse or foot, under the command of a brigadier.—An army is divided into brigades of horse and brigades of foot: a brigade of horse is a body of eight or ten squadrons; a brigade of foot consists of four, five, or six battalions. The eldest brigade has the right of the first line, and the second the right of the second; the two

Brieg
||
Brigade.

Briggs
||
Brigittine

next take the left of the two lines, and the youngest stand in the centre.

BRIGADIER-Major, is an officer appointed by the brigadier, to assist him in the management and ordering of his brigade.

BRIGADIER, is the general officer who has the command of a brigade. The eldest colonels are generally advanced to this post. He that is upon duty is brigadier of the day. They march at the head of their own brigades, and are allowed a serjeant and ten men of their own brigade for their guard — But the rank of brigadier general in the British service is now abolished.

BRIGADIERS, or *Sub-brigadiers*, are posts in the horse-guards.

BRIGANDINE, a coat of mail, a kind of ancient defensive armour, consisting of thin jointed scales of plate, pliant and easy to the body.

BRIGANTES, (Tacitus), a people of Britain, reaching from sea to sea, the whole breadth of the island, (Ptolemy). Now Yorkshire, Lancashire, Durham, Westmoreland, and Cumberland, (Camden). Also a people of Ireland, of uncertain position.

BRIGANTIA, or **BRIGANTIUM**, (anc. geog.), a town of Vindelicia; now *Bregentz*, in Tyrol, at the east end of the lake of Constance. — Another *Brigantium* in the Alps Cottia; which last is probably Briançon, a town on the borders of Dauphiny.

BRIGANTINE. See **BRIG**.

BRIGANTINUS LACUS, (anc. geog.), a lake of Rhetia, or Vindelicia which Tacitus includes in Rhetia. Ammian calls the lake *Brigantia*. It took its name either from the Brigantii, the people inhabiting on it, or from the adjoining town. Now the lake of *Constance*, or *Bodensee*.

BRIGANTINUS PORTUS, (anc. geog.), a port of the Isthmus of Spain; so called from Flavius Brigantium. Now *El Puerto de la Coruña*, commonly the *Groyne*.

BRIGG, by some called *Glanford Bridges*, a town of England, in Lincolnshire, seated on the river Ankaun. W. Long. 0. 20. N. Lat. 53. 40.

BRIGGS (Henry), one of the greatest mathematicians in the 16th century, was born at Warley Wood in the parish of Halifax in Yorkshire, in 1556. In 1592, he was made examiner and lecturer in mathematics, and soon after reader of the physic lecture founded by Dr Linaccer. When Gresham college in London was established, he was chosen the first professor of geometry there, about the beginning of March 1596. In 1609, Mr Briggs contracted an intimacy with the learned Mr James Usher afterwards archbishop of Armagh, which continued many years by letters, two of which, written by our author, are yet extant. In one of these letters, dated in August 1610, he tells his friend he was engaged in the subject of eclipses; and in the other, dated March 12th 1615, he acquaints him with his being wholly employed about the noble invention of logarithms, then lately discovered, in the improvement of which he had afterwards a large share. In 1619, he was made Savilian professor of geometry at Oxford; and resigned his professorship of Gresham college on the 25th of July 1620. Soon after his going to Oxford, he was incorporated master of arts in that university; where he continued till his death, which happened on the 26th of January 1630. Dr Smith

gives him the character of a man of great probity; a contemner of riches, and contented with his own station; preferring a studious retirement to all the splendid circumstances of life. He wrote, 1. *Logarithmorum chiliada prima*. 2. *Arithmetica logarithmica*. 3. *Trigonometria Britannica*. 4. A small tract on the north-west passage; and some other works.

BRIGGS (William), an eminent physician in the latter end of the 17th century, was the son of Augustin Briggs, Esq; four times member for the city of Norwich, where our author was born. He studied at the university of Cambridge; and his genius leading him to the study of physic, he travelled into France, where he attended the lectures of the famous anatomist M. Vieussens, at Montpellier. After his return, he published his *Ophthalmographia* in 1675. The year following he was created doctor of medicine at Cambridge, and soon after was made fellow of the college of physicians in London. In 1682, he quitted his fellowship to his brother; and the same year, his *Theory of vision* was published by Hooke. The ensuing year he sent to the royal society a continuation of that discourse, which was published in their Transactions; and the same year, he was by King Charles II. appointed physician to St Thomas's hospital. In 1684, he communicated to the royal society two remarkable cases relating to vision, which were likewise printed in their Transactions; and in 1685 he published a Latin version of his *Theory of vision*, at the desire of Mr Newton, afterwards Sir Isaac, professor of mathematics at Cambridge, with a recommendatory epistle from him prefixed to it. He was afterwards made physician in ordinary to King William, and continued in great esteem for his skill in his profession till he died September 4th 1704.

BRIGITTHELMSTONE, a sea-port town of Suffex in England. It is a pretty large and populous town, though ill built, and has a pretty good harbour. W. Long. 0. 10. N. Lat. 50. 50. It was at this place King Charles II. embarked for France, 1651, after the battle of Worcester. It has lately been considerably extended and embellished, in consequence of its having become a place of great resort for sea-bathing.

BRIGITTINS, or **BRIDGETINES**, more properly *Brigittine*, a religious order, denominated from their founder St Bridget or *Birgith*, a Swedish lady in the 14th century: whom some represent as a queen; but Fabricius, on better grounds, as a princess, the daughter of King Birgenes, legislator of Upland, and famous for her revelations. The Brigittins are sometimes also called the *Order of our Saviour*; it being pretended, that Christ himself dictated the rules and constitution observed by them to St Bridget. In the main, the rule is that of St Augustin; only with certain additions supposed to have been revealed by Christ, whence they also denominate it the *Rule of our Saviour*. — The first monastery of the Bridgetin order was erected by the foundress about the year 1344, in the diocese of Lineopen; on the model of which all the rest were formed. The constitution of these houses was very singular: though the order was principally intended for nuns, who were to pay a special homage to the holy Virgin, there are also many friars of it, to minister to them spiritual assistance. The number of nuns is fixed at 66 in each monastery, and that of friars at 13,

Brigade
||
Briggs

Brignoles—answerable to the number of apostles, of whom St Paul made the 13th; besides which there are to be four deacons, to represent the four doctors of the church, St Ambrose, St Augustine, St Gregory, and St Jerome; and eight lay-brothers; making together, says our author, the number of Christ's 72 disciples.—The order being instituted in honour of the Virgin, the direction is committed to an abbeys, who is superior not only of the nuns, but also of the friars, who are obliged to obey her. Each house consists of two convents or monasteries, separately inclosed, but having one church in common; the nuns being placed above, and the friars on the ground. The Bridgetins profess great mortification, poverty, and self-denial, as well as devotion; and they are not to possess any thing they can call their own, not so much as an halfpenny; nor even to touch money on any account. This order spread much thro' Sweden, Germany, the Netherlands, &c. In England we read but of one monastery of Brigittins, and this built by Henry V. in 1413, opposite to Richmond, now called *Sion house*; the ancient inhabitants of which, since the dissolution, are settled at Lisbon. The revenues were reckoned at 1495l. per annum.

BRIGNOLES, a town of France, in Provence, famous for its prunes. It is seated among mountains, in a pleasant country, 275 miles S. S. E. of Paris. E. Long. 6. 15. N. Lat. 43. 24.

BRIHUEGA, a town of Spain, in New Castile, where general Stanhope with the English army were taken prisoners, after they had separated themselves from that commanded by count Staremberg. It is seated at the foot of the mountain Tajuna, 43 miles north-east of Madrid. W. Long. 3. 20. N. Lat. 41. 0.

BRIL (Matthew and Paul), natives of Antwerp, and good painters.—Matthew was born in the year 1550, and studied for the most part at Rome. He was eminent for his performances in history and landscape, in the galleries of the Vatican; where he was employed by Pope Gregory XIII. He died in 1584, being no more then 34 years of age.—Paul was born in 1554; followed his brother Matthew to Rome; painted several things in conjunction with him; and, after his decease, brought himself into credit by his landscapes, but especially by those which he composed in his latter time. The invention of them was more pleasant, the disposition more noble, all the parts more agreeable, and painted with a better gusto, than his earlier productions in this way; which was owing to his having studied the manner of Hannibal Carrache, and copied some of Titian's works in the same kind. He was much in favour with Pope Sixtus V.; and for his successor Clement VIII. painted the famous piece, about 68 feet long, wherein the saint of that name is represented cast into the sea with an anchor about his neck. He died at Rome in the year 1626, aged 72.

BRILLIANT, in a general sense, something that has a bright and lucid appearance.

BRILLIANT, in the manege. A brisk, high mettled, stately horse is called *brilliant*, as having a raised neck; a fine motion; and excellent haunches, upon which he rises, though ever so little put on.

BRILLIANTS, a name given to diamonds of the finest cut. See DIAMOND.

BRIM, denotes the outmost verge or edge, especially of round things. The brims of vessels are made to project a little over, to hinder liquors, in pouring out, N^o. 54.

from running down the side of the vessel. The brimming of vessels was contrived by the ancient potters, in imitation of the supercilium or drip of the cornices of columns; it is done by turning over some of the double matter when the work is on the wheel.

BRIM, in country affairs. A sow is said to *brim*, or to go to *brim*, when she is ready to take the boar.

BRIMSTONE. See SULPHUR.

BRIMSTONE Medals, Figures, &c. may be cast in the following manner. Melt half a pound of brimstone over a gentle fire: with this mix half a pound of fine vermilion; and when you have cleared the top, take it off the fire, stir it well together, and it will dissolve like oil: then cast it into the mould, which should be first anointed with oil. When cool, the figure may be taken out; and in case it should change to a yellowish colour, you need only wipe it over with aqua fortis, and it will look like the finest coral †.

BRIN, a strong town of Bohemia, in Moravia. It is pretty large, and well built: the assembly of the states is held alternately there and at Olmutz. The castle of Spilberg is on an eminence, out of the town, and is its principal defence. It was invested by the king of Prussia in 1742, but he was obliged to raise the siege. It is near the river Swart, in E. Long. 7. 8. N. Lat. 49. 8.

BRINDISI, an ancient celebrated town of Italy, in the Terra d'Otranto, and kingdom of Naples, with an archbishop's see. Its walls are still of great extent, but the inhabited houses do not fill above half the enclosure. The streets are crooked and rough; the buildings poor and ruinous; no very remarkable church or edifice. The cathedral, dedicated to St Theodore, is a work of king Roger, but not equal in point of architecture to many churches founded by that monarch, who had a strong passion for building. Little remains of ancient Brundisium, except innumerable broken pillars, fixed at the corners of streets to defend the houses from carts; fragments of coarse Mosaic, the floors of former habitations; the column of the lighthouse; a large marble basin, into which the water runs from brazen heads of deer; some inscriptions, ruins of aqueducts, coins, and other small furniture of an antiquary's cabinet. Its castle, built by the emperor Frederick II. to protect the northern branches of the harbour, is large and stately. Charles V. repaired it. The port is double, and the finest in the Adriatic. The outer part is formed by two promontories, which stretch off gradually from each other as they advance into the sea, leaving a very narrow channel at the base of the angle. The island of St Andrew, on which Alphonus I. built a fortress, lies between the capes, and secures the whole road from the fury of the waves. In this triangular space, large ships may ride at anchor. At the bottom of the bay the hills recede in a semicircular shape, to leave room for the inner haven; which, as it were, clasps the city in its arms, or rather encircles it, in the figure of a stag's head and horns. This form is said to have given rise to the name of *Brun. i. s. juun*, which, in the old Messapian language, signified *the head of a deer*. In ancient days, the communication between the two havens was marked by lights placed upon columns of the Corinthian order, standing on a rising ground, in a direct line with the channel.

Of these one remains entire upon its pedestal. Its capital

Brignoles
Brim.

Brim
Brindisi.

Drillington's
Lis.

Smith's
Laboratory,
p. 3.

capitals is adorned with figures of Syrens and Tritons, intermingled with the acanthus leaf, and upon it a circular vase, which formerly held the fire. A modern inscription has been cut upon the plinth. Near it is another pedestal of similar dimensions, with one piece of the shaft lying on it. The space between these pillars answered to the entrance of the harbour. "The whole kingdom of Naples (says Mr Swinburne) cannot show a more complete situation for trade than Brindisi. Here goodness of soil, depth of water, safety of anchorage, and a central position, are all united; yet it has neither commerce, husbandry, nor populousness. From the obstructions in the channel, which communicates with the two havens, arises the tribe of evils that afflict and desolate this unhappy town. Julius Cæsar may be said to have begun its ruin, by attempting to block up Pompey's fleet. He drove piles into the neck of land between the two ridges of hills; threw in earth, trees, and ruins of houses; and had nearly accomplished the blockade, when Pompey failed out and escaped to Greece. In the 15th century, the prince of Taranto sunk some ships in the middle of the passage, to prevent the royalists from entering the port, and thereby provided a resting place for sea-weeds and sand, which soon accumulated, choked up the mouth, and rendered it impracticable for any vessels whatsoever. In 1752 the evil was increased, so as to hinder even the waves from beating through; and all communication was cut off, except in violent easterly winds or rainy seasons, when an extraordinary quantity of fresh water raises the level. From that period the port became a fetid green lake, full of infection and noxious insects; no fish but eels could live in it, nor any boat ply except canoes made of a single tree. They can hold but one person, and overset with the least irregularity of motion. The low grounds at each end were overflowed and converted into marshes, the vapours of which created every summer a real pestilence; and in the course of very few years, swept off or drove away the largest portion of the inhabitants. From the number of eighteen thousand, they were reduced in 1766 to that of five thousand livid wretches, tormented with agues and malignant fevers. In 1775 above fifteen hundred persons died during the autumn; a woful change of climate! Thirty years ago, the air of Brindisi was esteemed so wholesome and balsamic, that the convents of Naples were wont to send their consumptive friars to this city for the recovery of their health. This state of misery and destruction induced the remaining citizens to apply for relief to Don Carlo Demarco, one of the king's ministers, and a native of Brindisi. In consequence of this application, Don Vito Caravelli was ordered to draw up plans, and fix upon the means of opening the port afresh: Don Andrea Pignonati was last year sent to execute his projects; and, by the help of machines and the labour of the galley-slaves, has succeeded in some measure. The channel has been partly cleared, and has now two fathom of water. It can admit large boats, a great step towards the revival of trade; but what is of more immediate importance, it gives a free passage to the sea, which now rushes in with impetuosity, and runs out again at each tide; so that the water of the inner port is set in motion, and once more rendered wholesome. The canal or gut is to be seven hundred yards long,

and drawn in a straight line from the column. At present its parapets are defended by piles and fascines; but if the original plan be pursued, stone piers will be erected on both sides. When the canal shall be scooped out to a proper depth, and its piers solidly established, vessels of any burden may once more enter this land-locked port, which affords room for a whole navy. Docks wet and dry may be dug, goods may be shipped at the quay, and convenient watering-places be made with great ease. If merchants should think it a place of rising trade, and worthy of their notice, there is no want of space in the town for any factory whatever. Circulation of cash would give vigour to husbandry, and provisions would soon abound in this market. The sands at the foot of the hills, which form the channel, are to be laid out in beds for muscles and oysters. Some ecclesiastics are raising nurseries of orange and lemon trees; and other citizens intend introducing the cultivation of mulberry-trees, and breeding of silk-worms. The engineer would have done very little for the health of Brindisi, had he only opened a passage, and given a free course to the waters; the marshes at each extremity of the harbour would still have infected the air: he, therefore, at the expence of about a thousand ducats, had the fens filled up with earth, and a dam raised to confine the waters, and prevent their flowing back upon the meadows. The people of Brindisi, who are sensible of the blessings already derived from these operations, who feel a return of health, and see an opening for commerce and opulence, seem ready to acknowledge the obligation. They intend to erect a statue to the king, with inscriptions on the pedestal in honour of the minister and agents. The workmen, in cleaning the channel, have found some medals and seals, and have drawn up many of the piles that were driven in by Cæsar. They are small oaks stripped of their bark, and still as fresh as if they had been cut only a month, though buried above eighteen centuries seven feet under the sand. The soil about the town is light and good. It produces excellent cotton, with which the Brindisians manufacture gloves and stockings.

"It is impossible to determine who were the founders of Brundisium, or when it was first inhabited. The Romans took early possession of a harbour so convenient for their enterprises against the nations dwelling beyond the Adriatic. In the year of Rome 509, they sent a colony hither. Pompey took refuge here; but finding his post untenable, made a precipitate retreat to Greece. In this city Octavianus first assumed the name of *Cæsar*, and here he concluded one of his short-lived peaces with Antony. Brundisium had been already celebrated for giving birth to the tragic poet Pacuvius, and about this time became remarkable for the death of Virgil. The barbarians, who ravaged every corner of Italy, did not spare so rich a town; and, in 836, the Saracens gave a finishing blow to its fortunes. The Greek emperors, sensible of the necessity of having such a port as this in Italy, would have restored it to its ancient strength and splendor, had the Normans allowed them time and leisure. The Greeks struggled manfully to keep their ground; but, after many varieties of success, were finally driven out of Brindisi by William I. The frenzy for expeditions to Palestine, though it drained other kingdoms of their

Brinley. wealth and subjects, contributed powerfully to the establishment of this city, one of the ports where pilgrims and warriors took shipping. It also benefited by the residence of the emperor Frederick, whose frequent armaments for the Holy Land required his presence at this place of rendezvous. The loss of Jerusalem, the fall of the Grecian empire, and the ruin of all the Levant trade after the Turks had conquered the East, reduced Brindisi to a state of inactivity and desolation, from which it has never been able to emerge." E. Long. 18. 5. N. Lat. 40. 52.

BRINLEY (James), a most uncommon genius for mechanical inventions, and particularly excellent in planning and conducting inland navigations, was born, 1716, at Tunsted in Derbyshire. Through the mismanagement of his father (for there was some little property in his house) his education was totally neglected; and, at seventeen, he bound himself apprentice to a mill-wright, near Macclesfield, in Cheshire. He served his apprenticeship; and, afterwards, setting up for himself, advanced the mill-wright business, by inventions and contrivances of his own, to a degree of perfection which it had not attained before. His fame, as a most ingenious mechanic, spreading widely, his genius was no longer confined to the business of his profession: for, in 1752, he erected a very extraordinary water-engine at Clifton, in Lancashire, for the purpose of draining coal-mines; and, 1755, was employed to execute the larger wheels for a new silk-mill, at Congleton, in Cheshire. The potteries of Staffordshire were also, about this time, indebted to him for several valuable additions in the mills used by them for grinding flint-stones. In 1756, he undertook to erect a steam-engine near Newcastle under Line upon a new plan; and it is believed that he would have brought this engine to a great degree of perfection, if some interested engineers had not opposed him.

His attention, however, was soon afterwards called off to another object, which, in its consequences, hath proved of high importance to trade and commerce; namely, the projecting and executing "Inland navigations." By these navigations the expence of carriage is lessened; a communication is opened from one part of the kingdom to another, and from each of these parts to the sea; and hence products and manufactures are afforded at a moderate price. The duke of Bridgewater hath, at Worsley, about seven miles from Manchester, a large estate abounding with coal, which had hitherto lain useless, because the expence of land-carriage was too great to find a market for consumption. The duke, wishing to work these mines, perceived the necessity of a canal from Worsley to Manchester; upon which occasion Brindley, now become famous, was consulted; and declaring the scheme practicable, an act for this purpose was obtained in 1758 and 1759. It being, however, afterwards discovered, that the navigation would be more beneficial, if carried over the river Irwell to Manchester, another act was obtained to vary the course of the canal agreeably to the new plan, and likewise to extend a side-branch to Longford-bridge in Stretford. Brindley, in the mean time, had begun these great works, being the first of the kind ever attempted in England, with navigable subterraneous tunnels and elevated aqueducts; and as, in order to preserve the level of the water, it should be free from

Brinley. the usual obstructions of locks, he carried the canal over rivers, and many large and deep vallies. When it was completed as far as Barton, where the Irwell is navigable for large vessels, he proposed to carry it over that river, by an aqueduct of thirty-nine feet above the surface of the water; and though this project was treated as wild and chimerical, yet, supported by his noble patron, he began his work in Sept. 1760, and the first boat sailed over it in July 1761. The duke afterwards extended his ideas to Liverpool; and obtained, in 1762, an act for branching his canal to the tideway in the Mersey: this part of the canal is carried over the rivers Mersey and Bollan, and over many wide and deep vallies.

The success of the duke of Bridgewater's undertakings encouraged a number of gentlemen and manufacturers in Staffordshire, to revive the idea of a canal-navigation through that county; and Brindley was, therefore, engaged to make a survey from the Trent to the Mersey. In 1766, this canal was begun, and conducted under Brindley's direction as long as he lived; but finished after his death by his brother-in-law Mr Henshall, of whom he had a great opinion, in May 1777. The proprietors called it, "the canal from the Trent to the Mersey;" but the engineer, more emphatically, "the Grand Trunk Navigation," on account of the numerous branches, which, as he justly supposed, would be extended every way from it. It is 93 miles in length; and, besides a large number of bridges over it, has 76 locks and five tunnels. The most remarkable of the tunnels is the subterraneous passage of Harecastle, being 2880 yards in length, and more than 70 yards below the surface of the earth. The scheme of this inland-navigation had employed the thoughts of the ingenious part of the kingdom for upwards of 20 years before; and some surveys had been made: but Harecastle hill, through which the tunnel is constructed, could neither be avoided nor overcome by any expedient the most able engineers could devise. It was Brinley alone who surmounted this and other the like difficulties, arising from the variety of strata and quicksands, as no one but himself would have attempted to conquer.

Brinley was engaged in many other similar undertakings, for a fuller account of which, not being consistent with our plan, we refer the reader to the "Biographia Britannica;" or rather to a curious and valuable pamphlet, published some years since, and intitled, "The History of Inland-Navigations, particularly that of the Duke of Bridgewater." He died at Turnhurst in Staffordshire, Sept. 27th, 1772, in his 56th year: somewhat immaturity, as it should seem; but he is supposed to have shortened his days by too intense application, and to have brought on a hectic fever, which continued on him for some years before it consumed him. For he never indulged and relaxed himself in the common diversions of life, as not having the least relish for them; and, though once prevailed on to see a play in London, yet he declared that he would on no account be present at another; because it so disturbed his ideas for several days after, as to render him unfit for business. When any extraordinary difficulty occurred to him in the execution of his works, he generally retired to bed; and has been known to lie there one, two, or three days, till he has surmounted it. He would

Brine. would then get up, and execute his design without any drawing or model: for he had a prodigious memory, and carried every thing in his head.

As his station in life was low, and his education totally neglected, so his exterior accomplishments were suitable to them. He could indeed read and write, but both very indifferently; and he was perhaps, in his way, as *abermis sapiens*—"of mother-wit, and wife without the schools"—as any man that ever lived. "He is as plain a looking man as one of the boors in the Peake, or one of his own carters: but when he speaks, all ears listen; and every mind is filled with wonder, at the things he pronounces to be practicable." The same author gives us also no ungracious idea of his moral make: "being great in himself, he harbours no contracted notions, no jealousy of rivals: he conceals not his methods of proceeding, nor asks patents to secure the sole use of the machines, which he invents and exposes to public view. Sensible that he must one day cease to be, he selects men of genius, teaches them the power of mechanics, and employs them in carrying on the various undertakings in which he is engaged. It is not to the duke of Bridgewater only that his services are confined: he is of public utility, and employs his talents in rectifying the mistakes of despising workmen, &c. His powers shine most in the midst of difficulties; when rivers and mountains seem to thwart his designs, then appears his vast capacity, by which he makes them subservient to his will."

BRINE, or PICKLE; water replete with saline particles.

Brine taken out of brine-pits, or brine-pans, used by some for curing or pickling of fish, without boiling the same into salt; and rock-salt, without refining it into white-salt; are prohibited by 1 Ann. cap. 21.

Brine is either native, as the sea-water, which by coction turns to salt; or facitious, formed by dissolving salt in water. In the salt works at Upwick in Worestershire, there are found, at the same time, and in the same pit, three sorts of brine, each of a different strength. They are drawn by a pump; and that in the bottom, first brought up, is called *first man*; the next, *middle man*; and the third, *last man*.

Leach Brine, a name given to what drops from the corned salt in draining and drying, which they preserve and boil again; being stronger than any brine in the pit. There is sand found in all the Staffordshire brines after coction; but naturalists observe, it did not pre-exist in the water, but rather is the product of the boiling. Some steep their seed-wheat in brine, to prevent the smut. Brine is also commended as of efficacy against gangrenes.

BRINE also denotes a pickle pregnant with salt, wherein things are steeped to keep.

Brine-pans, the pits wherein the salt-water is retained, and subsided to stand, to bear the action of the sun, whereby it is converted into salt. There are divers sorts of salt pans, as the water-pan, second pan, sun-pan; the water being transferred orderly from one to another.

Brine-pit, in salt-making, the salt spring from whence the water to be boiled into salt is taken. There are of these springs in many places; that at Namp-

wich, in Cheshire, is alone sufficient, according to the account of the people of the place, to yield salt for the whole kingdom; but it is under the government of certain lords and regulators, who, that the market may not be overstocked, will not suffer more than a certain quantity of the salt to be made yearly. See the next article.

Brine Springs, are fountains which flow with salt-water instead of fresh. Of these there are a good number in South Britain, but though not peculiar to this island, are far from being common in the countries on the continent. There are some of them in several different counties; and perhaps, on a due search, others might be discovered*. The most remarkable of these already known are, one at East-Chenock in Somersetshire, about 20 miles from the sea. Another at Leamington in Warwickshire, very near the river Leam; which, however, is but weak. Such a spring likewise runs into the river Cherwell in Oxfordshire, and several more in Westmoreland and Yorkshire: but as they are but poor, and the fuel in most of those counties scarce and dear, no salt is prepared from them. At Barrowdale near Grange, three miles from Keswick in Cumberland, a pretty strong spring rises in a level near a moss, 16 gallons of the water of which yield one of pure salt; which is the more remarkable, when it is considered that the same quantity of salt cannot be obtained from less than 22 gallons of the waters of the German ocean. At a place called *Salt-water Haugh*, near Butterpy, in the bishopric of Durham, there are a multitude of salt springs which rise in the middle of the river Weare, for the space of about 40 yards in length, and ten in breadth; but particularly one out of a rock, which is so strong that in a hot summer's day the surface will be covered with a pure white salt. At Wellon, in Staffordshire, there are brine pits which afford about a ninth part of very fine white salt. There are others at Enson, St Thomas, and in the parish of Inglestre, but so weak that they are not wrought; though it is believed, that by boring, stronger springs might be found in the neighbourhood. In Lancashire there are several salt springs, but (it we except that at Barton, which is as rich as the spring at Norwich) by no means so famous as those of Cheshire, called in general by the name of the *weiches*. Nantwich on the river Weaver, has a noble spring not far from the river, which is so rich as to yield one sixth-part of pure white salt. At six miles distance stands Northwich, at the confluence of the Weaver and the Dan; where the brine is still richer, since they obtain six ounces of salt from 16 of water. There are, even at this day, some visible remains of a Roman causeway between these two towns. The inhabitants of Wales, who, before that country was incorporated into England, were supplied chiefly, if not solely, with that necessary commodity from these two towns, called the former *Hallath Wen*, and the latter *Hallath Du*; i. e. the white and black salt pit. In 1670, a rock of salt was discovered at a small distance from Norwich, which has been wrought to a great depth, and to a vast extent, so as to be justly esteemed one of the greatest curiosities in England; and it is highly probable, that there is an immense body of fossil salt in the bowels of the earth, under this whole county; since, upon boring, brine pits have been found in many

Brine.

Bring
||
Brioude.

places on both sides the river Wzever. This is the more likely, since, at Middlewich, which stands at the confluence of the Croke and the Daan, there are salt-springs with a fresh brook running between them. The brines from these pits are of unequal strength; but when mixed, they commonly oftain four ounces of salt from a pound of brine. Experience shows, that in these springs the water is strongest nearest the bottom, richer in dry weather than in wet, and when long drawn than when first wrought. But these are no rules in respect to other salt-springs, since in those of Franche Compte the brine is strongest in wet weather. There are several other bodies dissolved in these brines besides salt; in some a sulphureous substance, which sublimes as the brine heats; a sort of dirty ochre which discolours the brine, but, if suffered to stand, speedily subsides; and in most brines a calcareous, or rather selenitic earth, which settles to the bottom of the pans†.

† See Salt,
and Springs.

7^o BRING-TO, in navigation, to check the course of a ship when she is advancing, by arranging the sails in such a manner, that they shall counteract each other, and prevent her either from retreating or moving forward. In this situation the ship is said to lie by, or lie to; having, according to the sea-phuase, some of her sails *aback*, to oppose the force of those which are full; or having them otherwise shortened by being *starled*, or *hauled up in the brails*.

BRINGING-TO, is generally used to detain a ship in any particular station, in order to wait the approach of some other that may be advancing towards her; or to retard her course occasionally near any port in the course of a voyage.

BRINGING-IN a Horse, in the manege, the same as to *fy*, keep down the nose of a horse that boars and tosses his nose in the wind; this is done by means of a branch.

BRINING OF CORN, in husbandry, an operation performed on the wheat seed, in order to prevent the smut. Alqoristo be prepared for this purpose, by putting 70 gallons of water into a tub (like a wash-tub used for brewing), and a corn-bushel of unslaked lime-stone. This is to be well stirred till the whole is dissolved, and left to stand for 30 hours; after which it is to be drained off into another tub, in the manner practised for beer. In this way about a hoghead of strong lime-water will be obtained, to which must be added three pecks of salt. The wheat must be steeped in this pickle, by running it gently, and in small quantities, into a broad-bottomed basket of about 24 inches in diameter, and 20 inches deep, and stirring it. The light feed that floats must be strained off with a strainer, and must not be sown. When the basket has been drawn up, and drained of the pickle, the wheat will be fit for sowing in two hours after the brining.

BRINING of hay-ricks, a practice common in America, of mixing salt with the hay as it is stacked.

BRIONNE, a town of France, in Normandy, seated on the river Rille. E. Long. 0. 51. N. Lat. 49. 51.

BRIOUDE, a town of France, in lower Auvergne. There are two Brioudes, three quarters of a mile from each other; the one is called *Church Brioude*, the other *Old Brioude*. The houses are built after the antique manner, and are badly disposed. The canoys are all temporal lords and counts. It is in no diocese, but de-

pends immediately on the Pope. There are several convents; and, among the rest, the church of St Ferrol, which is highly celebrated. Near the Old Town is a stone-bridge on the river Allier, which consists of one arch: this is esteemed a stupendous structure, and is thought to be a work of the Romans. The inhabitants have no manufactures. It is situated in E. Long. 3. 25. N. Lat. 45. 14.

BRIQUERAS, a town in Piedmont, seated in the valley of Lucern, three miles from the town of that name, and four fourth of Pignerol. It had a very strong castle towards the latter end of the 16th century; but when the French got footing in it, it was ruined, that is, before they delivered it up to the duke of Savoy in 1696. E. Long. 7. 24. N. Lat. 44. 41.

BRISACH, a town of Germany, and capital of Brisgaw. It was twice in possession of the French; but restored to the house of Austria, in consequence of treaties of peace. It was a very strong place, but the fortifications have been demolished. It is seated on the Rhine, where there is a bridge of boats. E. Long. 7. 49. N. Lat. 48. 5.

BRISACH (New), a town of France, in Alsace, built by order of Louis XIV. over against Old Brisach, and fortified by Vauban. It is 32 miles south of Strasburg. E. Long. 7. 46. N. Lat. 48. 5.

BRISEIS, or **HIPPODAMIA**, in fabulous history, the wife of Mynes king of Lyrnessa. After Achilles had taken that city, and killed her husband, she became his captive. That hero loved her tenderly; but Agamemnon taking her from him, she became the accidental cause of numberless disorders in the Grecian army. Achilles, enraged, retired to his tent; and, till the death of Patroclus, refused to fight against the Trojans. The resentment of this prince is finely painted in the Iliad.

BRISGAW, a territory of Germany, in the circle of Suabia, on the eastern banks of the Rhine, about 50 miles in length, and 50 in breadth. The principal places are Old Brisach, New Brisach, Freyburgh, Rhinmarck, and an island in the Rhine.

BRISIACUS MONS (anc. geog.), a town on the right or east side of the Rhine. Now *Brisac*, situate on a round hill; a fortified town of Suabia, and distinguished by the name of *Old Brisac*. E. Long. 7. 15. Lat. 48. 10.

BRISSOT (Peter), one of the ablest physicians of the 16th century, was born at Fontenai le Comte in Poitou. He studied at Paris; and, having taken his doctor's degree, bent his thoughts to the reforming of physic, by restoring the precepts of Hippocrates and Galen, and exploding the maxims of the Arabians: to this purpose he publicly explained Galen's works, instead of those of Avicenna, Rhafis, and Meffue. He afterwards resolved to travel to acquire the knowledge of plants: and going to Portugal, practised physic in the city of Eboræ. His new method of bleeding in pleurisies, on the side where the pleurisy was, raised a kind of civil war among the Portuguese physicians; it was brought before the university of Salamanca, who at last gave judgment, that the opinion ascribed to Brissot was the pure doctrine of Galen. The partizans of Denys, his opponent, appealed in 1529 to the emperor, to prevent the practice, as being attended with destructive consequences; but Charles III. duke of Savoy hap-

pening to die at this time of a pleurisy, after having been bled on the opposite side, the prosecution dropped. He wrote an Apology for his practice; but died before it was published, in 1552; but Anthony Lucas, his friend, printed it at Paris three years after. Renatus Moreau procured a new edition of it at Paris in 1622; and annexed to it a treatise intitled *De nuphone sanguinis in pleuritide*, together with the Life of Bristol.

BRISTLE, a rigid glossy kind of hair found on swine, and much used by brush-makers, &c.

BRISTOL, a city of England, and inferior to none, except London, for wealth, trade, and number of inhabitants. Bristol is a corruption of *Brighton*, as it was called by the Saxons. It is thought to have stood anciently altogether on the west or Somersetshire side of the Avon, before the bridge was built; but after that, it came to be partly in Somersetshire and partly in Gloucestershire, until it was made a county of itself, though even before that, in the parliament rolls, it was always placed in Somersetshire. At present, the east side is by much the largest and most populous. It had anciently a castle, built by Robert earl of Gloucester, natural son to Henry I. which was demolished by Cromwell; and the ground is now laid out into streets. The corporation consists of a mayor; recorder; twelve aldermen, of whom the recorder is one; two sheriffs; and twenty-eight common-council men. The recorder is generally a serjeant at law, and sits as judge in capital and all other criminal causes. The mayor, to support his dignity, and defray his extraordinary expence, is intitled to certain fees from ships, which long ago amounted to L.500 or L.600. Bristol is a bishop's see, being one of the six erected by King Henry VIII. out of the spoils of the monasteries and religious houses which that monarch had got dissolved. The cathedral church was the church of the abbey of St Austin in Bristol, founded by Robert Fitzharding son to a king of Denmark, once a citizen here, by him filled with canons regular in the year 1148. At the reformation King Henry VIII. placed therein a dean and six prebendaries, which mode of government still continues. During a great part of Queen Elizabeth's reign, his see was held *in commendam* by the bishop of Gloucester. This diocese was formed chiefly out of the diocese of Salisbury, with a small part from the dioceses of Wells and Worcester. It contains most of the city of Bristol, and all the county of Dorset, in which are 236 parishes, of which 64 are impropriated. It hath only one archdeaconry, viz. of Dorset; is valued in the king's books L.338:8:4, and is computed to be annually worth L.1500, including its *commendams*. The tenth of the clergy, L.353, 18s. 6d. This see hath yielded to the late one Lord Privy Seal. The revenues of the abbey of St Augustine, or St Austin, in Bristol, was valued at the dissolution at L.670:13:11, when it was erected into a cathedral by King Henry VIII. by the name of the *Cathedral Church of the Holy Trinity*. To this cathedral belongs a bishop, a dean, an archdeacon, a chancellor, six prebendaries, and other inferior officers and servants. Besides the cathedral, there are 18 parish-churches; and here are dissenters of all denominations, of whom the quakers are very respectable both for their wealth and numbers. Of the parish-churches,

Bristol.

St Mary Ratcliff is reckoned one of the finest, not only here, but in the whole Kingdom. In this church, besides two monuments of the founder William Cunninges, who had been five times mayor of this city, one in the habit of a magistrate, and another in that of a priest (for in his latter days he took orders), there is one of Sir William Penn, father to the famous quaker. The old bridge over the Avon consisted of four broad arches, with houses on both sides like those formerly on London bridge; but this has been lately pulled down, and another erected in its place. No carts or waggons are admitted into Bristol, for fear of damaging the vaults and gutters made under ground for carrying the filth of the city into the river. Queen's-square, in this city, is larger than any in London, except Lincoln's-inn-fields, and has in the centre an equestrian statue of King William III. All the rates of the city remain entire, and a part of the walls; the rest were razed in the reign of William Rufus. It is almost as broad as long, about seven miles in circumference, and contains about 9,000 inhabitants. Of the hospitals, the chief are, 1. That called Queen Elizabeth's, in which 100 boys are taught reading, writing, arithmetic, and navigation; six of whom, when they go out, have L.10, and the rest L.8, 8s. to bind them apprentices; the master is allowed L.450 a-year for the maintenance of the boys. 2. Colton's hospital; in which 100 boys are maintained for seven years, and taught and apprenticed, as in Queen Elizabeth's. 3. Another founded by the same gentleman in 1691, for 12 men and 12 women, with an allowance of 3s. per week, and 24 bushels of coals in the year. This charity cost the founder L.25,000. 4. Another founded partly by Mr Colton and partly by the merchants, in which 18 men on account of the merchants, and 12 men and women on account of Mr Colton, are maintained. 5. An infirmary, which was opened in 1736 for the sick, lame, and distressed poor of the city, which is maintained by subscription, besides L.5000 bequeathed to it by John Eldridge, Esq. formerly comptroller of the customs at this port. There are, besides these, a bridewell, several alms-houses, and charity-schools. There is also a guildhall for the sessions and assizes; the mayor's and sheriffs' court; a council-house, where the mayor and aldermen meet every day, except Sundays, to administer justice; a handsome new exchange, with three entrances, about two-thirds as large as that in London; and a quay half a mile in length, the most commodious in England for shipping and landing goods, for which purpose it is provided with several cranes. In College-green is a stately high cross, with the effigies of several kings round it. In Wind-street is a guard-house, with barracks for soldiers. As to the trade of this city, it was computed many years ago to be much greater in proportion, especially to America and the West Indies, than that of London. Fifty sail, some of them ships of considerable burden, have arrived here at one time, or very near one another, from the West Indies. For this trade, and that to Ireland, it is much better situated than London, besides the great advantages it possesses of an inland navigation by the Wye and Severn. Their trade extends to the Baltic, Norway, Holland, Hamburg, Guinea, and the Straits. The largest ships are discharged at Hinton, four miles below the city, and the goods are brought to the quay by lighter.

For

Bristol.

For building, equipping, and repairing ships, there are docks, yards, rope-walks, and ship-wrights. Here are some considerable woollen manufactures; and no less than 15 glass-houses, for which Kingwood and Mendip furnish the coals. The city companies are 13: 1. The merchant adventurers. 2. The merchant tailors. 3. The mercers. 4. The soap boilers. 5. The tobacconists. 6. The butchers. 7. The barbers. 8. The tylers. 9. The holliers, who are the sled-men. 10. Shoemakers. 11. Coopers. 12. Bakers. 13. Smiths. For supplying the city with water there are six public conduits; and handsome hackney-coaches may be hired at very reasonable rates, but they do not ply in the streets. There are also stage-coaches, which set out every day for Bath, London, and other places. A mile below the city, close by the river, is the hot well, whose waters are specific for the diabetes, and good in phthisical, scorbutic, and inflammatory disorders. Hither is a great resort in the summer of invalids, as well as other company; for whose accommodation and entertainment there is a pump-room, ball room, coffee-house, with taverns, and a great number of elegant lodging-houses, both below on a level with the well, and above in the delightful village of Clifton, which is situated on the brow of a hill, from whence there are downs extending several miles, where the company ride out for exercise. Nothing can be more pure and salutary than the air of these downs, which afford a variety of the most romantic and agreeable prospects, comprehending Kingroad, with the ships at anchor, the mouth of the Severn, and the mountains of Wales. In the rocks above the well are found those six-cornered stones called *Bristol-stones*; but they are not so plentiful now as in Camden's days, when, he says, whole bushels might have been easily gathered. In this city is a theatre, where plays are acted almost every night during the recess of the comedians from the metropolis. There are two annual fairs, to which the concourse is so great, that the neighbouring inns have filled 100 beds a-piece with their guests. In the winter season there is an assembly every Thursday for the gayer part of the citizens of both sexes. About half way betwixt Bristol and Bath, at a place called *Warrily*, a company of Bristol merchants have erected a noble manufacture of pins and other brass utensils, which employs a great number of hands, including about 200 children of both sexes from seven to twelve or thirteen years of age. All the different operations of melting, splitting, drawing, hammering, turning, &c. are performed by wheels worked with water, which is raised by two fire-engines of a very curious mechanism. The city of Bristol gives the title of earl to the family of Hervey, and sends two members to parliament. It is worth observing, that whoever marries a citizen's daughter becomes free of the city.

New Bristol, the capital of the county of Bucks in Pennsylvania, situated on the river Delaware, about 20 miles north of Philadelphia, in W. Long. 75. N. Lat. 40. 45.

Bristol Water. Of the four principal warm waters naturally produced in England this is the least so. As the Bath waters are proper where the secretions are defective, so the Bristol water is of service where they exceed the requirements of health. The Bath water warms; the Bristol cools. Bath water helps the sto-

Britain.

mach, intestines, and nerves; the Bristol favours the lungs, kidneys, and bladder. Except a jaundice attend, the Bristol water may be of use in dropsies by its drying and diuretic qualities. Dr Wynter asserts, that there is no iron in Bristol water; and that its mineral contents are chalk, lapis calcareus, and calaminaris. Five gallons of this water, after evaporation, afforded only 3 iii. and gr. ii. of a mineral-like substance. The diseases in which this water is useful are internal hæmorrhagies, immoderate menfes, internal inflammations, spitting blood, dysentery, purulent ulcers of the viscera, consumption, dropsy, scurvy with heat, stone, gravel, strangury, habitual gout, atrophy, slow fever, serophula, gleet, and diabetes, in which last it is a specific, and may be drank as freely as the thirst requires it. The hotter months are the best for using it. The Bristol and Matlock waters are of exactly the same qualities. Doctors Mead and Lane first established the reputation of Bristol waters in diseases of the kidneys and bladder.

BRITAIN, or GREAT BRITAIN, the most considerable of all the European islands, extends from the Lizard Point, in the latitude of about 50° to Dunstaff-head in latitude 58. 30. N. or, taking it in a straight line from north to south, about eight degrees or 550 miles; and from Dover head on the east to Land's-end on the west comprehends about seven degrees of longitude, which may be computed at about 290 miles: but the form being very irregular, and lessening continually towards the north, proper allowances must be made in computing its dimensions.

The ancient name of this island was *Albion*, the name ¹ *Albion* the *Britain* being then common to all the islands round it. ^{ancient name.} Hence Agathemerus, speaking of the British islands, "They are many in number (says he); but the most considerable among them are Hibernia and Albion." And Ptolemy, to the chapter wherein he describes the island now called *Great Britain*, prefixes the following title: "The situation of *Albion* a British island." But as this far excelled the other British islands, the name of *Albion* in process of time was laid quite aside, and that of *Britain* used in its stead. By this name it was known in Pliny's time, and even in Cæsar's. The origin ² of both these names is very uncertain. Some derive it ^{origin of the different names.} of Albion from the Greek word *alphon*, which, according to Festus, signifies *white*, the chalky cliffs that in several places rise on the southern coasts having that colour; while others pretend this name to have been borrowed from a giant feigned to have been the son of Neptune, and mentioned by several ancient authors. Some etymologists have recourse to the Hebrew, and others to the Phœnician; *alben* in the former signifying *white*, and *alp* in the latter signifying *high*. The origin of the name *Britain* is no less uncertain than that of *Albion*. Nennius and some other British writers derive it from Brutus, whom they likewise call *Brito*, the fifth in descent from the celebrated Æneas. Others derive it from the British words *pryd cain*, that is, a *white foun*, softened by degrees into *Britannia*. Camden derives it from the word *brith*, which, in the ancient language of the island, signifies *painted*; and *tania*, importing, in Greek, a region or county; so that the word *Brithania*, changed in process of time into *Britannia*, expresses what the Britons really were, that is, *painted*. Somner, disliking Camden's etymology,

Britain.

gy, proposes another, viz. that the name *Britain* comes from *brydis*; signifying, in the British tongue, *rage*, and pointing out the violent motion of the sea that surrounds the island. Mr Whittaker, in his History of Manchester, derives it from the word *brith, brit, brit, bris, or brig*, which, he says, signifies *divided or separated*. Against the first of these etymologies it may be objected, that it is founded on a fable: and against the other four lies one common and unanswerable objection; which is, that the name of *Britain* was given to the island by foreigners, who could not borrow it from the British tongue, with which they were in all likelihood unacquainted. That the island received the name of *Britain* from foreigners is evident, since the natives never styled themselves *Britons*, nor their country *Britain*; their true name being *Cornii*, or *Cumbri*; whence *Cambria* the name of Wales to this day among the Welsh.

The learned Bochart, speaking of the colonies and language of the Phœnicians, offers a conjecture which most of our modern writers have adopted as the most natural. The Phœnicians, according to that writer, called this island and some others near it, *Barat Anas*, that is, *the land or country of tin or lead*, and more contractedly *Beatania*; which name, passing from the Phœnicians to the Greeks, and from these to the Romans, might have been softened into that of *Britannica* and *Britannia*. That the Phœnicians first discovered these islands, which were afterwards by the Greeks called *Cassiterides*, and are proved by Camden to be our Scilly islands, appears both from Strabo and Pliny; of whom the former tells us, that the Phœnicians first brought tin from the Cassiterides, which they sold to the Greeks; but kept the trade to themselves, and the place private; and the latter writes, that Mediocritus was the first who brought lead from the Cassiterides; where Bochart shows that we ought to read *Alexibantus*, who is the Phœnician Hercules of Sanchoniatho, to whom that nation ascribe their first western discoveries. But notwithstanding the care of the Phœnicians to conceal these islands, the Greeks at last discovered them; and gave them the name of *Cassiterides*, which, in the Greek tongue, signifies the same with *Barat Anas* in the Phœnician. This name was at first given to the islands of Scilly already mentioned, but by degrees communicated to all the others lying in the same sea. Thus Bochart. But after all, his opinion, however plausible in appearance, may be as foreign to the purpose as any of the rest; many instances of names given to new-discovered countries showing that the origin of such names is not always owing to reason, but often to chance or caprice.

The general division of Britain is into ENGLAND, SCOTLAND, and WALES; for a particular description and history of which, see these articles.

In the year 1063, the kingdoms of Scotland and England fell under the dominion of one sovereign; by the accession of James VI. of Scotland to the throne of England. He derived his title to the latter from being the grandson of Margaret eldest daughter to Henry VII. of that kingdom; and, on the failure of all the male line, his hereditary right remained incontestable. Queen Elizabeth, with her last breath, had recognized him for her successor; so that few sovereigns ever ascended a throne with more approbation

of their subjects, or greater hopes of a peaceable and happy reign.

Those hopes, however, were soon blasted; and the history of this monarch's reign consists of little else than a detail of disputes and contentions between him and his parliament. A particular and minute account of such transactions could afford very little entertainment; but it is of importance to know their origin, as they are to be reckoned the ultimate causes of those succeeding events which make so conspicuous a figure in the annals of Britain.

In those barbarous ages which preceded the period we are now entering upon, the human mind, enervated by superstition, and obscured by ignorance of every art and science, seemed to have given up all pretensions to Liberty, either religious or civil. Unlimited and uncontrouled despotism prevailed every where; and though England suffered less in this respect than almost any other nation, the many examples of arbitrary power exerted by her sovereigns, queen Elizabeth herself, James's immediate predecessor, not excepted, show that they were very far from being then a free people. An incontestable proof of this, and an evidence how little restraint at that time the people could lay upon the authority of the sovereign, is, that the proceedings of parliament were accounted, even by themselves, of so little consequence, that they were not at the trouble to keep journals of them. It was not till the year 1607, four years after the accession of James, that parliamentary journals were kept, at the motion of Sir Edwin Sandys, a member of great authority in the house.

The proceedings of the parliament being at that time of so little consequence, it is no wonder that the sessions were not regular, or that little attention was paid to the choice or continuance of the members. In the reign of Elizabeth, and her predecessors, the sessions of parliament did not continue above the twelfth part so long as the vacations. It was then usual, after parliaments had been prolonged beyond one session, for the chancellor to exert a discretionary authority of issuing new writs to supply the place of any members whom he judged incapable of attending, either on account of their employment, sickness, or other impediment. No practice could be more dangerous to liberty than this, as it gave the chancellor, and consequently the sovereign, an opportunity of garbling at pleasure the representatives of the nation: yet so little was liberty at that time understood, that the commons, of their own accord, without the least countenance or intrigue, and contrary to some former votes of their own, confirmed the chancellor's power in this respect in the 23d of Elizabeth. Nor did they proceed any farther in the assertion of their privileges, than to vote, that "during the sitting of parliament there do not, at any time, any writ go out for the choosing or returning any member without the warrant of the house."

Towards the end of the 16th or beginning of the 17th century, a great revolution took place, though insensibly, throughout all Europe. Arts and sciences began to flourish, commerce and navigation were greatly extended, and learning of all kinds began to dilate itself. By more enlarged views, the love of freedom began, in England especially, to take place in the breasts of most people of birth and education; and this was

England.

greatly promoted by an acquaintance with the ancient Greek and Latin historians. From the example of the republics of Greece and Rome, whose members had so often sacrificed their lives for the sake of liberty, a patriotic spirit began to arise; and a desire of circumscribing the excessive prerogative and arbitrary proceedings of the crown began secretly to take place throughout the nation.

8
Grievances
the nation
at that time
laboured
under.

Nor was this desire unreasonable, or without a solid foundation. During the last years of queen Elizabeth's reign, the commerce, navigation, and number of seamen in England, had sensibly decayed. A remonstrance from the Trinity-house in 1602 says, that since 1588, the number of seamen and shipping had decayed about a third part. Every species of domestic industry was fettered by monopolies; and by exclusive companies, which are only another species of monopoly, almost all foreign trade, except that to France, was brought into the hands of a few rapacious engrossers, and all prospect of future improvement in commerce was for ever sacrificed to a little temporary advantage of the sovereign. These companies, though arbitrarily erected, had carried their privileges so far, that almost all the commerce of England centered in London; the customs of that port alone amounted to 110,000*l.* a-year; while those of all the kingdom beside amounted only to 17,000*;* nay, the whole trade of London was confined to about 200 citizens, who were easily enabled, by combining among themselves, to fix whatever price they pleased both on the exports and imports of the nation. Besides this, the subjects were burdened by wardships and purveyances. The latter was an old prerogative of the crown, by which the officers of the household were empowered to take, without consent of the owners, provisions for the king's family, and carts and horses for the removal of his baggage, upon paying a stated price for them. The king had also a power of sending any person, without his consent, on whatever message he pleased; and thus he could easily force any individual to pay him whatever money he chose, rather than be sent out of the country on a disagreeable errand. Money extorted from individuals, by this or any other method, was called a *benevolence*.

These were some of the grievances under which the nation at this time laboured, and these the rising spirit of patriotism tended to redress. This disposition, however, the severe government of Elizabeth had confined within very narrow bounds: but when James succeeded to the throne; a foreign prince, less dreaded and less beloved; symptoms of a more free and independent genius immediately appeared. Happily James neither perceived the alteration, nor had sufficient capacity to check its early advances. He had established in his own mind a speculative system of absolute government, which few of his subjects, and none but traitors and rebels, he thought, would make any scruple to admit. He considered himself as intitled to equal prerogatives with other European sovereigns, not considering the military force with which their despotism was supported. The almost unlimited power which, for upwards of a century, had been exercised by the English sovereigns, he considered as due to royal birth and title, not to the prudence and spirit of those monarchs, or the conjunctures of the times. In his person, therefore, he imagined all legal power to be centered by an heredi-

9
James's ar-
bitrary sy-
stem of go-
vernment.

tary and a divine right; nay, so fully was he persuaded that he was the absolute proprietor of his subjects, that in his speech to the parliament in 1621, he told them, that he "wished them to have said that their privileges were derived from the grace and permission of him and his ancestors." And when the same parliament protested that "the liberties, franchises, privileges, and jurisdictions of parliament, are the ancient and undoubted birthright and inheritance of the subjects of England," he was so enraged, that sending for the journals of the commons, he, with his own hand, before the council, tore out this protestation; and ordered his reasons to be inserted in the council book.

Such were the opposite dispositions of the prince and parliament, at the commencement of the Scottish line; dispositions just beginning to exist and to appear in parliament, but thoroughly established, and openly avowed on the part of the king, throughout his whole reign.

The consequence of such opposite dispositions prevailing in the king and parliament was, that during this reign the prerogatives of the crown were violently and openly attacked; but the chief grounds of discontent were money and religion. The king's high notions of the royal prerogative made him imagine he had a right to whatever sums he pleased to demand; and his profusion caused him to dissipate in a short time the scanty supplies he could extort from the parliament, who seem to have behaved as unreasonably on the one hand as James himself did on the other. With regard to religious matters, the nation was at that time greatly infected with puritanism. Though the severities of Elizabeth had almost totally suppressed the Papists, it had been otherwise with the Puritans. So much had they increased by the very means which had diminished the number of catholics, that no less than 750 clergymen of that persuasion signed a petition to James on his accession. They hoped that the king, having received his education in Scotland, and having always professed an attachment to the church established there, would at least abate the rigour of the laws enacted against the Puritans, if he did not show them particular favour and encouragement. But in this they were mistaken. He had observed in their Scots brethren a violent turn toward republicanism, and a zealous attachment to civil liberty. In the capacities both of monarch and theologian, he had experienced the little complaisance they were disposed to show him. They controuled his commands; disputed his tenets; and to his face, before the whole people, censured his conduct and behaviour. This superiority assumed by the presbyterian clergy, the monarchic pride of James could never digest. Though he had been obliged while in Scotland to court their favour, he treasured up on that account the stronger resentment against them; and was determined to make them feel in their turn the weight of his authority. He therefore not only rejected the petition of the 750 clergymen above mentioned, but throughout his whole reign refused to relax in the least the severity of the laws against Protestant nonconformists, though very often petitioned in their favour by his parliament.

The same principles which occasioned in James such an aversion to the Puritans, prompted him greatly to favour the episcopals, and even the Papists, as being greater

Britain. greater friends to despotism. In his youth he had been suspected of a bias towards the religion of the latter; and when he ascended the throne of England, it is certain he often endeavoured to procure some mitigation of the laws against them, if not an absolute toleration. But in this he was constantly opposed by the parliament; and indeed the strong inclination shown by James to establish episcopacy throughout every corner of his dominions, tended very much to alienate the minds of the generality of his subjects, especially in Scotland, entirely from him.

13 Attempts to establish episcopacy in Scotland. In May 1617, the king set out for Scotland, expressly with the design of establishing episcopacy in that kingdom. He did not, however, propose to abolish presbytery entirely, and set up absolute episcopacy in its room. He designed to content himself with establishing the royal authority above the ecclesiastical, and introducing some ceremonies into the public worship, such as kneeling at the sacrament, private communion, private baptism, confirmation of children, and the observance of Christmas, &c. But as his design was fully seen from the beginning, every advance towards episcopacy gave the greatest discontent, and those trivial ceremonies were rejected as so many mortal sins.

14 Tyranny of the Scots clergy. At this time the power of the Scots clergy was exceedingly great; and the gloomy enthusiastic spirit with which they were actuated, prompted them to exercise it in such a manner as to make their tyranny insupportable to those who were of a different way of thinking from themselves. Every ecclesiastical court possessed the power of excommunication; which was then attended with some very serious temporal consequences, besides the spiritual ones which were supposed to flow from it. The person excommunicated was thinned by every one as profane and impious: his whole estate during his life-time, and all his moveables for ever, were forfeited to the crown. A sentence of excommunication was sometimes pronounced in a summary manner, by any ecclesiastical court however inferior, against any person, whether he lived within the bounds of their jurisdiction or not. And by this means, the whole tyranny of the inquisition, though without its orders, was introduced into Scotland. But the clergymen were not satisfied with this unbounded authority in ecclesiastical matters; they assumed a censorial power over every part of administration; and in all their sermons and even prayers mingling politics with religion, they inculcated the most seditious and turbulent principles. One black, a minister of St Andrew's, went so far as to pronounce in one of his sermons, that all kings were the devil's children; and in his prayer for the queen he used these words, "We must pray for her for the fashion's sake, but we have no cause: she will never do us any good." Another minister preaching in the principal church of that capital, said, that the king was possessed with a devil; and that, one devil being expelled, seven worse had entered in his place. To which he added, that the subjects might lawfully rise, and take the sword out of the hands of their sovereign.

16 The king's design to invade Scotland. We can scarce wonder that James should be desirous of subjugating such rebellious and turbulent spirits as these; and, on the other hand, considering the extreme weakness of this monarch's understanding, and that he imagined himself able to manage not only su-

rious religionists, but even the most powerful foreign nations, with no other weapon than mere argumentation, we can as little wonder at his want of success.— In short, so far was James from being able to establish his royal authority above the ecclesiastical, that he found himself unable to introduce a single ceremony. He returned therefore with the mortification not only of seeing his schemes entirely baffled with regard to Scotland, but of having disgusted even the few of that nation over whom religious prejudices did not prevail: for they, considering the ceremonies so much insisted on by the king as trivial and insignificant, could not help thinking the national honour sacrificed by a servile imitation of the modes of worship practised in England, and that their sovereign betrayed equal narrowness of mind, though in an opposite manner, with those he so much condemned.

17 His bad success against the puritans in England. The like bad success attended James when he attempted some opposition to the puritanical innovations in England. He had observed in his progress through that kingdom, that a Judaical observance of the Sunday gained ground every day: and that by this means, under colour of religion, the people were debarred from such sports and recreations as contributed to their health as well as amusement. Imagining, therefore, that it would be easy to infuse cheerfulness into the dark spirit of devotion which then prevailed, he issued a proclamation to allow and encourage, after divine service, all kinds of lawful games and exercises; and this proclamation his subjects regarded as an instance of the utmost profaneness and impiety. In 1620 a bill was brought in by the commons for the more strict observance of the Sunday, which they affected to call the *sabbath*. One Shepherd opposed this bill, objected to the appellation of *sabbath* as puritanical, and seems even to have justified sports on that day. For this he was expelled the house by the suggestion of Mr Pym; and in the sentence pronounced against Shepherd, his offence is said to be *great, exorbitant, and unparalleled*.

This sketch, we hope, will be sufficient to give the reader a tolerable idea of the situation of affairs during the reign of James I. We now proceed to give an account of the few remarkable transactions which occurred in this period.

18 The first thing of any consequence was a conspiracy formed, the very year of the king's accession to the throne, to displace him, and bestow the kingdom on Arabella Stuart, a near relation of James's, and equally descended from Henry VII. With regard to this conspiracy every thing remains still mysterious, as it was at the time when the conspiracy itself was discovered. What renders it remarkable is the concern Sir Walter Raleigh was said to have in it; for which he was tried, condemned without sufficient proof, suffered 13 years imprisonment in the tower, and was afterwards executed out of complaisance to the Spaniards. See RALEIGH.

19 Account of the gunpowder treason. In 1605 was discovered the famous *gunpowder treason*, the anniversary of which discovery hath ever afterwards been celebrated with rejoicings. Its origin is as follows: On the accession of James, great expectations had been formed by the catholics that he would prove favourable to them, both as that was the religion of his mother, and as he himself had been

Britain.

Britain.

suspected of a bias towards it in his youth. It is even pretended that he had entered into positive engagements to grant them a toleration as soon as he should mount the throne of England. Here, however, they found their hopes built on a false foundation. James on all occasions expressed his intention of executing strictly the laws enacted against them, and of persevering in all the rigorous measures of Queen Elizabeth. A plan of revenge was first thought of by one Catesby, a gentleman of good parts, and of an ancient family. He communicated his mind to Percy, a descendant of the house of Northumberland. The latter proposed to assassinate the king; but this seemed to Catesby very far from being adequate to their purpose. He told Percy, that the king would be succeeded by his children, who would also inherit his maxims of government. He told him, that even though the whole royal family were destroyed, the parliament, nobility, and gentry, who were all infected with the same heresy, would raise another Protestant prince to the throne. "To serve any good purpose (says he), we must destroy, at one blow, the king, the royal family, the lords and commons; and bury all our enemies in one common ruin. Happily they are all assembled on the first meeting of parliament; and afford us the opportunity of glorious and useful vengeance. Great preparations will not be requisite. A few of us may run a mine below the hall, in which they meet; and choosing the very moment when the king harangues both the houses, consign over to destruction those determined foes to all piety and religion. Mean while, we ourselves standing aloof, safe and unsuspected, shall triumph in being the instruments of divine wrath, and shall behold with pleasure those sacrilegious walls, in which were piled the edicts for proscribing our church and butchering her children, tossed into a thousand fragments; while their impious inhabitants, meditating perhaps still new persecutions against us, pass from flames above to flames below, there for ever to endure the torments due to their offences."

20
Catesby's
speech.

21
Preparations for the
execution of
the plot.

This terrible scheme being approved of, it was resolved to communicate it to a few more. One Thomas Winter was sent over to Flanders in quest of Rawkes, an officer in the Spanish service of approved zeal and courage. All the conspirators were bound by the most solemn oaths, accompanied with the sacrament; and to such a degree had superstition effaced every principle of humanity from their minds, that not one of them ever entertained the smallest compunction for the cruel massacre they were going to commit. Some indeed were startled at the thoughts of destroying a number of catholics who must necessarily be present as spectators, or attendants on the king, or as having seats in the house of peers. But Tesmond a jesuit, and Garnet superior of that order in England, removed those scruples, by showing that the interest of religion required in this case the sacrifice of the innocent with the guilty.

This happened in the spring and summer of 1604; when the conspirators also hired a house in Percy's name, adjoining to that in which the parliament was to assemble. Towards the end of that year they began to pierce through the wall of the house, in order to get in below that where the parliament was to sit. The wall was three yards thick, and consequently occasioned a great deal of labour. At length, however, they ap-

proached the other side, but were then startled by a noise for which they could not well account. Upon inquiry, they found that it came from a vault below the house of lords; that a magazine of coals had been kept there; and that the coals were then selling off, after which the vault would be let to the highest bidder. Upon this the vault was immediately hired by Percy; 36 barrels of powder lodged in it; the whole covered up with faggots and billets; the doors of the cellar boldly flung open; and every body admitted, as if it contained nothing dangerous.

Being now, as they thought, assured of success, the conspirators began to plan the remaining part of their enterprize. The king, the queen, and prince Henry, were expected to be present at the opening of the parliament. The duke, by reason of his tender age, would be absent, and it was resolved that Percy should seize or murder him. The princess Elizabeth, likewise a child, was kept at Lord Harrington's house in Warwickshire; and some others of the conspirators engaged to assemble their friends on pretence of a hunting match, when they were to seize that princess, and immediately proclaim her queen. The day so long wished for at last approached; the dreadful secret, tho' communicated to more than 20 persons, had been religiously kept for near a year and an half; and nothing could be foreseen which could possibly prevent the success of their design. Ten days before the meeting of parliament, however, lord Monteagle, a catholic son to lord Moleley, received the following letter, which had been delivered to his servant by an unknown hand. "My lord, out of the love I bear to some of your friends, I have a care for your preservation. Therefore I would advise you, as you tender your life, to devise some excuse to shift off your attendance on this parliament. For God and man have determined to punish the wickedness of this time. And think not slightly of this advertisement; but retire yourself into the country, where you may expect the event in safety. For, tho' there be no appearance of any stir, yet, I say, they shall receive a terrible blow this parliament; and yet they shall not see who hurts them. This counsel is not to be contemned, because it may do you good, and can do you no harm: for the danger is ever as soon as you have burned this letter. And I hope God will give you the grace to make good use of it, to whose holy protection I commend you."—Though Monteagle imagined this letter to be only a ridiculous artifice to frighten him, he immediately carried it to lord Salisbury, secretary of state; who laid it before the king on his arrival in town a few days after.

22
Conspiracy
discovered.

The king looked upon the letter in a more serious light. From the manner in which it was wrote he concluded that some design was forming to blow up the parliament-house with gunpowder, and it was thought advisable to search the vaults below. The lord chamberlain, to whom this charge belonged, purposely delayed the search till the day before the meeting of parliament. He remarked those great piles of wood and faggots which lay in the vault under the upper-house; and casting his eye upon Rawkes, who stood in a corner and passed himself for Percy's servant, he took notice of that daring and determined courage which was conspicuous in his face, and so much distinguished this conspirator even amongst the

the.

the other heroes in villany that were concerned in the scheme. Such a quantity of fuel, also, for one who lived so little in the town as Percy, appeared somewhat extraordinary; and, upon comparing all circumstances, it was resolved to make a further search. About midnight, Sir Thomas Knevet, a justice of peace, was sent with proper attendants; and before the door of the vault, finding Fawkes, who had just finished all his preparations, he immediately seized him, and, turning over the faggots, discovered the powder. The matches and every thing proper for setting fire to the train were taken in Fawkes's pocket; who seeing now no refuge but in boldness and despair, expressed the utmost regret that he had lost the opportunity of firing the powder at once, and of sweetening his own death by that of his enemies. For two or three days he displayed the same obstinate intrepidity; but, being confined in the tower, and the rack just shown to him, his courage at last failed, and he made a full discovery of all the conspirators.

Catesby, Percy, and the other criminals, on hearing that Fawkes was arrested, hurried away to Warwickshire; where Sir Edward Digby, imagining that his confederates had succeeded, was already in arms, to seize the princess Elizabeth. She had escaped into Coventry; and they were obliged to put themselves in a posture of defence against the country-people, who were raised from all quarters and armed by the sheriffs. The conspirators, with all their attendants, never exceeded the number of 80 persons; and being surrounded on every side, could no longer have any hope either of prevailing or escaping. Having therefore confessed themselves, and received absolution, they boldly prepared for death, and resolved to sell their lives as dear as possible. But even this miserable consolation was denied them. Some of their powder took fire, and disabled them from defending themselves. The people then rushed in upon them. Percy and Catesby were killed with one shot. Digby, Rookwood, Winter, and others, being taken prisoners, were tried, confessed their guilt, and died as well as Garnet, by the hands of the common executioner. The lords Stourton and Mordaunt, two catholics, were fined, the former of 4000 *l.* the latter of 10,000 *l.* by the star-chamber; because their absence from parliament had occasioned a suspicion of their being made acquainted with the conspiracy. The earl of Northumberland was fined 30,000 *l.* and detained several years a prisoner in the tower; because, not to mention other grounds of suspicion, he had admitted Percy into the number of gentlemen pensioners, without his taking the requisite oaths.

In 1612, James appears in his most advantageous point of view, namely, as legislator of Ireland, and the person who undertook to civilize the barbarous inhabitants of that kingdom, and to render their subjection durable and useful to the crown of England. In this work, James proceeded by a steady, regular, and well-concerted plan. He began with abolishing the ancient Irish customs which supplied the place of laws, and which were exceedingly barbarous and absurd. By the Brehon law, every crime however enormous was punished not with death, but by a fine. Murder itself was compensated in this way. Every one had a value affixed to him, called his *eric*; and whoever was able

to pay this, might kill him when he pleased. As for such slight offences as oppression, extortion, or other things of that nature, no penalty was affixed to them, nor could any redress for them ever be obtained. By the custom of *gavelkind*, upon the death of any person, his land was divided among all the males of the sept or family, both bastard and legitimate; and after partition made, if any of the sept died, his portion was not shared out among his sons; but the chieftain of his district made a new partition of all the lands belonging to that sept, and gave every one his share; as no man, by reason of this custom, enjoyed the fixed property of any land; to build, cultivate, or improve, must have been to much lost labour. Their chieftains were established by election, or, more properly speaking, by force and violence. Their authority was absolute; and, notwithstanding certain lands were assigned to the office, its chief profit resulted from exactions, dues, assessments, for which there was no fixed law, and which were levied at pleasure.

After abolishing these customs, and substituting English law in their place; James having taken all the natives under his protection, and declared them free citizens, proceeded to govern them by a regular administration, military as well as civil. A sufficient army was maintained, its discipline inspected, and its pay transmitted from England, in order to prevent the soldiery from preying upon the country, as had been usual in former reigns. When Ologhartie raised an insurrection, a reinforcement was sent over, and the rebellion immediately extinguished. All minds being first quieted by an universal indemnity, circuits were established, justice administered, and crimes of every kind severely punished. As the Irish had been universally engaged in a rebellion against Elizabeth, a resignation of all the rights formerly granted them to separate jurisdictions was rigorously exacted; a resignation of private estates was even required; and when they were restored, the proprietors received them under such conditions as might prevent all future tyranny and oppression over the common people. The whole province of Ulster having fallen to the crown by the attainder of rebels, a company was established in London for planting new colonies in that fertile country. The property was divided into moderate shares, the largest not exceeding 2000 acres: Tenants were brought over from England and Scotland: The Irish were removed from the hills and fastnesses, and settled in the open country: Husbandry and the arts were taught them; and by these means Ulster, from being the most wild and disorderly province in Ireland, soon became the best cultivated and most civilized.

This year was also remarkable for the death of Henry prince of Wales, who died suddenly on the 6th of November, not without strong suspicions of poison, in which the king himself was blamed. On opening his body, however, no symptoms of poison appeared; but his death diffused an universal grief throughout the nation, he being reckoned a prince of extraordinary accomplishments.

The marriage of the princess Elizabeth with Frederick elector palatine, which was celebrated February 14th 1613, served to dissipate the grief which had arisen on account of prince Henry's death. But this marriage, in the event, proved unhappy to the king as well as

Britain. as his son-in-law. The elector, trusting to so great an alliance, engaged in enterprizes beyond his strength; and James, not being able, and indeed perhaps not willing, to assist him in his distress, lost entirely what remained of the affections of his people.

28 The elector These bad consequences did not begin to appear till the year 1619. At that time the states of Bohemia having taken arms against the emperor Matthias, in defence of the Protestant religion, and continued their revolt against his successor Ferdinand II. and being alarmed at his mighty preparations against them, made an offer of their crown to the elector palatine. To this they were induced by the greatness of his connections, as being son-in-law to the king of England, and nephew to prince Maurice, whose authority in the United Provinces was almost absolute; and the young palatine stimulated by ambition, without consulting either James or Maurice, whose opposition he foresaw, immediately accepted the offer, and marched all his forces into Bohemia, in support of his new subjects.

29 Defeated and driven out of his dominions.

The affairs of the new king were not long of coming to an unfortunate crisis. It was known almost at one time in England, that Frederic being defeated in the great and decisive battle of Prague, had fled with his family into Holland; and that Spinola the Spanish general had invaded the palatinate, where meeting with little resistance, except from one body of 2400 Englishmen commanded by the brave Sir Horace Vere, had in a little time reduced almost the whole principality. In 1621, the ban of the empire was published against the unfortunate elector, and the execution of it was committed to the duke of Bavaria. The upper palatinate was in a little time conquered by that prince; and measures were taken in the empire for bestowing on him the electoral dignity of which the palatine was despoiled. Frederic was now obliged to live with his numerous family, in poverty and distress, either in Holland, or at Sedan, with his uncle the duke of Bouillon; and the new conquests of the catholics throughout all Germany were attended with persecutions against the Protestants.

30 English insisted for a war with the house of Austria.

At this news the religious zeal of the English was inflamed to the highest degree; and they would have plunged headlong into a war with the house of Austria, without reflecting in the least on the consequences that might ensue. The sufferings of their Protestant brethren in Germany were the only objects of consideration, and the neutrality and inactive spirit shown by James were loudly exclaimed against. But though James might have defended his pacific measures by very plausible arguments, it is certain that some of his motives were the most ridiculous that can be imagined. Such was the opinion that he himself entertained of his own wisdom, that he imagined himself capable of disarming hostile nations by dint of argument; and that the whole power of Austria, though not awed by the power of England, would submit to his arbitration, merely out of respect to his virtue and moderation.—So much also he was wedded to his opinion concerning the prerogative of kings, that he imagined, wherever there was a contention between any sovereign and his subjects, the latter behaved always to be in the wrong; and for this reason, from the very first he had lent his son-in-law the title of *king of Bohemia*, and forbid

him to be prayed for in the churches under that appellation. Besides these reasons, James was on another account extremely averse to come to a rupture with Spain. He had entertained an opinion peculiar to himself, which was, that any alliance below that of a king was unworthy a prince of Wales; and he never would allow any prince but a daughter of France or Spain to be mentioned as a match for his son. This piece of pride, which really implied meanness as if he could have received honour from any alliance, gave Spain an opportunity of managing this monarch in his most important concerns. With a view to engage him to a neutrality with regard to the succession of Cleves, the eldest daughter of the king of Spain had been indirectly offered during the life of prince Henry. The bait, however, did not then take; James, in consequence of his alliance with the Dutch, marched 4000 men to the assistance of the Protestants, by which means the succession was secured to the Protestant line. In 1618, Gondomar the Spanish ambassador made offer of the king's second daughter to prince Charles; and, that he might render the temptation irresistible to the necessitous James, gave hopes of an immense fortune that should attend the prince's. Upon this match James had built great hopes, not only of relieving his own necessities, but of recovering the palatinate for his son-in-law; which last, he imagined, might be procured from the mere motive of friendship and personal attachment.

This last step was equally disagreeable to the commons with the rest; and, joined to the other pieces of James's conduct, at last blew into a flame the contention which had so long subsisted between their sovereign and them. On the 14th of November 1621, the commons framed a remonstrance which they intended to carry to the king. They represented, that the enormous growth of the Austrian power threatened the liberties of Europe; that the progress of the Catholic religion in England bred the most melancholy apprehensions lest it should again acquire an ascendant in the kingdom; that the indulgence of his majesty towards the professors of that religion had encouraged their insolence and temerity; that the uncontrolled conquests made by the Austrian family in Germany raised mighty expectations in the English Papists; but above all, that the Spanish match elevated them so far as to hope for an entire toleration, if not a final re-establishment, of their religion. They therefore intreated his majesty, that he would immediately undertake the defence of the palatine, and maintain it by force of arms; that he would turn his sword against Spain, whose armies and treasures were the chief support of the Catholic interest in Europe; that he would enter into no negotiation for the marriage of his son but with a Protestant prince; that the children of Popish recusants should be taken from their parents, and committed to the care of Protestant teachers and schoolmasters; and that the fines and confiscations to which the Catholics by law were liable, should be levied with the utmost severity.

The king, who was then at Newmarket, hearing of the intended remonstrance, wrote a letter to the speaker in which he sharply rebuked the house for debating on matters far above their reach and capacity; and he strictly forbid them to meddle with any thing that regarded

Britain. ³² He is desirous of a Spanish match for his son.

gaided his government, or deep matters of state, and especially not to touch on his son's marriage with the Spanish princess. Upon this the commons framed a new remonstrance, in which they asserted their right of debating on all matters of government, and that they possessed entire freedom of speech in their debates. The king replied, that their remonstrance was more like a denunciation of war, than an address of dutiful subjects; that their pretension to inquire into all state affairs without exception, was such a plenipotence as none of their ancestors, even during the reign of the weakest princes, had ever pretended to; that public transactions depended on a complication of views and intelligence, with which they were entirely unacquainted; that they could not better show their wisdom, as well as duty, than by keeping within their proper sphere; and that in any business which depended on his prerogative, they had no title to interpose with their advice, unless when he pleased to ask it, &c. The commons in return framed the protestation already mentioned, which the king tore out of their journals, and soon after dissolved the parliament. The leading members of the house, Sir Edward Coke and Sir Robert Phillips, were committed to the tower: three others, Selden, Pym, and Mallory, to other prisons; and, as a lighter punishment, some others were sent into Ireland to execute the king's business. Sir John Saville, however, a powerful man in the house of commons, and a zealous opposer of the court, was made comptroller of the household, a privy councillor, and soon after a baron. This event is memorable; as being the first instance in the English history, of any king's advancing a man on account of parliamentary interest, and of opposition to his measures.

36
Origin of the factions of whig and tory.

This breach between the king and parliament soon made politics become a general subject of discourse, and every man began to indulge himself in reasonings and inquiries concerning matters of state; and the factions which commenced in parliament were propagated throughout the nation. In vain did James, by reiterated proclamations, forbid discourses of this kind. Such proclamations, if they had any effect, served rather to inflame the curiosity of the public. In every company or society the late transactions became the subject of argument and debate; some taking the side of monarchy, others of liberty; and this was the origin of the two parties since known by the names of *Whig* and *Tory*.

37
James gains the favour of the court of Spain.

For five years, James continued the dupe of the court of Spain. Though firmly resolved to contract no alliance with a heretic, the king of Spain had continued to procrastinate and invent one excuse after another, while he pretended to be very willing to conclude the match. At last the king of England, finding out what was really the matter, resolved to remove that obstacle if possible. He issued public orders for discharging all Popish recusants who were imprisoned; and it was daily apprehended that he would forbid, for the future, the execution of the penal laws against them. For this conduct he was obliged to apologize, and even pretend that it was done in order to procure from foreign princes a toleration for the Protestants; the severity of the English laws against catholics, he said, having been urged as a reason against showing any favour to Protestants residing in catholic kingdoms.

These concessions in favour of the catholics, however ill relished by his subjects, at last obtained James's end with regard to the marriage. The earl of Bristol, ambassador at the court of Spain, a minister of vigilance and penetration, and who had formerly opposed the alliance with catholics, being now fully convinced of the Spanish sincerity, was ready to congratulate the king on the completion of his projects. The Spanish princess is represented as very accomplished; she was to bring with her a fortune of L. 600,000; and, what was more, not only Bristol considered this match as an infallible prognostic of the palatine's restoration, but the Spaniards themselves did the same. All things being therefore agreed upon between the parties, nothing was wanting but the dispensation from Rome, which might be considered as a matter of mere formality. The king exulted in his pacific counsels, and boasted of his superior sagacity and penetration; when all his flattering prospects were blated by the temerity of the duke of Buckingham, who governed both court and nation with almost unlimited sway.

38
Marriage with the infanta agreed upon.

This nobleman had suddenly been raised to the highest honours. Though possessed of some accomplishments of a courtier, he was utterly devoid of every talent of a minister; but at once partook of the insolence which attends a fortune newly acquired, and the impetuosity which belongs to persons born in high stations, and unacquainted with opposition. Among those who had experienced the arrogance of this overgrown favourite, the prince of Wales himself had not been entirely spared; and a great coldness, if not enmity, had for that reason taken place between them. Buckingham being desirous of putting an end to this coldness, and at the same time envious of the great reputation of the earl of Bristol, persuaded the prince to undertake a journey to Madrid; which, he said, would be an unexpected galantry; would equal all the fictions of Spanish romance; and, sailing the amorous and enterprising character of that nation, must immediately introduce him to the princess under the agreeable character of a devoted lover and daring adventurer. Little persuasion was necessary to prevail with prince Charles to undertake this journey; and the impetuosity of Buckingham having extorted a consent from James, our two adventurers set out, prince Charles as the knight-errant, and Buckingham as the squire. They travelled through France in disguise, assuming the names of Jack and Tom Smith. They went to a ball at Paris, where the Prince first saw the princess Henrietta whom he afterwards married, who was then in the bloom of youth and beauty, and with whom the novelists of that time say he then fell in love. On their arrival at Madrid, every body was surprised by a step so little usual among great princes. The Spanish monarch made Charles a visit, expressed the utmost gratitude for the confidence he reposed in him, and made warm protestations of a correspondent confidence and friendship. He gave him a golden key which opened all his apartments, that the prince might, without any introduction, have access to him at all hours: he took the left hand of him on every occasion, except in the apartments assigned to Charles; for there, he said, the prince was at home: Charles was introduced into the palace with the same pomp and ceremony which attend the kings of Spain on their coronation: the court issued public orders to obey him as the

39

40
Their knighting reception at Madrid.

king himself: Olivarez too, the prime minister, though a grandee of Spain, who has the right of being covered before his own king, would not put on his hat in the prince's presence: all the prisons of Spain were thrown open, and all the prisoners received their freedom, as if an event the most honourable and most fortunate had happened to the monarchy; and every sumptuary law with regard to apparel was suspended during prince Charles's residence in Spain. The infanta, however, was only shown to her lover in public; the Spanish ideas of decency being so strict, as not to allow any farther intercourse till the arrival of the dispensation. The point of honour was carried so far by these generous people, that no attempt was made, on account of the advantage they had acquired by having the prince of Wales in their power, to impose any harder conditions of treaty: their pious zeal only prompted them on one occasion to desire more concessions in the religious articles; but, on the opposition of Bristol, they immediately desisted. The Pope, however, hearing of Charles's arrival in Madrid, tacked some new clauses to the dispensation; and it became necessary to transmit the articles to London, that the king might ratify them.

⁴¹ Articles of the marriage-treaty. This treaty, which was made public, consisted of several articles, chiefly regarding the exercise of the catholic religion by the infanta; and, among these, nothing could reasonably be found fault with, except one article, in which the king promised that the children should be educated by the prince's till they were ten years of age; which undoubtedly was insisted upon with a view of seasoning their minds with catholic principles. But, besides this public treaty, there were some private articles sworn to by James, which could not have been made public without grievous murmurs. A suspension of the penal laws against the English catholics was promised, as likewise a repeal of them in parliament, and a toleration for the exercise of that religion in private houses. Meanwhile Gregory XV. who granted the dispensation, died; and Urban VIII. was chosen in his place. Upon this event, the nuncio refused to deliver the dispensation till it should be renewed by Urban. This the crafty pontiff delayed, in hopes that, during the prince's residence in Spain, some expedient might be fallen upon to effect his conversion. The king of England, as well as the prince, became impatient: but, on the first hint, Charles obtained leave to return; and Philip graced his departure with all the circumstances of civility and respect which had attended his arrival. He even erected a pillar on the spot where they took leave of each other, as a monument of mutual friendship; and the prince, having sworn to the observance of all the articles, embarked on board the English fleet at St Andero.

The modest, reserved, and decent behaviour of Charles, together with his unparalleled confidence in them, and the romantic gallantry he had practised with regard to their prince's, had endeared him to the whole court of Madrid. But in the same proportion that Charles was beloved and esteemed, was Buckingham despised and hated. His sallies of passion; his indecent freedoms with the prince; his dissolute pleasures; his arrogant impetuous temper, which he neither could nor would disguise; were to the Spaniards the objects of peculiar aversion. They lamented the infanta's fate, who must

be approached by a man whose temerity seemed to respect no laws divine or human. Buckingham, on the other hand, sensible how odious he was become to the Spaniards, and dreading the influence which that nation would naturally acquire after the arrival of the infanta, resolved to employ all his credit in order to prevent the marriage. By what arguments he could prevail on the prince to offer such an insult to the Spanish nation, from whom he had received such generous treatment; by what colesms he could disguise the ingratitude and imprudence of such a measure; these are totally unknown to us: certain it is, however, that when the prince left Madrid, he was firmly determined, in opposition to his most solemn promises, to break off the treaty with Spain. On their arrival at London, therefore, the prince and Buckingham assumed the entire direction of the negotiation; and it was their business to seek for pretences by which they could give a colour to their intended breach of treaty. At last, after many fruitless artifices were employed to delay or prevent the espousals, Bristol received positive orders not to deliver the proxy which had been left in his hands, or to finish the marriage, till security was given for the full restitution of the palatinate. Philip understood this language: but being determined to throw the whole blame of the rupture on the English, he delivered into Bristol's hand a written promise, by which he bound himself to procure the ratification of the palatinate either by persuasion or by every other possible means; and when he found that this concession gave no satisfaction, he ordered the infanta to lay aside the title of *Princess of Wales*, which she bore after the arrival of the dispensation from Rome, and to drop the study of the English language; and as he knew that such rash counsels as now governed the court of England would not stop at the breach of the marriage-treaty, he immediately ordered preparations for war to be made throughout all his dominions.

A match for prince Charles was soon after negotiated with Henrietta, daughter of the great Henry IV. and this met with much better success than the former. However, the king had not the same allurements in prosecuting this match as the former, the portion promised him being much smaller; but, willing that his son should not be altogether disappointed of a bride, as the king of France demanded only the same terms that had been offered to the court of Spain, James thought proper to comply. In an article of this treaty of marriage, it was stipulated, that the education of the children till the age of 13 should belong to the mother; and this probably gave that turn towards popery which has since proved the ruin of the unfortunate family of Stuart.

James now, being deprived of every other hope of relieving his son-in-law but by force of arms, declared war against Spain and the emperor, for the recovery of the palatinate; 6000 men were sent over into Holland to assist prince Maurice in his schemes against those powers; the people were every where elated at the courage of their king, and were satisfied with any war which was to exterminate the Papists. This army was followed by another consisting of 12,000 men, commanded by count Mansfeldt; and the court of France promised its assistance. But the English were disappointed in all their views: the troops being embarked

Britain. at Dover, upon sailing to Calais, found no orders for their admission. After waiting for some time, they were obliged to sail towards Zealand, where no proper measures were yet concerted for their disembarkation. Mean while, a pestilential disorder crept in among them, so long cooped up in narrow vessels: half the army died while on board; and the other half, weakened by sickness, appeared too small a body to march into the palatinate; and thus ended this ill-concerted and fruitless expedition. Whether this misfortune had any effect on the king's constitution or not, is uncertain; but he was soon after seized with a tertian ague, which put an end to his life on the 27th of March 1625, after having lived 59 years, and reigned over England 22, and over Scotland almost as long as he had lived.

49 succeeded his son Charles I. James was succeeded by his son Charles I. who ascended the throne amidst the highest praises and caresses of his subjects for what was perhaps the most blame-worthy action of his life, namely, his breaking off the match with the Spanish princess, and procuring the rupture with the house of Austria. Being young and unexperienced, he regarded these praises as sincere; and therefore was so impatient to assemble the great council of the nation, that he would gladly, for the sake of dispatch, have called together the same parliament which sat under his father, and which lay at that time under prorogation. But being told that such a measure would appear unusual, he issued writs for summoning a new parliament on the 7th of May; and it was not without regret that the arrival of the princess Henrietta, whom he had espoused by proxy, obliged him to delay, by repeated prorogations, their meeting till the 18th of June, when they assembled at Westminster for the dispatch of business.

51 Charles inherited from his father great dislikes for money, very high notions of the royal prerogative, and a violent attachment to episcopacy. As to his character, he seems to have been obstinate, though not resolute; and therefore, though it was scarce ever possible to make him give up his point, he never could carry on his designs with that spirit which was necessary for their success. In other respects, he appears to have possessed every virtue requisite to constitute the character of a good man. At present believing his subjects to be in perfect friendship with him as he was with them, he resolved that their bounty to him should be entirely unaffected, and the genuine effect of mutual confidence and regard. Accordingly, his discourse to the parliament was full of simplicity and cordiality; he lightly mentioned the occasion he had for supply. He employed no intrigue to influence the suffrages of the members. He would not even allow the officers of the crown, who had seats in the house, to mention any particular sum which he had occasion for; but trusted entirely to the wisdom and affection of his parliament, who perfectly well knew his circumstances.

53 It is almost impossible to read without indignation an account of the return made by the commons to this generous behaviour of their sovereign. They knew that all the money granted by the last parliament had been expended on military and naval preparations; and that great anticipations were likewise made on the revenues of the crown. They were not ignorant that Charles was loaded with a debt contracted by his father, who had borrowed money both from foreign

princes, and from his own subjects. They had learned by experience, that the public revenues would with difficulty maintain the dignity of the crown, even under the ordinary charges of government. They were sensible that the present war was very likely to exceed the rest of their own importunate applications and expectations; and that they had solemnly engaged to support the freedom of the navigation of it. They were dissatisfied with the delay of military enterprises, and that the whole house of Austria against the king of Spain, possessed of the greatest riches and the extensive dominions of any prince in Europe, against the emperor Ferdinand, like to the most potent monarch of the age, who had subdued and attended Germany by the rapidity of his victories. Desirous as they saw that to be made by the British sword, and a vigorous offensive war be waged against these mighty potentates, ere they would resign the palatinate which they had now fully subdued, and which they held in secure possession by its being surrounded with all their other territories. To answer, therefore, all these great and important ends; to satisfy their young king in the first request he made them; to prevent the loss of the many royal virtues, particularly economy, with which Charles was endued; the commons thought proper to confer on the king a supply of £,000,000. To search for the reasons of such an extravagant piece of conduct would be needless; it is impossible they could be good.

It is not to be supposed that Charles, or any person of common sense, could be insensible of such treatment as this; he behaved, however, with great moderation. He represented in the most explicit manner the necessity there was for a large supply; he even condescended to use intreaties; he said that this request was the first he had ever made them; that he was young, and in the commencement of his reign; and if he now met with kind and useful usage, it would render him to the use of parliaments, and would for ever prevent an entire harmony between him and his people.—To these reasons and intreaties, the commons remained inexorable; they even refused the addition of two fifteenths to the former supply. Instead of this, they renewed their ridiculous complaints against the growth of popery, which was now their only grievance. They showed their intolerant spirit by demanding strict execution of the penal laws against the catholics; and remonstrated as if still some late pardons granted to priests. They attacked Montague, one of the king's chaplains, on account of a moderate book which he had lately composed, and which, to their great disgust, saved virtuous catholics as well as other Christians from eternal torments. Charles gave them a generous and complaisant answer; but finally resolved to abate somewhat of the rigorous laws against that unfortunate party, which his engagements with France absolutely required. No measure, however, throughout the whole reign of this prince, was more disgusting to his bigoted subject, or by its consequences, more fatal to himself, than this resolution. The Puritans had continued to gain ground during the whole reign of James, and now formed the majority of the house of commons; in consequence of which, petitions were presented to the king for replacing such *Abbe* clergymen as had been silenced for want of conformity to the ceremonies. They

Britain

King's resolution to the Commons

⁵⁵ Britain. also enacted laws for the strict observance of Sunday, which they affected to call the *sabbath*, and which they sanctified with the most melancholy indolence; and it is worthy of notice, that the different appellations of *Sunday* and *sabbath* were at that time known symbols of the different parties.—In consequence of this behaviour in Charles's first parliament, it was dissolved on the 12th of August 1625, and a new one called on February 6th 1626.

⁵⁶ His scheme to raise money. During this interval Charles had been obliged to borrow from his subjects on privy-seals; the advantage of which was but a small compensation for the disgust it occasioned. By means, however, of that supply, and some other expedients, he was enabled to equip his fleet, though with difficulty. It was designed against Spain, but performed nothing worth notice, and its bad success increased the clamours against the court.

⁵⁷ Proceedings of his second Parliament. Charles's second parliament immediately adopted the same views with the former; however, they voted him a supply of three subsidies (L.168,000), and three fifteenths; but the passing this vote into a law was reserved until the end of the session, that in the mean time they might have an opportunity of forcing the king to make what concessions they pleased. This harsh and undutiful conduct was greatly resented by Charles; but he found himself obliged to submit, and wait the event with patience. In the mean time they attacked the duke of Buckingham, who was become generally obnoxious; and he was also impeached by the earl of Bristol, on account of his conduct with regard to the Spanish negotiation. The earl's impeachment, however, was entirely overlooked, and the commons were able to prove nothing otherwise of any consequence against him. The king imagining that Buckingham's greatest crime was the having been so much in favour with his foreign, commanded the house expressly not to meddle with his minister and servant, but to finish in a few days the bill they had begun for the subsidies; otherwise they must expect to sit no longer.

⁵⁸ The commons dissolved. Suggestions of this kind had a bad effect; and when the king proceeded further to throw into prison two members of the house who had managed the impeachment against Buckingham, the commons declared that they would proceed no further in business till they had satisfaction in their privileges. Charles alleged as the reason of this measure, certain seditious expressions, which, he said, had, in their accusation of the duke, dropped from these members. Upon inquiry it appeared that no such expressions had been used, and the members were accordingly released. Soon after, the house of lords, moved by the example of the commons, claimed liberty for the earl of Arundel, who had been lately confined in the tower; and after many fruitless evasions the king was obliged, though somewhat ungracefully, to comply.

The next attack made by the commons would have proved decisive, had it succeeded, and would have reduced the king to an absolute dependence on his parliament. They were preparing a remonstrance against the levying of tonnage and poundage without consent of parliament. This article, together with the new impositions laid on merchandize by James, constituted near one-half of the crown revenues; and after having gained this point, they were to petition the

king, which then would have been the same thing with commanding him, to remove Buckingham from his presence and councils. The king, however, being alarmed at the yoke they were preparing for him, dissolved his parliament a second time, June 15. 1626.

Charles having thus made such a breach with his parliament as there was no hopes of repairing, was obliged to have recourse to the exercise of every branch of his prerogative in order to supply himself with money. A commission was openly granted to compound with the catholics, and agree for dispensing with the penal laws enacted against them; and by this expedient the king, indeed, filled his coffers, but gave universal disgust to his subjects. From the nobility he desired assistance: from the city he required a loan of L. 100,000. The former contributed slowly; but the latter, covering themselves under many pretences and excuses, gave at last a flat denial. In order to equip a fleet, a distribution by order of the council was made to all the maritime towns; and each of them was required, with the assistance of the adjacent counties, to arm as many vessels as were appointed them. The city of London was rated at 20 ships: and this is the first appearance, in Charles's reign, of ship money; a taxation which had once been imposed by Elizabeth, but which, when carried some steps farther by Charles, produced the most violent discontents.—These methods of supply were carried on with some moderation, till news arrived of the king of Denmark being totally defeated by count Tilly the Imperial general; but money then becoming more than ever necessary, it was suggested in council, that the most speedy, equal, and convenient method of supply was by a general loan from the subject, according as every man was assessed in the rolls of the last subsidy. That precise sum was required which each would have paid, had the vote of four subsidies been passed into a law: care, however, was taken, that the sums thus exacted were not to be called subsidies but loans; but it was impossible to avoid observing, that thus the liberty of the subject was entirely destroyed, and all parliaments rendered at once superfluous.

Many people throughout England refused these loans, and some were even active in encouraging their neighbours to insist upon their common rights and privileges. By warrant of the council, these were thrown into prison. Most of them patiently submitted to confinement, or applied by petition to the king, who commonly released them. Five gentlemen, however, Sir Thomas Darnel, Sir John Corbet, Sir Walter Earl, Sir John Heweningham, and Sir Edmond Hamden, demanded release, not as a favour from the court, but as their due by the laws of their country. No particular cause was assigned for their commitment. The special command of the king and council alone was pleaded. And it was alleged, that by law this was not sufficient reason for refusing bail or release to the prisoners. The question was brought to a solemn trial before the court of king's bench; and the whole kingdom was attentive to the issue of the cause. By the debates on this subject it appeared, that personal liberty had been secured by no less than six different statutes, and by an article in magna charta itself. It appeared, that, in times of turbulence and sedition, the princes infringed upon these laws; and of this also many examples were produced. The difficulty then lay

62 Five gentlemen resolved to stand trial.

Britain. to determine when such violent measures were necessary; but of that the court pretended to be the supreme judge. As it was legal, therefore, that these five gentlemen should plead the statute, by which they might demand bail, so it was expedient in the court to remand them to prison, without determining on the necessity of taking bail for the present. This was a cruel evasion of justice; and, in fact, satisfied neither party. The court insisted that no bail could be taken; the country exclaimed that the prisoners ought to be set free.

While the king was thus embroiled with his parliament at home, and with powerful nations abroad, he rashly engaged in a war with France, a kingdom with which he had but lately formed the most natural alliance. All historians agree that this war proceeded from the rivalship of the duke of Buckingham and cardinal Richelieu; both of whom were in love with the queen of France; and an inveterate enmity being thus produced between these favourites, they resolved to involve their respective nations in the dispute. However this be, war was declared against France; and Charles was taught to hope, that hostilities with that kingdom would be the surest means of procuring tranquillity at home.—The success of this war was proportionable to the wisdom with which it was commenced. Buckingham was appointed commander; and he being entirely unacquainted both with sea and land service, managed matters so ill, that he lost two thirds of his army, and returned in total discredit both as an admiral and general.

The discontents in England now rose to such an height, that there was reason to apprehend an insurrection or rebellion. Charles was also reduced to the greatest distress for want of money. That which he had levied by virtue of his prerogative came in very slowly, and it was dangerous to renew the experiment on account of the ill humour of the nation in general. A third parliament therefore was called, March 17th 1628; whom Charles plainly told at the beginning of the session, that "if they should not do their duties, in contributing to the necessities of the state, he must, in discharge of his conscience, use those other means which God had put into his hands, in order to save that which the follies of some particular men might otherwise put in danger." This parliament behaved in a much more reasonable manner than either of the two former ones. The nation was now really aggrieved by the late arbitrary proceedings. They began with voting against arbitrary imprisonments and forced loans; after which, five subsidies (280,000*l.*) were voted to the king. With this sum, though much inferior to his wants, Charles declared himself well satisfied; and even tears of affection started in his eye when informed of this concession; the commons, however, resolved not to pass this vote into a law, before they had obtained from the king a sufficient security that their liberties should be no longer violated as they had formerly been. They resolved to frame a law, which they were to call a *petition of right*, in which they should collect all the arbitrary exertions of the prerogative which Charles had exposed to their view, and these they were to assault at once by their petition. The grievances now complained of were, forced loans, benevolences, taxes without consent of parliament, arbitrary imprisonments, billeting soldiers, and martial law. They pretended not, as they

Britain. affirmed, to any unusual power or privilege; nor did they intend to infringe the royal prerogative in any respect: they aimed only at securing those rights and privileges derived from their ancestors.

66
Duplicitv of
the king.
The king, on his part, now began plainly to show, that he aimed at nothing less than absolute power. This reasonable petition he did his utmost to evade, by repeated messages to the house, in which he always offered his royal word that there should be no more infringements on the liberty of the subject. These messages, however, had no effect on the commons: they knew how insufficient such promises were, without further security; and therefore the petition at last passed both houses, and nothing was wanting but the royal assent to give it the force of a law. The king accordingly came to the house of peers, sent for the commons, and being seated in the chair of state, the petition was read to him. In answer to it, he said, "The king willeth, that right be done according to the laws and customs of the realm, and that the statutes be put into execution; that his subjects may have no cause to complain of any wrong or oppression contrary to their just rights and liberties, to the preservation whereof he holds himself in conscience as much obliged as of his own prerogative."

This equivocal answer was highly resented. The commons returned in very ill humour. Their indignation would undoubtedly have fallen on the unfortunate catholics, had not their petition against them already received a satisfactory answer. To give vent to their present wrath, therefore, they fell on Dr Manwaring, who had preached a sermon, and, at the special command of the king, printed it; which was now found to contain doctrines subversive of all civil liberty. It taught, that though property was commonly lodged in the subject, yet, whenever any exigency required supply, all property was transferred to the sovereign; that the consent of parliament was not necessary for the imposition of taxes; and that the divine laws required compliance with every demand, however irregular, which the prince should make upon his subjects. For these doctrines Manwaring was sentenced to be imprisoned during the pleasure of the house; to be fined 1000*l.* to the king; make submission and acknowledgment for his offence; be suspended three years; be incapable of holding any ecclesiastical dignity or secular office; and that his book be called in and burnt. No sooner, however, was the session ended, than Manwaring received a pardon, and was promoted to a living of considerable value. Some years afterwards he was promoted to the see of St Asaph. At last, the king, He at last
63
seeing it was impossible to carry his point, yielded to give his as-
sent to the
the importunities of parliament. He came to the petition.
house of peers, and pronouncing the usual form of words, "Let it be law as is desired," gave full sanction and authority to the petition. The house resounded with acclamations, and the bill for five subsidies immediately passed.

The commons, however, were not yet satisfied; they began again to attack Buckingham, against whom they were implacable: they also asserted, that the levying of tonnage and poundage without consent of parliament was a palpable violation of the ancient liberties of the people, and an open infringement of the petition of right so lately granted. The king, in order to prevent a re-
69

Britain.
70
Buckingham murdered.

monstrance on that subject, suddenly prorogued the parliament, on June 26th, 1628.

The commons soon got rid of their enemy Buckingham; who was murdered, on the 23d of August this same year, by one Felton who had formerly served under him as a lieutenant. The king did not appear much concerned at his death, but retained an affection for his family throughout his whole lifetime. He desired also that Felton might be tortured, in order to extort from him a discovery of his accomplices; but the judges declared, that though that practice had been formerly very common, it was altogether illegal.

71
Contentions about tonnage and poundage.

In 1629, the usual contentions between the king and his parliament continued. The great article on which the commons broke with their sovereign, and which finally created in him a disgust at all parliaments, was their claims with regard to tonnage and poundage. The dispute was, whether this tax could be levied without consent of parliament or not. Charles, supported by multitudes of precedents, maintained that it might; and the parliament, in consequence of their petition of right, asserted that it could not. The commons were resolved to support their rights: and the disputes concerning tonnage and poundage went hand in hand with some theological controversies; particularly concerning Arminianism, which the Puritans, who now formed the majority of the nation, opposed with the greatest violence; and which consequently crept in among those who professed episcopacy, where it hath still maintained its ground more than in any other party.

The commons began with summoning before them the officers of the custom-house, to give an account by what authority they had seized the goods of those merchants who had refused to pay the duties of tonnage and poundage. The barons of exchequer were questioned with regard to their decrees on that head. The sheriff of London was committed to the Tower for his activity in supporting the officers of the custom-house. The goods of Rolles, a merchant, and member of the house, being seized for his refusal to pay the duties, complaints were made of this violence, as if it were a breach of privilege. Charles, on the other hand, supported his officers in all these measures, and the quarrel between him and the commons became every day higher. Sir John Elliot framed a remonstrance against tonnage and poundage, which he offered to the clerk to read; but it was refused, and he then read it himself. The question being called for, Sir John Finch the speaker said, that he had a command from the king to adjourn, and to put no question; upon which he rose and left the chair. The whole house was in an uproar; the speaker was pushed back into the chair, and forcibly held in it, till a short remonstrance was formed, which was instantaneously passed by almost universal acclamation. Papists and Arminians were now declared capital enemies to the commonwealth. Those who levied tonnage and poundage were branded with the same epithet. And even the merchants, who should voluntarily pay these duties, were declared betrayers of English liberty, and public enemies. The doors being locked, the gentleman-usher of the house of lords, who was sent by the king, could get no admittance till this remonstrance was finished. By the king's order he took the mace from the table, which put an end to their pro-

72
Parliament dissolved.

ceedings, and on the 10th of March the parliament was dissolved. Some of the members were imprisoned and fined; but this severity served only to increase the general discontent, and point out the sufferers as proper leaders for the popular party.

Britain.

Charles being now disgusted with parliaments, resolved to call no more; but finding himself destitute of resources, was obliged to make peace with the two powers with which he was at war. A treaty was signed with France on the 14th of April, and another with Spain on the 5th of November 1630, by which Charles bound himself to observe a neutrality with regard to the affairs on the continent. His conduct to his subjects cannot now appear entirely blameless, nor the general discontent altogether without foundation. As it, however, he had resolved to ruin himself, and to lose the small degrees of affection which remained among his subjects, Charles now began to set about making innovations in religion. Archbishop Laud had obtained a prodigious ascendancy over the king; and, by his superstitious attachment to foolish ceremonies, led him into a conduct that proved fatal to himself and to the kingdom in general. The humour of the nation ran at that time in a channel perfectly the reverse of superstition. The ancient ceremonies which had been sanctified by the permission and practice of the first reformers, could scarce be retained in divine service. Laud chose this time, of all others the most improper, for renewing the ceremonies of the fourth and fifth century, when the Christian church, as is well known, was sunk into those superstitions which were afterwards continued and augmented by the policy of the church of Rome. So openly were these tenets espoused, that not only the discontented Puritans believed the church of England to be relapsing fast into the Romish superstition, but the court of Rome itself entertained hopes of regaining its authority in this island. To forward Laud's good intentions, an offer was twice made him, in private, of a cardinal's hat; which he declined accepting. His answer was (as he says himself), that "something dwelt within him which would not suffer his compliance, till Rome was other than it is." It must be confessed, however, that though Laud deserved not the appellation of a *Papist*, the genius of his religion was, though in a less degree, the same with that of the Romish. The same profound respect was exacted to the sacerdotal character; the same submission to the creeds and decrees of synods and councils required; the same pomp and ceremony was affected in worship; and the same superstitious regard to days, postures, meats, and vestments. Orders were given, and rigorously insisted on, that the communion-table should be removed from the middle of the area where it had hitherto stood in all churches except cathedrals. It was placed at the east end, railed in, and denominated an *altar*; as the clergyman who officiated commonly received the appellation of *priest*. All kinds of ornaments, especially pictures, were introduced. Some of these, upon inquiry, were found to be the very same that were to be met with in the mass-book. The crucifix too, that perpetual consolation of all pious Catholics, and terror to all sound Protestants, was not forgot on this occasion.

73
Peace with France and Spain.

74
The king attempts to introduce new religious ceremonies.

In return for Charles's indulgence towards the church, Laud and his followers took care to magnify

Britain. on every occasion the regal authority, and to treat with the utmost disdain or detestation all puritanical pretensions to a free and independent constitution. From this subjection, however, they took care to exclude themselves, and insisted upon a divine and apostolical charter in preference to a legal and parliamentary one. The sacerdotal character was magnified as sacred and indefeasible; all right to spiritual authority, or even to private judgment in spiritual subjects, was refused to profane laymen: ecclesiastical courts were held by bishops in their own name, without any notice taken of the king's authority: and Charles, though extremely jealous of every claim in popular assemblies, seemed rather to encourage than repress those encroachments of his clergy.

75 The principles which exalted prerogative were put in practice during the whole time that Charles ruled without parliaments. He wanted money for the support of government; and he levied it, either by the revival of obsolete laws, or by violations of the privileges. Though humane and gentle in his nature, he gave way to severities in the star-chamber and high commission, which seemed necessary in order to support the present mode of administration, and suppress the rising spirit of liberty throughout the kingdom. Tonnage and poundage were continued to be levied by royal authority alone. The former arbitrary impositions were still exacted; and even new impositions laid upon different kinds of merchandize. The custom-house officers received orders from the council to enter into any house, warehouse, or cellar; to search any trunk or chest; and to break any bulk whatever, in default of the payment of customs. In order to exercise the militia, each county by an edict of the council was assessed in a certain sum for maintaining a muster-master appointed for that service. Compositions were openly made with recusants, and the Popish religion became a regular part of the revenue. A commission was granted for compounding with such as were possessed of crown-lands on defective titles; and on this pretence some money was exacted of the people, &c.

76 While the English were in the utmost discontent, and almost ready to break out in open rebellion by these arbitrary proceedings, Charles thought proper to attempt setting up episcopacy in Scotland. The canons for established ecclesiastical jurisdiction were promulgated in 1635, and were received without much appearance of opposition; yet with great inward apprehension and discontent. The first reading of the liturgy was attempted in the cathedral church of St Giles in Edinburgh, in 1637; but this produced such a tumult, that it was not thought safe to repeat the experiment. An universal combination against the religious innovations began immediately to take place; but Charles, as if obstinately bent on his own destruction, continued inflexible in his purpose, though he had nothing to oppose to the united force of the kingdom but a proclamation, in which he pardoned all past offences, and exhorted the people to be more obedient for the future, and to submit peaceably to the use of the liturgy. This proclamation hastened forward the insurrection which had been slowly advancing before. Four tables, as they were called, were formed in Edinburgh. One consisted of nobility, another of gentry, a third of ministers, and the fourth of burgesses.

Britain. The table of gentry was divided into many subordinate ones, according to their different counties. In the hands of the four tables, the authority of the whole kingdom was placed. Orders were issued by them, and every where obeyed with the utmost regularity; and among the first acts of their government was the production of the COVENANT.

78 This famous covenant consisted of a renunciation of Popery, formerly signed by James in his youth, and filled with many virulent invectives against that party. A bond of union followed, by which the subscribers obliged themselves to resist all religious innovations, and to defend each other against all opposition whatsoever: And all this for the greater glory of God, and the greater honour and advantage of their king and country. The covenant was subscribed by people of all ranks and conditions. Few disapproved of it in their hearts, and still fewer dared openly to condemn it. The king's ministers and counsellors themselves were mostly of the same way of thinking; and none but rebels to God, and traitors to their country, it was thought, would withdraw themselves from so salutary and pious a combination.

79 The king now began to be alarmed. He sent the marquis of Hamilton, as commissioner, with authority to treat with the covenanters. He required the covenant to be renounced and recalled; and he thought that on his part he made very satisfactory concessions, when he offered to suspend the canons and liturgy till in a fair and legal way they could be received, and to model the high commission that it should no longer give offence to his subjects. In answer to this demand the covenanters told him, they would sooner renounce their baptism; and invited the commissioner himself to sign it. Hamilton returned to London; made another fruitless journey with new conclusions to Edinburgh; returned again to London, and was immediately sent back with still more satisfactory concessions. The king was now willing to abolish entirely the canons, the liturgy, and the high-commission court; he even resolved to limit extremely the power of the bishop, and was content if on any terms he could retain that order in the church of Scotland. And to ensure all these gracious offers, he gave Hamilton authority to summon first an assembly, and then a parliament, where every national grievance should be redressed.—These successive concessions only showed the weakness of the king, and encouraged the malcontents to rise in their demands. The offer, however, of an assembly and a parliament, in which they expected to be entirely masters, was very willingly embraced by the covenanters.

80 Charles, perceiving what advantage his enemies had reaped from their covenant, resolved to have a covenant also on his side; and he ordered one to be drawn up for that purpose. It consisted of the same violent renunciation of Popery with the other; which, though the king did not approve of it, he thought proper to adopt, in order to remove all the suspicions entertained against him. As the covenanters, in their bond of mutual defence against all opposition, had been careful not to except the King; Charles had formed a bond which was annexed to this renunciation, and which expressed the subscribers loyalty and duty to his majesty. But the covenanters perceiving that this new covenant was only meant to weaken and divide

^{Britain.} them, received it with the utmost scorn and detestation. And, without delay, they proceeded to model the assembly from which such great achievements were expected.

⁸¹
^{Violent}
^{proceedings}
^{of the assembly.}
^{bly.} The assembly met at Glasgow in 1638. A firm determination had been entered into of utterly abolishing episcopacy; and, as a preparative to it, there was laid before the presbytery of Edinburgh, and solemnly read in all the churches of the kingdom, an accusation against the bishops, as guilty, all of them, of heresy, simony, bribery, perjury, cheating, incest, adultery, fornication, common-swearing, drunkenness, gaming, breach of the sabbath, and every other crime which had occurred to the accusers. The bishops sent a protest, declining the authority of the assembly; the commissioner too protested against that court, as illegally constituted and elected; and, in his majesty's name, dissolved it. This measure was foreseen, and little regarded. The court still continued to sit and do business. All the acts of assembly, since the accession of James to the crown of England, were, upon pretty reasonable grounds, declared null and invalid. The acts of parliament which affected ecclesiastical affairs were on that very account supposed to have no authority. And thus the whole fabric which James and Charles, in a long course of years, had been rearing with much care and policy, fell at once to the ground. The covenant likewise was ordered to be signed by every one, under pain of excommunication.

⁸²
^{Preparati-}
^{on for}
^{war by the}
^{covenanters.} In 1639, the covenanters prepared in earnest for war. The earl of Argyle, though he long seemed to temporize, at last embraced the covenant; and he became the chief leader of that party. The earls of Rothes, Cassils, Montrose, Lothian, the lords Lindesay, Loudon, Yeister, and Balmerino, also distinguished themselves. Many of their officers had acquired reputation in the German wars, particularly under Gustavus; and these were invited over to assist their country in their present necessity. The command was entrusted to Lesly, a soldier of experience and ability. Forces were regularly enlisted and disciplined. Arms were commissioned and imported from foreign countries. A few castles which belonged to the king, being unprovided of victuals, ammunition, and garri- sons, were soon seized. And the whole country, except a small part, where the marquis of Huntly still adhered to the king, being in the covenanters hands, was soon put into a tolerable posture of defence.

⁸³
^{By the king.} Charles, on the other hand, was not deficient in his endeavours to oppose this formidable combination. By regular economy he had not only paid all the debts contracted in the French and Spanish wars, but had amassed a sum of £ 200,000; which he had reserved for any sudden exigency. The queen had great inter- mit with the catholics, both from the sympathy of religion, and from the favours and indulgences which she had been able to procure them. She now employed her credit, and persuaded them, that it was reasonable to give large contributions, as a mark of their duty to the king, during this urgent necessity: And thus, to the great scandal of the Puritans, a considerable supply was gained. The king's fleet was formidable and well supplied. Having put 5000 land forces on board, he intrusted it to the marquis of Hamilton, who had orders to sail to the frith of Forth, and cause a diver-

sion in the forces of the malcontents. An army was levied of near 20,000 foot and 3000 horse; and was put under the command of the earl of Arundel, a nobleman of great family, but celebrated neither for military nor political abilities. The earl of Essex, a man of strict honour, and extremely popular, especially among the soldiery, was appointed lieutenant-general; The earl of Holland was general of the horse. The king himself joined the army, and he summoned all the peers of England to attend him. The whole had the appearance of a splendid court rather than a military armament, and in this situation the camp arrived at Berwick.

The Scottish army was equally numerous with that of the king, but inferior in cavalry. The officers had more experience; and the soldiers, though ill disciplined and armed, were animated, as well by the national aversion to England, and the dread of becoming a province to their old enemy, as by that religious enthusiasm which was the occasion of the war. Yet so prudent were their leaders, that they immediately sent very submissive messages to the king, and craved leave to be admitted to a treaty.—Charles, as usual, took the worst course. He concluded a sudden pacifica- tion, in which it was stipulated, that he should withdraw his fleet and army; that within 48 hours the Scots should dismiss their forces; that the king's forts should be restored to him; his authority be acknowledged; and a general assembly and parliament be immediately summoned, in order to compose all differences.

This peace was of no long duration. Charles could not prevail on himself to abandon the cause of episcopacy, and secretly intended to seize every favourable opportunity to recover the ground he had lost. The assembly, on the other hand, proceeded with the utmost fury and violence. They voted episcopacy to be unlawful in the church of Scotland: they stigmatized the canons and liturgy as popish: they denominated the high commission tyranny. The parliament, which sat after the assembly, advanced pretensions which tended to diminish the civil power of the monarch; and, what probably affected Charles still more, they were proceeding to ratify the acts of assembly, when by the king's instructions Traquair the commissioner pro- rogued them. And on account of these claims, which might have been easily foreseen, war was recommenced the same year.

No sooner had Charles concluded the peace, than he found himself obliged to disband his army, on account of his want of money; and as the soldiers had been held together merely by mercenary views, it was not possible, without great trouble, expence, and loss of time, to reassemble them. On the contrary, the covenanters, in dismissing their troops, had been careful to preserve nothing but the appearance of a pacification. The officers had orders to be ready on the first summons: The soldiers were warned not to think the nation secure from an English invasion: And the religious zeal which animated all ranks of men made them immediately fly to their standards, as soon as their trumpet was sounded by their spiritual and temporal leaders.

In 1640, however, the king made shift to draw an army together; but finding himself unable to support them, was obliged to call a parliament after an inter- mission

Britain.

84
Peace con-
cluded.85
War again
declared.86
A parlia-
ment called.

mission of about 11 years. As the sole design of the king's calling this parliament was to obtain a supply, and the only reason they had for attending was to procure a redress of grievances, it is not to be supposed there could be any good agreement between them. The king accordingly insisted for money, and the parliament on their grievances, till a dissolution ensued. — To add to the unpopularity of this measure, the king, notwithstanding his dissolving the parliament, allowed the convocation to sit; a practice of which, since the reformation, there had been very few examples, and which was now by many deemed very irregular. Besides granting to the king a supply from the spirituality, the convocation, jealous of innovations similar to those which had taken place in Scotland, imposed an oath on the clergy and the graduates in the universities, by which every one swore to maintain the established government of the church, by archbishops, bishops, deans, chapters, &c. These steps were deemed illegal, because not ratified by consent of parliament; and the oath, containing an &c. in the middle of it, became a subject of general ridicule.

The king, disappointed of parliamentary subsidies, was obliged to have recourse to other expedients. The ecclesiastical subsidies served him in some stead; and it seemed but just that the clergy should contribute to the expence of a war which had been in a great measure of their own raising. He borrowed money from his ministers and courtiers; and so much was he beloved among them, that above 300,000 l. were subscribed in a few days. Some attempts were made towards forcing a loan from the citizens; but still repelled by the spirit of liberty, which was now become unconquerable. A loan of 40,000 l. was extorted from the Spanish merchants who had bullion in the tower. Coat and conduct money for the soldiery was levied on the counties; an ancient practice, but which was supposed to be abolished by the petition of right. All the pepper was bought from the East India Company upon trutt; and sold, at a great discount, for ready money. A scheme was proposed for coining two or three hundred thousand pounds of base money. Such were the extremities to which Charles was reduced. The fresh difficulties, which amidst the present distresses were every day raised, with regard to the payment of ship-money, obliged him to exert continual acts of authority, augmented extremely the discontents of the people, and increased his indigence and necessities.

The present expedients, however, enabled the king, though with great difficulty, to march his army, consisting of 19,000 foot and 2000 horse. The earl of Northumberland was appointed general; the earl of Strafford, who was called over from Ireland, lieutenant-general; lord Conway, general of the horse. A small fleet was thought sufficient to serve the purposes of this expedition. The Scots, though somewhat superior, were sooner ready than the king's army, and marched to the borders of England. Notwithstanding their warlike preparations and hostile attempts, the covenanters still preserved the most submissive language to the king; and entered England with no other design, they said, than to obtain access to the king's presence, and lay their humble petition at his royal feet. At Newburn upon Tyne they were opposed by a detachment of 4500 men

under Conway, who seemed resolute to dispute with them the passage of the river. The Scots first intreated them, with great civility, not to stop them in their march to their gracious sovereign; and then attacked them with great bravery, killed several, and chased the rest from their ground. Such a panic seized the whole English army, that the forces at Newcastle fled immediately to Durham; and not yet thinking themselves safe, they deserted that town, and retreated into Yorkshire.

The Scots continued to advance; they dispatched messengers to the king, who was now arrived at York. They took care, after the advantage they had gained, to redouble their expressions of loyalty, duty, and submission to his person; and they even made apologies full of sorrow and contrition for their late victory. Charles was in a very distressed condition; and, in order to prevent the further advance of the Scots, agreed to a treaty, and named 16 English noblemen to meet with 11 Scots commissioners at Rippon. Strafford, upon whom, by reason of Northumberland's sickness, the command of the army had devolved, advised Charles rather to put all to hazard, than submit to such unworthy terms as he saw would be imposed upon him. He advised him to push forward and attack the Scots, and bring the affair to a quick decision; and if he was ever so unsuccessful, nothing worse could befall him than what from his inactivity he would certainly be exposed to; and, to show how easily this project might be executed, he ordered an assault to be made on some quarters of the Scots, and gained an advantage over them. This salutary advice Charles had not resolution to follow. He therefore resolved to call a council of the peers; and as he foresaw that they would advise him to call a parliament, he told them in his first speech, that he had already taken that resolution. In order to subvert both armies (for the king was obliged to pay his enemies, in order to save the northern counties), Charles wrote to the city, desiring a loan of 200,000 l. And the peers at York, whose authority was now much greater than that of their sovereign, joined in the same request.

The parliament met November 3d 1640: the house of commons had never been observed so numerous; and, that they might strike a decisive blow at once against the court, they began with the impeachment of the earl of Strafford. That nobleman, who was considered as prime minister, both on account of the credit he possessed with his master, and his own uncommon vigour and capacity, had now the misfortune of having incurred the hatred of all the three kingdoms. The Scots looked upon him as the capital enemy of their country. He had engaged the parliament of Ireland to advance large subsidies to be employed in a war against them: he had levied an army of 9000 men, with which he had menaced all their western coast: he had obliged the Scots who lived under his government to renounce the covenant, &c.: he had governed Ireland, first as deputy, and then as lord-lieutenant, during eight years, with great vigilance, activity, and prudence, but with very little popularity. In a nation soaverse to the English government and religion, these very virtues were sufficient to draw on him the public hatred. His manners, besides, were at bottom haughty, rigid, and severe; and no sooner did adversity begin to seize him, than the cour-

High
opinion of
Strafford.

(1)

^{Britain.} cealed aversion blazed up at once, and the Irish parliament used every expedient to aggravate the charge against him.

The universal discontent which prevailed throughout the English nation was all pointed against the earl of Strafford; though for no other reason but because he was the minister of state whom the king most favoured and trusted. His extraction was honourable, his paternal fortune considerable: yet envy attended his sudden and great elevation; and his former associates in popular counsels, finding that he owed his advancement to the desertion of their cause, represented him as the great apostate of the commonwealth, whom it behoved them to sacrifice as a victim to public justice.

From so terrible a combination against a single person, nothing else could be expected than what really happened. Strafford was impeached, most unjustly condemned, and at last executed, in the year 1641. It was not without extreme difficulty that the king could be brought to consent to his execution. He came to the house of lords, where he expressed his resolution never to employ Strafford again in any public business; but with regard to the treason for which he was condemned, he professed himself totally dissatisfied. The commons voted it a breach of privilege for the king to take notice of any bill depending before the house. Charles did not perceive, that his attachment to Strafford was the chief motive for the bill; and the greater proof he gave of this attachment to his favourite minister, the more inevitable did he render his destruction. The house of lords were intimidated, by popular violence, into passing the bill of attainder against the unfortunate earl. The same battery was next employed to force the king's assent. The populace flocked about Whitehall, and accompanied their demand of justice with the loudest clamours and most open menaces. A thousand idle reports of conspiracies, insurrections, and invasions, were spread abroad. On whatever side the king cast his eyes, he saw no resource nor security. All his servants, consulting their own safety rather than their master's honour, declined interposing with their advice between him and his parliament. The queen, terrified at the apparance of so great danger, pressed Charles, with tears, to satisfy his people in this demand, which it was hoped would finally content them. Archbishop Juxon alone had the courage to advise him, if he did not approve of the bill, by no means to consent to it.

Strafford, hearing of the king's irresolution and anxiety, wrote to him a letter, in which he desired his own execution, in order to give peace to the nation: and at last, after the most violent anxiety and doubt, Charles granted a commission to four noblemen, in his name, to give the royal assent to the bill; flattering himself, perhaps, that as neither his will consented to the deed, nor was his hand immediately engaged in it, he was the more free from all the guilt which attended it. These commissioners he empowered at the same time to give his assent to a bill yet more fatal to himself, viz. That the present parliament should not be dissolved, prorogued, or adjourned, without their own consent.

By this last bill Charles rendered the power of his enemies perpetual, as it was already uncontrollable. The reason of this extraordinary step was, that the

commons, from policy, more than necessity, had embraced the expedient of paying the two armies by borrowing money from the city. These loans they repaid afterwards by taxes levied on the people. At last the citizens, either of themselves, or by suggestion, began to start difficulties with regard to a farther loan which was demanded. "We make no scruple of trusting the parliament (said they), were we certain that the parliament was to continue till our repayment. But, in the present precarious situation of affairs, what security can be given us for our money?" In order to obviate this objection, the abovementioned bill was suddenly brought in, and having passed both houses with great rapidity, was at last brought to the king; who, being oppressed with grief on account of the unhappy fate of Strafford, did not perceive the pernicious consequence of the bill.

All this time the commons had ruled in other respects with an uncontrollable sway. Soon after the impeachment of Strafford, Laud was accused of high treason, and committed to custody. To avoid the like fate, prisoned lord keeper Finch and secretary Windebank fled, the one into Holland, the other into France. The house instituted a new species of guilt, termed *delinquency*: those who had exercised the powers necessary for the defence of the nation during the late military operations, were now called *delinquents*. In consequence of this determination, many of the nobility and prime gentry of the nation, while only exerting, as they justly thought, the legal powers of magistracy, found themselves unexpectedly involved in this new crime of delinquency. The commons, however, by their institution, reaped this multiplied advantage; they disarmed the crown, they established the maxims of rigid law and liberty, and they spread the terror of their own authority. All the sheriffs who had formerly exacted ship money, though by the king's express command, were now declared delinquents. The farmers and officers of the customs who had been employed during so many years in levying tonnage, poundage, &c. were likewise denominated criminals of the same kind, and were afterwards glad to compound for a pardon, by paying 150,000*l*. Every discretionary or arbitrary sentence of the star-chamber and high commission courts, which from their very nature were arbitrary, underwent a severe scrutiny; and all those who had concurred in such sentences, were voted to be liable to the penalties of law. No minister of the king, no member of the council, but what found himself exposed by this determination. The judges who had formerly given judgement against Hambden for refusing to pay ship money, were accused before the peers, and obliged to find security for their appearance. Berkley, a judge of the king's bench, was seized by order of the house, even when sitting in his tribunal. The sanction of the lords and commons, as well as that of the king, was declared necessary for the confirmation of ecclesiastical canons. Monopolists and projectors, if of the king's party, were now expelled the house; but one Mildmay, a notorious monopolist, was allowed to keep his seat, because he was of the popular party. In short, the constitution was completely new-modelled; and during the first period of the transactions of this remarkable parliament, if we except Strafford's attainder, their merits in other respects so much overbalance their mistakes, as to in-

Britain. title them to very ample praises from all lovers of liberty. Not only were their services rewarded, and grievances redressed; but a provision for the future was made by excellent laws against the return of the like complaints. And if the means by which they obtained such mighty advantages favoured of a of artifice, sometimes of violence; it is to be considered, that revolutions of government cannot be effected by mere force of argument and reasoning; and that, factions being once excited, men can neither so firmly regulate the tempers of others, nor their own, as to ensure themselves against all exorbitancies.

Had the parliament stopped here, it had been happy for the nation; but they were now resolved to be satisfied with nothing less than the total abolition of monarchy. The king had promised to pay a visit, this summer, to his subjects in Scotland, in order to settle their government; and though the English parliament was very importunate with him to lay aside that journey, they could not prevail with him so much as to delay it. Having failed in this, they appointed a small committee of both houses to attend him, in order, as was pretended, to see the articles of pacification executed, but really to be spies upon the king, to extend still farther the ideas of parliamentary authority, as well as eclipse his majesty. Endeavours were even used, before Charles's departure, to have a protector of the kingdom appointed, with a power to pass laws without having recourse to the king. About this time, the king concluded the marriage of the princess Mary with William prince of Orange. He did not conclude this alliance without communicating his intentions to parliament, who were very well satisfied with the proposal. They adjourned from Sept. 9th, to October 20th, 1641.

Charles arrived in Scotland August 14th 1641, with a design to give full satisfaction if possible to this restless kingdom. Some good regulations were made; the bench of bishops, and lords of articles, were abolished; it was ordained that no man should be created a Scottish peer, who possessed not 10,000 marks (above 500 l.) of annual rent in the kingdom; a law for triennial parliaments was likewise enacted; and it was ordained, that the last act of every parliament should be to appoint the time and place for holding the parliament next ensuing; the king was also deprived of that power formerly exercised, of issuing proclamations which enjoined obedience under the penalty of treason. But the most fatal blow given to royal authority, and what in a manner dethroned the prince, was an article, that no member of the privy-council, in whose hands, during the king's absence, the whole administration lay, no officer of state, none of the judges, should be appointed but by advice and approbation of parliament. Charles even agreed to deprive of their seats four judges who had adhered to his interests; and their place was supplied by others more agreeable to the ruling party. Several of the covenanters were also sworn of the privy-council; and all the ministers of state, counsellors and judges, were, by law, to hold their places during life or good behaviour. The king, while in Scotland, conformed himself to the established church; he bestowed pensions and preferments on Henderson, Gillespy, and other popular preachers; he practised every art to soften, if not to gain, his greatest enemies; the earl of Argyll was created a marquis, Lord Loudon

an earl, and Lesly was dignified with the title of *Lord Leven*. But though Charles was thus obliged to heap favours on his enemies and overlook his friends, the former were not satisfied, as believing all he did proceeded from artifice and necessity; while some of the latter were disgusted, and thought themselves ill rewarded for their past services.

Argyle and Hamilton, being seized with an apprehension, real or pretended, that the earl of Crawford and others meant to assassinate them, left the parliament suddenly, and retired into the country: but, upon invitation and assurances, returned in a few days. This event, which in Scotland had no visible consequence, was commonly denominated the *incident*; but though the incident had no effect in Scotland, it was attended with very serious consequences in England. The English parliament immediately took the alarm; or rather probably were glad of the hint: they insinuated to the people, that the *malignants*, so they called the king's party, had laid a plot at once to murder them and all the gentry in both kingdoms. They applied therefore to Essex, whom the king had left general of the south of England; and he ordered a guard to attend them.

In the mean time a most dangerous rebellion broke out in Ireland, with circumstances of unparalleled horror, bloodshed, and desolation. The old Irish, by the wife conduct of James, had been fully subdued, and proper means taken for securing their dependence and subjection for the future; but their old animosity still remained, and only wanted an occasion to exert itself. This they obtained from the weak condition to which Charles was reduced, and this was made use of in the following manner.

Rebellion
is out
in Ireland.

One Roger More, a gentleman descended from an ancient Irish family, but of narrow fortune, first formed the project of expelling the English, and asserting the independency of his native country. He secretly went from chieftain to chieftain, and roused up every latent principle of discontent. He maintained a close correspondence with lord Maeguire, and Sir Phelim O'Neale, the most powerful of the old Irish; and by his persuasions soon engaged not only them, but the most considerable persons of the nation, into a conspiracy; and it was hoped, the English of the pale, as they were called, or the old English planters, being all catholics, would afterwards join the party which restored their religion to its ancient splendor and authority. The plan was, that Sir Phelim O'Neale, and the other conspirators, should begin an insurrection on one day throughout the provinces, and should attack all the English settlements; and that, on the very same day, lord Maeguire and Roger More should surprize the castle of Dublin. They fixed on the beginning of winter for the commencement of this revolt; that their might be more difficulty in transporting forces from England. Succours to themselves, and supplies of arms, they expected from France, in consequence of a promise made them by cardinal Richelieu; and many Irish officers who had served in the Spanish troops had given assurances of their concurrence, as soon as they saw an insurrection entered upon by their Catholic brethren. News, which every day arrived from England, of the fury expelled by the commons against all Papists, struck fresh terror into the Irish nation, and

Britain. lated the conspirators to execute their fatal purpose, and assured them of the concurrence of their countrymen.

Such a propensity was discovered in all the Irish to revolt, that it was deemed unnecessary as well as dangerous to trust the secret in many hands; and though the day appointed drew nigh, no discovery had yet been made to government. The king, indeed, had received information from his ambassadors, that something was in agitation among the Irish in foreign parts; but though he gave warning to the administration in Ireland, his intelligence was entirely neglected. They were awakened from their security only that very day before the commencement of hostilities. The castle of Dublin, by which the capital was commanded, contained arms for 10,000 men, with 35 pieces of cannon, and a proportionable quantity of ammunition. Yet was this important place guarded, and that too without any care, by no greater force than 50 men. Macguire and More were already in town with a numerous band of their retainers; others were expected that night; and next morning they were to enter upon what they esteemed the easiest of all enterprises, the surprisal of the castle. O'Connellly, however, an Irishman, but a Protestant, discovered the conspiracy. The justices and council fled immediately to the castle, and reinforced the guards. The city was immediately alarmed, and all the Protestants prepared for defence. More escaped, but Macguire was taken; and Mahon, one of the conspirators, being likewise seized, first discovered to the justices the project of a general insurrection.

104
Horrid cruelties of the rebels;

But though O'Connellly's discovery saved the castle from a surprize, Mahon's confession came too late to prevent the intended insurrection. O'Neale and his confederates had already taken arms in Ulster. The houses, cattle, and goods of the English were first seized. Those who heard of the commotions in their neighbourhood, instead of deserting their habitations, and assembling together for mutual protection, remained at home in hopes of defending their property; and fell thus separately into the hands of their enemies. An universal massacre now commenced, accompanied with circumstances of unequalled barbarity. No age, sex, or condition, was spared. All connections were dissolved, and death was dealt by that hand from which protection was implored and expected. All the tortures which wanton cruelty could devise, all the lingering pains of body, the anguish of mind, the agonies of despair, could not satiate revenge excited without injury, and cruelty derived from no cause. Such enormities, in short, were committed, that though attested by undoubted evidence, they appear almost incredible. The stately buildings or commodious habitations of the planters, as if upbraiding the sloth and ignorance of the natives, were consumed with fire, or laid level with the ground; and where the miserable owners, shut up in their houses, and preparing for defence, perished in the flames, together with their wives and children, a double triumph was afforded to their insulting foes. If any where a number assembled together, and resolved to oppose the assassins; they were disarmed by capitulations, and promises of safety, confirmed by the most solemn oaths. But no sooner had they surrendered, than the rebels, with perfidy equal to their cruelty,

N^o 55.

made them share the fate of their unhappy countrymen. Others tempted their prisoners, by the fond love of life, to embroil their hands in the blood of friends, brothers, or parents; and having thus rendered them accomplices in their own guilt, gave them that death which they sought to shun by deserting it.

Such were the barbarities by which Sir Phelim O'Neale and the Irish in Ulster signalized their rebellion. More, shocked at the recital of these enormities, flew to O'Neale's camp; but found that his authority, which was sufficient to excite the Irish to a rebellion, was too feeble to restrain their inhumanity. Soon after, he abandoned the cause, and retired to Flanders. From Ulster, the flames of rebellion diffused themselves in an instant over the other three provinces of Ireland. In all places, death and slaughter were not uncommon; though the Irish in these other provinces pretended to act with moderation and humanity. But cruel and barbarous was their humanity! Not content with expelling the English from their houses, they stripped them of their very clothes, and turned them out naked and defenceless to all the severities of the season. The heavens themselves, as if conspiring against that unhappy people, were armed with cold and tempest unusual to the climate, and executed what the sword had left unfinished. By some computations, those who perished by all these cruelties are supposed to amount to 150 or 200,000; but by the most reasonable and moderate, they are made to amount only to 40,000; though probably even this account is not free of exaggeration.

The English of the pale, who probably were not at first in the secret, pretended to blame the insurrection, and to detest the barbarity with which it was accompanied. By their protestations and declarations they engaged the justices to supply them with arms, which they promised to employ in defence of government. But in a little time, the interests of religion were found to be more prevalent over them than regard and duty to their native country. They chose lord Gormonstone their leader; and, joining the old Irish, rivalled them in every act of cruelty towards the English Protestants. Besides many smaller bodies, dispersed over the kingdom, the main army of the rebels amounted to 20,000 men, and threatened Dublin with an immediate siege. Both the English and Irish rebels conspired in one imposture, by which they seduced many of their countrymen. They pretended authority from the king and queen, but especially the latter, for their insurrection; and they affirmed that the cause of their taking arms was to vindicate the royal prerogative, now invaded by the puritanical parliament. Sir Phelim O'Neale, having found a royal patent in the house of lord Caulfield, whom he had murdered, tore off the seal, and affixed it to a commission which he had forged for himself.

The king received intelligence of this insurrection while in Scotland, and immediately acquainted the Scots parliament with it. He hoped, as there had all along been such an outcry against Popery, that now, when that religion was appearing in its blackest colours, the whole nation would vigorously support him in the suppression of it. But here he found himself mistaken. The Scots considering themselves now as a republic, and conceiving hopes from the present distresses of Ire-

Britain.

105
Scots refuse to assist in quelling the rebellion.

land,

Britain. land, they resolved to make an advantageous bargain for the succours with which they should supply the neighbouring nation. Except dispatching a small body of forces, to support the Scots colonies in Ulster, they would, therefore, go no farther than to send commissioners to London, in order to treat with the parliament, to whom the sovereign power was in reality transferred. The king too, sensible of his utter inability to subdue the Irish rebels, found himself obliged, in this exigency, to have recourse to the English parliament, and depend on their assistance for supply. He told them that the insurrection was not, in his opinion, the result of any rash enterprize, but of a formed conspiracy against the crown of England. To their care and wisdom, therefore, he said, he committed the conduct and prosecution of the war, which, in a cause so important to national and religious interests, must of necessity be immediately entered upon, and vigorously pursued.

liament.

The English parliament, now re-assembled, discovered in each vote the same dispositions in which they had separated. Nothing less than a total abolition of monarchy would serve their turn. But this project it had not been in the power of the popular leaders to have executed, had it not been for the passion which seized the nation for the presbyterian discipline, and the wild enthusiasm which at that time attended it. By the difficulties and distresses of the crown, the commons, who possessed alone the power of supply, had aggrandized themselves; and it seemed a peculiar happiness, that the Irish rebellion had succeeded, at such a critical juncture, to the pacification in Scotland. That expression of the king's, by which he committed to them the care of Ireland, they immediately laid hold of, and interpreted in the most unlimited sense. They had on other occasions been gradually encroaching on the executive power of the crown, which forms its principal and most natural branch of authority; but with regard to Ireland, they at once assumed it, fully and entirely, as if delivered over to them by a regular gift or assignment. And to this usurpation the king was obliged passively to submit, both because of his inability to resist, and lest he should expose himself still more to the charge of favouring the rebels; a reproach eagerly thrown upon him by the popular party as soon as they heard that the Irish pretended to act by his commission. Nay, to complete their character, while they pretended the utmost zeal against the insurgents, they took no steps for its suppression, but such as likewise gave them the superiority in those commotions which they foresaw must be so soon excited in England. They levied money under pretence of the Irish expedition, but reserved it for purposes which concerned them more nearly: they took arms from the king's magazines, but still kept them with a secret intention of making use of them against himself: whatever law they deemed necessary for aggrandizing themselves, they voted, under colour of enabling them to recover Ireland; and if Charles withheld his royal assent, the refusal was imputed to those pernicious counsels which had at first excited to Popish rebellion, and which still threatened total ruin to the Protestant interest throughout his dominions. And though no forces were for a long time sent over into Ireland, and very little money remitted during the extreme distress of that kingdom; so strong

was the people's attachment to the commons, that the fault was never imputed to those pious zealots, whose votes breathed nothing but death and destruction to the Irish rebels.

The conduct of the parliament towards the king now became exceedingly unreasonable, unjust, and cruel. It was thought proper to frame a general remonstrance of the state of the kingdom; and accordingly the committee, which at the first meeting of the parliament had been chosen for that purpose, were commanded to finish their undertaking. The king returned from Scotland November 25th 1641. He was received in London with the shouts and acclamations of the populace, and with every demonstration of regard and affection. Sir Richard Gournay, lord mayor, a man of great merit and authority, had promoted these favourable dispositions; and had engaged the populace, who so lately insulted the king, and who so soon after made furious war upon him, to give him these marks of their dutiful attachment. But all the pleasure which Charles reaped from this joyful reception was soon damped by the remonstrance of the commons, which was presented to him together with a petition of the like nature. The bad counsels which he followed were there complained of; his concurrence in the Irish rebellion plainly insinuated; the scheme laid for the introduction of popery and superstition invigged against; and for a remedy to all these evils, the king was desired to entrust every office and command to persons in whom his parliament should have cause to confide. By this phrase, which was very often repeated in all the memorials and addresses of that time, the commons meant themselves and their adherents. To this remonstrance Charles was obliged to make a civil reply, notwithstanding his subjects had transgressed all bounds of respect and even good manners in their treatment of their sovereign.

108
Commons
flame the
Sovereignty.

It would be tedious to point out every invasion of the prerogative now attempted by the commons: but finding themselves at last likely to be opposed by the nobility, who saw their own depression closely connected with that of the crown, they openly told the upper house, that "they themselves were the representatives of the whole body of the kingdom, and that the peers were nothing but individuals, who held their seats in a particular capacity; and therefore, if their lordships will not consent to acts necessary for the preservation of the people, the commons, together with such of the lords as are more sensible of the danger, must join together and represent the matter to his majesty." Every method proper for alarming the populace was now put in practice. The commons affected continual fears of destruction to themselves and to the whole nation. They excited the people by never-ceasing inquiries after conspiracies, by reports of insurrections, by feigned intelligence of invasions from abroad, and by discoveries of dangerous combinations at home against Papists and their adherents. When Charles dismissed the guard which they had ordered during his absence, they complained; and, upon his promising them a new guard under the command of the earl of Lindsey, they absolutely refused the offer: they ordered halberds to be brought into the hall where they assembled, and thus armed themselves against those conspiracies with which they pretended they were hourly threatened.

Britain. threatened. Several reduced officers, and young gentlemen of the inns of court, during this time of distress and danger, offered their service to the king. Between them and the populace there passed frequent skirmishes, which ended not without bloodshed. By way of reproach, these gentlemen gave the rabble the name of *round-heads*, on account of their short cropped hair; while they distinguished the others by the name of *cavaliers*. And thus the nation, which was before sufficiently provided with religious as well as civil causes of quarrel, was also supplied with party-names, under which the factions might rendezvous and signalize their mutual hatred.

109
Round-heads and cavaliers.

These tumults continued to increase about Westminster and Whitehall. The cry continually resounded against bishops and *retained lords*. The former especially, being easily distinguishable by their habit, and being the object of violent hatred to all the sectaries, were exposed to the most dangerous insults. The archbishop of York, having been abused by the populace, hastily called a meeting of his brethren. By his advice a protestation was drawn and addressed to the king and the house of lords. The bishops there set forth, that though they had an undoubted right to sit and vote in parliament, yet in coming thither they had been menaced, assaulted, affronted, by the unruly multitude, and could no longer with safety attend their duty in the house. For this reason they protested against all laws, votes, and resolutions, as null and invalid, which should pass during the time of their forced absence. This protestation, which, though just and legal, was certainly ill-timed, was signed by twelve bishops, and communicated to the king, who hastily approved of it. As soon as it was presented to the lords, that house desired a conference with the commons, whom they informed of this unexpected protestation. The opportunity was seized with joy and triumph. An impeachment of high treason was immediately sent up against the bishops, as endeavouring to subvert the fundamental law, and to invalidate the authority of the legislature. They were, on the first demand, sequestered from parliament, and committed to custody. No man in either house ventured to speak a word in their vindication; so much was every one displeased at the egregious imprudence of which they had been guilty. One person alone said, that he did not believe them guilty of high treason; but that they were stark mad, and therefore desired they might be sent to bedlam.

110
Bishops retire from the house of lords.

111
Six members of parliament impeached by the king's order.

This was a fatal blow to the royal interest; but it soon felt a much greater from the imprudence of the king himself. Charles had long suppressed his resentment, and only strove to gratify the commons by the greatness of his concessions; but finding that all his compliance had but increased their demands, he could no longer contain. He gave orders to Herbert his attorney-general to enter an accusation of high treason, in the house of peers, against lord Kimbolton, one of the most popular men of his party, together with five commons, Sir Arthur Haslerig, Hollis, Hambden, Pym, and Strode. The articles were, That they had traiterously endeavoured to subvert the fundamental laws and government of the kingdom, to deprive the king of his regal power, and to impose on his subjects an arbitrary and tyrannical authority; that they had invited a foreign

reign army to invade the kingdom; that they had aimed at subverting the very right and being of parliaments; and had actually raised and countenanced tumults against the king. Men had scarce leisure to wonder at the precipitancy and imprudence of this impeachment, when they were astonished by another measure still more rash and unsupported. A serjeant at arms, in the king's name, demanded of the house the five members, and was sent back without any positive answer. This was followed by a conduct still more extraordinary. The next day, the king himself was seen to enter the house of commons alone, advancing through the hall, while all the members stood up to receive him. The speaker withdrew from his chair, and the king took possession of it. Having seated himself, and looked round him for some time, he told the house, that he was sorry for the occasion that forced him thither; that he was come in person to seize the members whom he had accused of high treason, seeing they would not deliver them up to his serjeant at arms. Then addressing himself to the speaker, he desired to know whether any of them were in the house; but the speaker, falling on his knees, replied, that he had neither eyes to see, nor tongue to speak, in that place, but as the house was pleased to direct him; and he asked pardon for being able to give no other answer. The king sat for some time, to see if the accused were present; but they had escaped a few minutes before his entry. Thus disappointed, perplexed, and not knowing on whom to rely, he next proceeded, amidst the invectives of the populace, who continued to cry out, *Privilege! privilege!* to the common council of the city, and made his complaint to them. The common council answered his complaints by a contemptuous silence; and, on his return, one of the populace, more insolent than the rest, cried out, "To your tents, O Israel!" a watch-word among the Jews, when they intended to abandon their princes.

Britain. 112
He goes in person to seize them.

When the commons assembled the next day, they pretended the greatest terror; and passed an unanimous vote that the king had violated their privileges, and that they could not assemble again in the same place, till they should obtain satisfaction, and have a guard for their security. The king had retired to Windsor, and from thence he wrote to his parliament, making every concession, and promising every satisfaction in his power. But they were resolved to accept of nothing unless he would discover his advisers in that illegal measure; a condition to which, they knew, that without rendering himself for ever vile and contemptible, he could not possibly submit.

113
Bad consequences of this attempt.

The commons had already stripped the king of almost all his privileges; the bishops were fled, the judges were intimidated; it now only remained, after securing the church and the law, that they should get possession of the sword also. The power of appointing governors and generals, and of levying armies, was still a remaining prerogative of the crown. Having therefore first magnified their terrors of Popery, which perhaps they actually dreaded, they proceeded to petition that the Tower might be put into their hands; and that Hull, Portsmouth, and the fleet, should be intrusted to persons of their choosing. These were requests, the complying with which subverted what remained of the constitution; however, such was the necessity of the times, that they were first contested, and then granted. At last, every compliance

114.
Commons demand possession of the executive power of the state.

compliance only increasing the avidity of making fresh demands, the commons desired to have a militia, raised and governed by such officers and commanders as they should nominate, under pretence of securing them from the Irish Papists, of whom they were under the greatest apprehension.

It was here that Charles first ventured to put a stop to his concessions; and that not by a refusal, but a delay. He was at that time at Dover attending the queen and the princess of Orange, who had thought it prudent to leave the kingdom. He replied to the petition, that he had not now leisure to consider a matter of such great importance; and therefore would defer an answer till his return. But the commons were well aware, that though this was depriving him even of the shadow of power, yet they had now gone too far to recede; and they were therefore desirous of leaving him no authority whatever, being conscious that themselves would be the first victims to its fury. They alleged, that the dangers and distempers of the nation were such as could endure no longer delay; and unless the king should speedily comply with their demands, they should be obliged, both for his safety and that of the kingdom, to embody and direct a militia by the authority of both houses. In their remonstrances to the king, they desired even to be permitted to command the army for an appointed time; which so exasperated him, that he exclaimed, "No, not for an hour." This peremptory refusal broke off all further treaty; and both sides were now resolved to have recourse to arms.

Charles, taking the prince of Wales with him, retired to York, where he found the people more loyal, and less infected with the frenzy of the times. He found his cause there backed by a more numerous party among the people than he had expected. The queen, who was in Holland, was making successful levies of men and ammunition by selling the crown-jewels. But before war was openly declared, the shadow of a negotiation was carried on, rather with a design to please the people than with any view of reconciliation. Nay, that the king might despair of all composition, the parliament sent him the conditions on which they were willing to come to an agreement. Their demands were contained in 17 propositions, and amounted to a total abolition of monarchical authority. They required that no man should remain in the council who was not agreeable to parliament; that no deed of the king's should have validity unless it passed the council, and was attested under their hand; and that all the officers of state should be chosen with consent of parliament; that none of the royal family should marry without consent of parliament or council; that the laws should be executed against Catholics; that the votes of Popish lords should be excluded; that the reformation of the liturgy and church-government should take place according to the advice of parliament; that the ordinance with regard to the militia be submitted to; that the justice of parliament may pass upon all delinquents; that a general pardon be granted with such exceptions as should be advised by parliament; that the forts and castles be disposed of by consent of parliament; and that no peers be made but with consent of both houses. War on any terms was esteemed, by the king and all his councillors, preferable to so ignominious a peace. Charles

accordingly resolved to support his authority by force of arms. "His towns (he said) were taken from him; his ships, his army, and his money: but there still remained to him a good cause, and the hearts of his loyal subjects; which, with God's blessing, he doubted not would recover all the rest." Collecting therefore some forces, he advanced southwards, and erected his royal standard at Nottingham.

The king found himself supported in the civil war by the nobility and more considerable gentry. They, dreading a total confusion of rank from the fury of the populace, enlisted themselves under the banner of their monarch: from whom they received, and to whom they communicated, their lustre. The concurrence of the bishops and church of England also increased the adherents of the king; but it may be safely affirmed, that the high monarchical doctrines so much inculcated by the clergy, had never done him any good. The bulk of the nobility and gentry who now attended the king in his distresses, breathed the spirit of liberty as well as of loyalty: and in the hopes alone of his submitting to a limited and legal government they were willing to sacrifice their lives and fortunes.

On the other hand, the city of London, and most of the great corporations, took part with the parliament; and adopted with zeal those democratical principles on which these assemblies were founded. The example of the Dutch commonwealth too, where liberty had so happily supported industry, made the commercial part of the nation desire to see a like form of government established in England. Many families also, who had enriched themselves by commerce, saw with indignation, that, notwithstanding their opulence, they could not raise themselves to a level with the ancient gentry; they therefore adhered to a power by whose success they hoped to acquire rank and consideration.

At first every advantage seemed to lie against the royal cause. The king was totally destitute of money. London, and all the sea-port, except Newcastle, being in the hands of parliament, they were secure of a considerable revenue; and the sea-men naturally following the disposition of the ports to which they belonged, the parliament had the entire dominion of the sea. All the magazines of arms and ammunition they seized at once; and their fleet intercepted the greatest part of those sent by the queen from Holland. The king, in order to arm his followers, was obliged to borrow the weapons of the train bands, under promise of restoring them as soon as peace should be settled. The name and qualities of his adherents alone, gave the king some compensation for all the advantages possessed by his adversaries. More bravery and industry were hoped for from the generous spirit of the nobles and gentry, than from the base disposition of the multitude. And as the landed gentlemen, at their own expense, levied and armed their tenants, besides an attachment to their masters, greater force and courage were to be expected from these militia troops than from the vicious and enervated populace of cities. Had the parliamentary forces, however, exerted themselves at first, they might have easily dissipated the small number the king had been able to collect, and which amounted to no more than 800 horse and 3000 foot; while his enemies were within a few days' march of him with 6000 men. In a short time the parliamentary army were ordered to

Britain.

march to Northampton; and the earl of Essex, who had joined them, found the whole to amount to 15,000. The king's army too was soon reinforced from all quarters; but still, having no force capable of coping with the parliamentary army, he thought it prudent to retire to Derby, and from thence to Shrewsbury, in order to countenance the levies which his friends were making in those parts. At Wellington, a day's march from Shrewsbury, he made a rendezvous of all his forces, and caused his military orders to be read at the head of every regiment. That he might bind himself by reciprocal obligations, he here protested solemnly before his whole army, that he would maintain the Protestant religion according to the church of England; that he would govern according to the known statutes and customs of the kingdom; and particularly, that he would observe inviolable the laws to which he had given his consent during this parliament, &c.

120
They gain an advantage over their enemies.

While Charles lay at Shrewsbury, he received the news of an action, the first which had happened in these parts, and wherein his party was victorious. On the appearance of commotions in England, the princes Rupert and Maurice, sons of the unfortunate elector palatine, had offered their service to the king; and the former at that time commanded a body of horse which had been sent to Worcester in order to watch the motions of Essex, who was marching towards that city. No sooner had the prince arrived, than he saw some cavalry of the enemy approaching the gates. Without delay he briskly attacked them, as they were desiling from a lane, and forming themselves. Colonel Sandys their commander was killed, the whole party routed, and pursued above a mile.

121
Battle of Edgell.

In 1642, October 23d, happened a general engagement at Edgell, in which, though the royalists were at first victorious, their impetuosity lost the advantage they had gained, and nothing decisive happened. Five thousand men, it is said, were found dead on the field of battle. Soon after, the king took Banbury and Reading; and defeated two regiments of his enemies at Brentford, taking 500 prisoners. Thus ended the campaign in 1642; in which, though the king had the advantage, yet the parliamentary army amounted to 24,000 men, and was much superior to his; notwithstanding which, his enemies had been so far humbled as to offer terms of peace.

In 1643, the treaty was carried on, but without any cessation of hostilities: and indeed the negotiation went no farther than the first demand on each side; for the parliament, finding no likelihood of coming to an accommodation, suddenly recalled their commissioners. On the 27th of April, Reading surrendered to the parliamentary forces under the earl of Essex, who commanded a body of 18,000 men. The earl of Northumberland united in a league for the king the counties of Northumberland, Cumberland, Westmorland, and the bishopric; and engaged some time after other counties in the same association. The same nobleman also took possession of York, and dislodged the forces of the parliament at Tadcaster, but his victory was not decisive. Other advantages were also gained by the royalists; the most important of which was the battle of Stratton, where the poet Waller, who commanded the parliament's army, was entirely defeated, and forced to fly with only a few horse to Bristol. This happened on

122
Association in favour of the king.

123
Parliamentary forces defeated at Stratton.

the 13th of July; and was followed by the siege of that city, which surrendered to prince Rupert on the 25th of the same month.

Britain.

Though the taking of Bristol had cost the royalists dear, yet such a continued run of success had greatly dispirited the opposite party; and such confusion now prevailed at London, that some proposed to the king to march directly to that city, which it was hoped might be reduced either by an insurrection of the citizens by victory or by treaty, and thus an end put to the civil disorders at once. This advice, however, was rejected, on account of the great number of the London militia; and it was resolved first to reduce Gloucester, in consequence of which the king would have the whole course of the Severn under his command. The rich and malcontent counties of the west having then lost all protection from their friends, might be enforced to pay large contributions as an atonement for their disaffection; an open communication could be preserved between Wales and these new conquests; and half the kingdom being entirely freed from the enemy, and thus united into one firm body, might be employed in re-establishing the king's authority throughout the remainder.

124
Charles besieges Gloucester.

The siege of this city commenced August 10th; but being defended by Maffey a resolute governor, and well garrisoned, made a vigorous defence. The consternation at London, however, was as great as if the enemy had been already at their gates; and in the midst of the general confusion, a design was formed by Waller of forcing the parliament to accept of some reasonable conditions of peace. He imparted his design to some others; but a discovery being made of their proceedings, he and two others were condemned to death. Waller, however, escaped with a fine of 10,000*l*. The city of Gloucester in the mean time was reduced to the utmost extremity; and the parliament, as their last resource, dispatched Essex with an army of 14,000 men, in order to force the king to raise the siege of that city. This he accomplished; and when he entered, found only one barrel of gunpowder left, and other provisions in the same proportion. On his return to London, he was intercepted by the king's army, with whom a most desperate battle ensued at Newbury which lasted till night. Though the victory was left undecided, Essex next morning proceeded on his march, and reached London in safety, where he received the applause for his conduct he deserved. The king followed him on his march; and having taken possession of Reading after the earl left it, he there established a garrison, and straitened by that means London and the quarters of the enemy.

125
He is forced to raise the siege.

126
Battle of Newbury.

In the north, during this summer, the earl, now created marquis of Newcastle, had raised a considerable force for the king; and great hopes of success were entertained from that quarter. There appeared, however, in opposition to him, two men on whom the event of the war finally depended, and who began about this time to be remarked for their valour and military conduct. These were, Sir Thomas Fairfax, son to the lord of that name; and Oliver Cromwell. The former gained a considerable advantage over the royalists at Wakefield, and took general Goring prisoner: the latter obtained a victory at Gainsborough over a party commanded by the gallant Cavendish, who perished in the action.

127
Advantages gained by Fairfax and Cromwell.

Britain. action. But both these defeats were more than compensated by the total rout of lord Fairfax at Atherton moor, and the dispersion of his army, which happened on the 31st of July. After this victory, the marquis of Newcastle sat down before Hull with an army of 15,000 men; but being beat off by a sally of the garrison, he suffered so much that he thought proper to raise the siege. About the same time, Manchester, who advanced from the eastern adjacent counties, having joined Cromwell and young Fairfax, obtained a considerable victory over the royalists at Horn castle; where the two last mentioned officers gained renown by their conduct and gallantry. And though fortune had thus balanced her favours, the king's party still remained much superior in those parts of England; and had it not been for the garrison of Hull, which kept Yorkshires in awe, a conjunction of the northern forces with the army in the south might have been made, and had probably enabled the king, instead of entering on the unfortunate, perhaps imprudent enterprize of Gloucester, to march directly to London, and put an end to the war. The battle of Newbury was attended with such loss on both sides, that it put an end to the campaign of 1643, by obliging both parties to retire into winter quarters.

The event of the war being now very doubtful, the king and parliament began both of them to look for assistance from other nations. The former cast his eyes on Ireland, the latter on Scotland. The parliament of England had ever invited the Scots, from the commencement of the civil dissensions, to interpose their mediation, which they knew would be very little favourable to the king, and which for that reason he had declined. Early in the spring 1643, this offer of mediation had been renewed, with no better success than before. The commissioners were also empowered to press the king to a compliance with the presbyterian worship and discipline. But this he absolutely refused, as well as to call a parliament in Scotland; so that the commissioners, finding themselves unable to prevail in any one of their demands, returned home highly dissatisfied. The English parliament being now in great distress, gladly sent commissioners to Edinburgh, to treat of a more close confederacy with the Scottish nation. The person they principally trusted to on this occasion was Sir Henry Vane, who in eloquence, address, capacity, as well as in art and dissimulation, was not even surpassed by any one in that age so famous for active talents. By his persuasions was framed at Edinburgh the SOLEMN LEAGUE AND COVENANT; which effaced all former protestations and vows taken in both kingdoms, and long maintained its credit and authority. In this covenant, the subscribers, besides engaging mutually to defend each other against all opponents, bound themselves to endeavour, without respect of persons, the extirpation of popery and prelacy, superstition, heresy, and profaneness; to maintain the rights and privileges of parliaments, together with the king's authority; and to discover and bring to justice all incendiaries and malignants. They vowed also to preserve the reformed religion established in the church of Scotland; but by the artifice of Vane, no declaration more explicit was made with regard to England and Ireland, than that their king should

be reformed according to the word of God, and the example of the purest churches. B-tain.

Great were the rejoicings among the Scots, that they should be the happy instruments of extending their mode of religion, and dissipating the profound darkness in which the neighbouring nations were involved. And being determined that the sword should carry conviction to all retractory minds, they prepared themselves with great vigilance and activity for their military enterprizes; so that, having added to their other forces the troops which they had recalled from Ireland, they were ready about the end of the year to enter England under their old general the earl of Leven, with an army of above 20,000 men. The king, in order to secure himself, concluded a cessation of arms with the Irish rebels, and recalled a considerable part of his army from Ireland. Some Irish catholics came over with these troops, and joined the royal army, where they continued the same cruelties and disorders to which they had been accustomed. The parliament voted, that no quarter in any action should ever be given them. But prince Rupert, by making some reprisals, soon expressed this inhumanity.

The campaign of 1644 proved very unfortunate to the royal cause. The forces brought from Ireland were landed at Meyline in North Wales, and put under the command of lord Byron. They besieged and took the castles of Hawarden, Beclon, Acton, and Deddington-house. No place in Cheshire or the neighbourhood now adhered to the parliament, except Lantwich; and to this place Byron laid siege in the depth of winter. Sir Thomas Fairfax, alarmed at so great a progress, assembled an army of 4000 men in Yorkshires; and having joined Sir William Brereton, was approaching to the camp of the royalists. Byron and his soldiers, elated with successes in Ireland, entertained a most profound contempt for their enemies. Fairfax suddenly attacked their camp. The swelling of the river by a thaw, divided one part of the army from another. That part exposed to Fairfax, being beat from their post, retired into the church at Acton, where being surrounded, they were all taken prisoners. The other retreated with precipitation; and thus was dissipated or rendered useless that body of forces which had come from Ireland. This happened on the 25th of January; and on the 11th of April, Colonel Bellasis was totally defeated at Selby in Yorkshires by Sir Thomas Fairfax, who had returned from Cheshire with his victorious forces. Being afterwards joined by lord Leven, the two generals sat down before the city of York; but being unable to invest that city completely, they were obliged to content themselves with incommoding it by a loose blockade. Upston, having assembled a body of 14,000 men, endeavoured to break into Suffex, Kent, and the southern association, which seemed well disposed to receive him; but was defeated by Waller at Cherington. At Newark, however, prince Rupert totally defeated the parliamentary army which besieged that place; and thus preserved the communication open between the king's northern and southern quarters.

The great advantages the parliament had gained in the north, seemed now to second their unwarrantable enterprizes, and finally to promise them success. Manchester

Britain. chester having taken Lincoln, had united his army to that of Leven and Fairfax; and York was now closely besieged by their numerous forces. That town, tho' vigorously defended by the marquis of Newcastle, was reduced to the last extremity, when prince Rupert, having joined Sir Charles Lucas who commanded Newcastle's horse, hastened to its relief with an army of 20,000 men. The Scots and parliamentary generals raised the siege, and drawing up on Marston moor, proposed to give battle to the royalists. Prince Rupert approached the town by another quarter, and interposing the river Ouse between him and the enemy, safely joined his forces to those of Newcastle. The marquis endeavoured to persuade him; that having so successfully effected his purpose, he ought to be contented with the present advantages, and leave the enemy, now much diminished by their losses, and discouraged by their ill success, to dissolve by those mutual dissensions which had begun to take place among them. The prince, however, hurried on by his natural impetuosity, gave immediate orders for fighting. The battle was lost, the royal army entirely pushed off the field, and the train of artillery taken. Immediately after this unfortunate action the marquis of Newcastle left the kingdom, and prince Rupert retired into Lancashire. The city of York was surrendered in a few days, and Newcastle soon after taken by storm.

133
York besieged by the parliamentary forces.

134
Royalists defeated at Marston moor.

This was a fatal blow to the royal cause, and far from being balanced by an advantage gained at Cropredy bridge by the king over Waller, or even by the disarming of Essex's forces, which happened on the 11th of September. On the 27th of October, another battle was fought at Newbury, in which the royalists were worsted, but soon after retrieved their honour at Dennington castle, which finished the campaign in 1644.

135
Extraordinary demands of the parliament.

In 1645, a negotiation was again set on foot, and the commissioners met at Uxbridge on the 30th of January; but it was soon found impossible to come to any agreement. The demands of the parliament were exorbitant; and, what was worse, their commissioners owned them to be nothing but preliminaries. The king was required to attaint, and except from a general pardon, 40 of the most considerable of his English subjects, and 19 of his Scots, together with all the Popish recusants who had borne arms for him. It was insisted that 48 more, with all the members of either house who had sat in the parliament called by the king at Oxford, all lawyers and divines who had embraced the king's party, should be rendered incapable of any office, be forbid the exercise of their profession, be prohibited from coming within the verge of the court, and forfeit the third of their estates to the parliament. It was required, that whoever had borne arms for the king should forfeit the tenth of their estates, or if that did not suffice, the sixth, for the payment of public debts. As if royal authority were not sufficiently annihilated by these terms, it was demanded that the court of wards should be abolished; that all the considerable officers of the crown, and all the judges, should be appointed by parliament; and that the right of peace and war should not be exercised without consent of parliament. A little before the commencement of this fruitless treaty, the parliament, to show their determined resolution to proceed in the same haughty imperious method in which they had begun, brought to

the block archbishop Laud, who had long been a prisoner in the tower, and was incapable of giving offence to any.

Britain.
136
Execution of Laud.

While the king's affairs thus went into decay in England, they seemed to revive a little in Scotland, thro' the conduct and valour of the earl of Montrose, a young nobleman newly returned from his travels. He had been introduced to the king; but not meeting with an agreeable reception, had gone over to the covenanters, and been active in forwarding all their violence. Being commissioned, however, by the tables, to wait upon the king while the army lay at Berwick, he was so gained by the civilities and caresses of that monarch, that he thenceforth devoted himself entirely, though secretly, to his service. For attempting to form an association in favour of the royal cause, Montrose was quickly thrown into prison; but being again released, he found the king ready to give ear to his counsels, which were of the boldest and most daring kind. Though the whole nation of Scotland was occupied by the covenanters, though great armies were kept on foot by them, and every place guarded by a vigilant administration, he undertook by his own credit, and that of the few friends who remained to the king, to raise such commotions, as would soon oblige those malcontents to recal the forces which had so sensibly thrown the balance in the favour of parliament. The defeat at Marston-moor had left him no hopes of any succours from England; he was therefore obliged to stipulate with the earl of Antrim, a nobleman of Ireland, for some supply of men from that country. And he himself having used various disguises, and passed through many dangers, arrived in Scotland, where he lay for some time concealed in the borders of the Highlands.

137
Exploits of the earl of Montrose in Scotland.

The Irish did not exceed 1100 foot, very ill armed. Montrose immediately put himself at their head; and, being joined by 1300 Highlanders, attacked lord Elcho, who lay at Perth with 6000 men, utterly defeated him, and killed 2000 of the covenanters. He next marched northwards, in order to rouse again the marquis of Huntly and the Gordons, who had taken arms before, but been suppressed by the covenanters. At Aberdeen he attacked and entirely defeated lord Burley, who commanded 2500 men. Montrose, however, by this victory, did not obtain the end he proposed; the marquis of Huntly showed no inclination to join an army where he was so much eclipsed by the general.

Montrose was now in a very dangerous situation. Argyle, reinforced by the earl of Lothian, was behind him with a great army. The militia of the northern counties, Murray, Rois, and Caithness, to the number of 5000, opposed him in front, and guarded the banks of the Spey, a deep and rapid river. In order to save his troops, he turned aside into the hills; and after some marches and counter-marches, Argyle came up with him at Faivy cattle; and here, after some skirmishes, in which he was always victorious, Montrose got clear of a superior army, and by a quick march through these almost inaccessible mountains put himself absolutely beyond their power.

It was the misfortune of this general, that very good or very ill fortune were equally destructive of his army. After every victory his Scots soldiers went home to en-

Britain.

joy the spoil they had acquired; and had his army been composed of these only, he must have soon been abandoned altogether: but his Irishmen having no place to which they could retire, adhered to him in every fortune. With these, therefore, and some reinforcements of the Atholmen and Macdonalds, Montrose fell suddenly upon Argyle's country, letting loose upon it all the horrors of war. Argyle, collecting 3000 men, marched in quest of the enemy, who had retired with their plunder; and he lay at Innerlochy, supposing himself to be still at a good distance from them. The earl of Seaforth, at the head of the garrison of Inverness, and a body of 500 new-levied troops, pressed the royalists on the other side, and threatened them with total destruction. By a quick and unexpected march, Montrose hastened to Innerlochy, and presented himself in order of battle before the covenanters. Argyle alone, seized with a panic, deserted his army. They made a vigorous resistance, however; but were at last defeated and pursued with great slaughter: after which, Montrose was joined by great numbers of Highlanders; Seaforth's army dispersed of itself; and the lord Gordon, eldest son to the marquis of Huntly, having escaped from his uncle Argyle, who had hitherto detained him, now joined Montrose with a considerable number of his followers, attended by the earl of Aboynne.

The council at Edinburgh, alarmed at these victories, sent for Baillie, an officer of reputation, from England; and, joining him in command with Urey, sent them with a considerable army against the royalists. Montrose, with a detachment of 800 men, had attacked Dundee, a town extremely attached to the covenant; and having carried it by assault, had given it up to be plundered by his soldiers; when Baillie and Urey with their whole force came upon him. He instantly called off his soldiers from the plunder; put them in order; secured his retreat by the most skilful measures; and having marched 60 miles in the face of an enemy much superior, without stopping, or allowing his soldiers the least sleep or refreshment, at last secured himself in the mountains. His antagonists now divided their forces, in order to carry on the war against an enemy who surprised them as much by the rapidity of his marches as by the boldness of his enterprizes. Urey met him with 4000 men, at Alderne near Inverness; and trusting to his superiority in numbers (for Montrose had only 2000 men), attacked him in the post which he had chosen. Montrose, having placed his right wing in strong ground, drew the best of his forces to the other, and left no main body between them; a defect which he artfully concealed by showing a few men through trees and bushes with which that ground was covered. That Urey might have no leisure to perceive the stratagem, he instantly led his wing to the charge, made a furious attack on the covenanters, drove them off the field, and obtained a complete victory over them. Baillie now advanced, in order to revenge Urey's defeat; but he himself met with a like fate at Alford. Montrose, weak in cavalry, lined his troops of horse with infantry; and, after putting the enemy's horse to rout, fell with united force upon their foot, which were entirely cut in pieces, though with the loss of the gallant lord Gordon on the part of the royalists. — Having thus prevailed in so many battles, which his vigour always rendered as decisive as they were success-

ful, he prepared for marching into the southern provinces, in order to put a total period to the power of the covenanters, and dissipate the parliament, which with great pomp and solemnity they had ordered to meet at St Johnstone's.

While Montrose was thus signalizing his valour in the north, Fairfax, or rather Oliver Cromwell under his name, employed himself in bringing in a *new model* into the parliamentary army, and throwing the whole troops into a different shape; and never surely was a more singular army established, than that which was now set on foot by the parliament. To the greatest number of the regiments chaplains were not appointed. The officers assumed the spiritual duty, and united it with their military functions. During the intervals of action they occupied themselves in sermons, prayers, and exhortations. Rapturous ecstasies supplied the place of study and reflection; and while the zealous devotees poured out their thoughts in unpremeditated harangues, they mistook that eloquence, which to their own surprise, as well as that of others, flowed in upon them, for divine illuminations, and effluves of the Holy Spirit. Wherever they were quartered, they excluded the minister from his pulpit; and, usurping his place, conveyed their sentiments to the audience with all the authority that followed their power, their valour, and their military exploits, united to their apparent zeal and fervour. The private soldiers were seized with the same spirit; and in short, such an enthusiasm seized the whole army as was perhaps scarce ever equalled.

The royalists ridiculed this fanaticism of the parliamentary armies, without being sensible how much reason they had to dread it. They were at this time equal, if not superior, in numbers to their enemies; but so licentious, that they were become more formidable to their friends than their enemies. The commanders were most of them men of dissolute characters; in the west especially, where Goring commanded, universal spoil and havoc were committed; and the whole country was laid waste by the rapine of the army; so that the most devoted friends both to the church and state wished there for such success to the parliamentary forces as might put an end to these disorders.

The natural consequence of such enthusiasm in the parliamentary army, and licentiousness in that of the king, was, that equal numbers of the latter would no longer maintain their ground against the former. This appeared in the decisive battle of Naseby, where the forces were nearly equal; but after an obstinate engagement, Charles was entirely defeated, 5000 of his officers and 14000 private men made prisoners, all his artillery and ammunition taken, and his infantry totally dispersed; so that scarce any victory could be more complete.

After this fatal battle, the king retired first to Hereford, then to Abingenny; and remained some time in Wales, from the vain hope of raising a body of infantry in these quarters already harassed and exhausted. His affairs now, however, went to ruin in all quarters. Fairfax retook Leicester on the 17th of June. On the 10th of July, he raised the siege of Taunton; and the royalists retired to Lampoot, an open town in the county of Somerset. Here they were attacked by Fairfax, and beat from their post, with the loss of 300 killed and 1400 taken prisoners. This was followed by

^{34th Jan.} the loss of Bridgewater, which Fairfax took three days after; making the garrison, to the number of 2600 men, prisoners of war. He then reduced Bath and Sharburn; and on the 11th of September Bristol was surrendered to him by prince Rupert, though a few days before he had boasted in a letter to Charles, that he would defend the place for four months. This so enraged the king, that he immediately recalled all the prince's commissions, and sent him a pass to go beyond sea.

¹⁴¹
Bristol taken.

The Scots in the mean time, having made themselves masters of Carlisle after an obstinate siege, marched southwards and invested Hereford; but were obliged to raise the siege on the king's approach. And this was the last glimpse of success that attended his arms. Having marched to the relief of Chester, which was anew besieged by the parliamentary forces under colonel Jones, his rear was attacked by Pointz, and an engagement immediately ensued. While the fight was continued with great obstinacy, and victory seemed to incline to the royalists, Jones fell upon them from the other side, and defeated them with the loss of 600 killed and 1000 taken prisoners. The king with the remains of his army fled to Newark; and from thence escaped to Oxford, where he shut himself up during the winter season.

¹⁴²
Charles retreats to Oxford.

After the surrender of Bristol, Fairfax and Cromwell having divided their forces, the former marched westwards in order to complete the conquest of Devonshire and Cornwall; the latter attacked the king's garrisons which lay the east of Bristol. Nothing was able to stand before these victorious generals; every town was obliged to submit, and every body of troops that pretended to resist were utterly defeated. At last, news arrived, that Montrose himself, after some more successes, was defeated; and thus the only hope of the royal party was destroyed.

¹⁴³
Montrose defeated.

When that brave general descended into the southern counties, the covenanters, assembling their whole force, met him with a numerous army, and gave him battle at Killisyth. Here he obtained his most memorable victory: 6000 of the covenanters were killed on the spot, and no remains of an army left them in Scotland. Many noblemen, who secretly favoured the royal cause, now declared openly for it, when they saw a force able to support them. The marquis of Douglas, the earls of Annandale and Hartfield, the Lords Fleming, Seton, Maderty, Carnegy, with many others, flocked to the royal standard. Edinburgh opened its gates, and gave liberty to all the prisoners there detained by the covenanters. Among the rest was lord Ogilvy, son to Airlie, whose family had contributed very much to the victory gained at Killisyth.—David Lesly was detached from the army in England, and marched to the relief of his distressed party in Scotland. Montrose advanced still further to the south, allured by the vain hopes, both of rousing to arms the earls of Hume, Traquaire, and Roxborough, who had promised to join him; and of obtaining from England some supply of cavalry, in which he was very deficient. By the negligence of his scouts, Lesly, at Philip-haugh in the forest, surprized his army, much diminished in numbers from the desertion of the Highlanders, who had retired to the hills, according to custom, to secure their plunder. After a sharp conflict, in which Montrose exerted great valour,

N^o 55.

his forces were routed by Lesly's cavalry, and he himself forced to fly to the mountains.

Britain.

Nothing could be more affecting than the situation in which the king now was. He now resolved to grant the parliament their own terms, and sent them repeated messages to this purpose, but they never deigned to make him the least reply. At last, after reproaching him with the blood spilt during the war, they told him that they were preparing some bills, to which, if he would consent, they would then be able to judge of his pacific inclinations. Fairfax, in the mean time, was advancing with a victorious army in order to lay siege to Oxford; and Charles, rather than submit to be taken captive and led in triumph by his insolent subjects, resolved to give himself up to the Scots, who had never testified such implacable animosity against him, and to trust to their loyalty for the rest. After passing through many bye-ways and cross-roads, he arrived in company with only two persons, Dr Hudson and Mr Ashburnham, at the Scots camp before Newark, and discovered himself to lord Leven their general.

¹⁴⁴
Charles surrenders himself to the Scots.

The reception he met with was such as might be expected from these infatuated bigots, destitute of every principle of reason, honour, or humanity. Instead of endeavouring to alleviate the distresses of their sovereign, they suffered him to be insulted by the clergymen. They immediately sent an account of his arrival to the English parliament, and they as quickly entered into a treaty with the Scots about delivering up their prisoner. The Scots thought this a proper time for the recovery of their arrears due to them by the English. A great deal was really due them, and they claimed much more than actually belonged to them. At last, after various debates between them and the parliament, in which they pretended to great honour, and insisted upon many punctilios, it was agreed, that, upon payment of £.400,000, the Scots should deliver up the king to his enemies; and this was cheerfully complied with. Thus the Scots jolly fell under the censure of having sold their king who had thrown himself upon their mercy; a stain peculiar to the nation, and unparalleled in history either ancient or modern. It must, however, be acknowledged, that the infamy of this bargain had such an influence on the Scots parliament, that they once voted that the king should be protected and his liberty insisted on. But the general assembly interposed; and pronounced, that as he had refused to take the covenant which was pressed on him, it became not the godly to concern themselves about his fortunes. In consequence of this, the parliament were obliged to retract their vote. The king, being delivered over to the English commissioners, was conducted under a guard to Holdenby in the county of Northampton, where he was very rigorously confined; his ancient servants being dismissed, himself debarred from visits, and all communication cut off with his friends or family.

¹⁴⁶

The civil war being now over, the king absolved his followers from their allegiance, and the parliament had now no enemy to fear but their own troops. From this quarter their danger only arose; and it was not long before they found themselves in the same unfortunate situation to which they had reduced the king. The majority of the house were Presbyterians, but the majority of the army were independents. The former, soon after the retreat of the Scots, seeing every thing reduced

The army begin to usurp the sovereign power.

Britain. reduced to obedience, proposed to disband a considerable part of the army, and send the rest over to Ireland. This was by no means relished, and Cromwell took care to heighten the disaffection. Instead of preparing to disband, therefore, the soldiers resolved to petition; and they began by desiring an indemnity, ratified by the king, for any illegal actions which they might have committed during the war. The commons voted that this petition tended to introduce mutiny, &c. and threatened to proceed against the promoters of it as enemies to the state and disturbers of the public peace. The army now began to set up for themselves. In opposition to the parliament at Westminster, a military parliament was formed. The principal officers formed a council to represent the body of peers; the soldiers elected two men out of each company to represent the commons, and these were called the *agitators of the army*; and of this assembly Cromwell took care to be a member. The new parliament soon found many grievances to be redressed; and specified some of the most considerable. The commons were obliged to yield to every request, and the demands of the agitators rose in proportion. The commons accused the army of mutiny and sedition; the army retorted the charge, and alleged that the king had been deposed only to make way for their usurpations. Cromwell, in the mean time, who secretly conducted all the measures of the army, while he exclaimed against their violence, resolved to seize the king's person. Accordingly a party of 500 horse appeared at Holmby castle, under the command of one Joyce, originally a taylor, but now a cornet; and by this man was the king conducted to the army, who were hastening to their rendezvous at Tripbo-beath near Cambridge. Next day Cromwell arrived among them, where he was received with acclamations of joy, and immediately invested with the supreme command.

The commons now saw the designs of the army; but it was too late, all resistance was become vain: Cromwell advanced with precipitation, and was in a few days at St Alban's. Even submission was now to no purpose; the army still rose in their demands, in proportion as these demands were gratified, till at last they claimed a right of modelling the whole government, and settling the nation.

Cromwell began with accusing eleven members of the house, the very leaders of the presbyterian party, as guilty of high treason, and being enemies of the army. The commons were willing to protect them; but the army insisting on their dismissal, they voluntarily left the house. At last the citizens of London, finding the constitution totally overturned, and a military despotism beginning to take place, instead of the kingly one they were formerly afraid of, began to think seriously of repressing the insolence of the troops. The common council assembled the militia of the city; the works were manned; and a manifesto published, aggravating the hostile intentions of the army. Finding that the commons, in compliance with the request of the army, had voted that the city-militia should be disbanded, the multitude rose, besieged the door of the house, and obliged them to reverse that vote they had so lately passed. The assembly was, of consequence, divided into two parties; the greater part siding with the citizens; but the minority, with the two speakers at their head,

were for encouraging the army. Accordingly the two speakers, with 62 of the members, secretly retired from the house, and threw themselves under the protection of the army, who were then at Hounslow-heath. They were received with shouts and acclamations; their integrity was extolled; and the whole force of the soldiery, to the number of 20,000 men, now moved forward to reinstate them in their places.

In the mean time, the part of the house which was left, resolved to resist the encroachments of the army. They chose new speakers, gave orders for enlisting troops, ordered the train-bands to man the lines; and the whole city boldly resolved to resist the invasion. But this resolution only held while the enemy was at a distance; for when Cromwell appeared, all was obedience and submission: the gates were opened to the general, who attended the two speakers and the rest of the members peaceably to their habitations. The eleven impeached members being accused as causes of the tumult, were expelled; and most of them retired to the continent. The mayor, sheriff, and three aldermen, were sent to the tower; several citizens, and officers of the militia, were committed to prison; the lines about the city levelled with the ground; and the command of the Tower was given to Fairfax.

It now only remained to dispose of the king, who remained a prisoner at Hampton-court. The independent army, at the head of whom was Cromwell, on one hand; and the presbyterians, in name of both houses, on the other; treated with him separately in private. He had sometimes even hopes, that, in their struggles for power, he might have been chosen mediator in the dispute; and he expected that the kingdom at last, being sensible of the miseries of anarchy, would of its own accord be hushed into its former tranquil condition. At this time he was treated with some flattering marks of distinction; he was permitted to converse with his old servants; his chaplains were permitted to attend him, and celebrate divine service their own way. But the most exquisite pleasure he enjoyed was in the company of his children, with whom he had several interviews. The meeting on these occasions was so pathetic, that Cromwell himself, who was once present, could not help being moved, and was heard to declare, that he never beheld such an affecting scene before. But these instances of respect were of no long continuance. As soon as the army had gained a complete victory over the house of commons, the king was treated not only with the greatest disrespect, but even kept in continual alarms for his own personal safety. The consequence of this was, that Charles at last resolved to withdraw himself from the kingdom. Accordingly, on the 11th of November 1647, attended only by Sir John Berkeley, Alburnham, and Legg, he privately left Hampton court; and his escape was not discovered till near an hour after; when those who entered his chamber, found on the table some letters directed to the parliament, to the general, and to the officer who had attended him. All night he travelled through the forest, and arrived next day at Titchfield, a seat of the earl of Southampton, where resided the court's dowager, a woman of honour, to whom the king knew he might safely entrust his person. Before he arrived at this place, he had gone to the sea-coast; and expressed great

Britain.

anxiety that a ship which he seemed to look for had not arrived. He could not hope to remain long concealed at Tichfield: the question was, what measure should next be embraced? In the neighbourhood lay the Isle of Wight, of which Hammond was governor. This man was entirely dependent on Cromwell, which was a very unfavourable circumstance: yet, because the governor was nephew to Dr Hammond the king's favourite chaplain, and had acquired a good reputation in the army, it was thought proper to have recourse to him in the present exigence, when no other rational expedient could be thought of. Ashburnham and Berkeley were dispatched to the island. They had orders not to inform Hammond of the place where the king lay concealed, till they had first obtained a promise of him not to deliver up his majesty, even though the parliament and army should require him; but restore him to his liberty, if he could not protect him. The promise would have been but a slender security: yet even without exacting it, Ashburnham imprudently, if not treacherously, brought Hammond to Tichfield; and the king was obliged to put himself into his hands, and to attend him to Carisbroke castle in the Isle of Wight, where, though he was received with great demonstrations of respect and kindness, he was in reality a prisoner.

153
Cromwell in danger from the levellers.

While the king continued in this forlorn situation, Cromwell found himself upon the point of losing all the fruits of his former schemes, by having his own principles turned against himself. Among the Independents, who in general were for no ecclesiastical subordination, a set of men grew up called *levellers*, who disallowed all subordination whatsoever, and declared that they would have no other chaplain, king, or general, but Jesus Christ. Though this would have gone down very well with Cromwell as long as it was only directed against his enemies, he did not so well relish it when applied to himself. Having intimation that the levellers were to meet at a certain place, he unexpectedly appeared before them at the head of his red regiment, which had hitherto been deemed invincible. He demanded, in the name of God, what these meetings and murmurings meant; he expostulated with them upon the danger and consequence of their precipitant schemes, and desired them immediately to depart. Instead of obeying, however, they returned an insolent answer; wherefore, rushing on them in a fury, he laid two of them dead at his feet. His guards dispersing the rest, he caused several of them to be hanged upon the spot, and sent others to London; and thus dissipated a faction no otherwise criminal than in having followed his own example.

154
Cromwell defeats the Scots.

Cromwell's authority was greatly increased by the last mentioned action; but it became irresistible in consequence of a new and unexpected addition to his successes. The Scots, perhaps ashamed of the reproach of having sold their king, and stimulated farther by the Independents, who took all occasions to mortify them, raised an army in his favour, and the chief command was given to the earl of Hamilton: while Langdale, who professed himself at the head of the more bigotted party who had taken the covenant, marched at the head of his separate body, and both invaded the north of England. Though these two armies amounted to above 20,000 men, yet Cromwell, at the head of 8000

Britain.

of his hardy veterans, feared not to give them battle. He attacked them one after another; routed and dispersed them; took Hamilton prisoner; and, following his blow, entered Scotland, the government of which he settled entirely to his satisfaction. An insurrection in Kent was quelled by Fairfax with the same ease; and nothing but success attended all this usurper's attempts.

During these contentions, the king, who was kept a prisoner at Carisbroke castle, continued to negotiate with the parliament for settling the unspeakable calamities of the kingdom. The parliament now saw no other method of destroying the military power, but to depress it by the kingly. Frequent proposals for an accommodation passed between the captive king and the commons; but the great obstacle which had all along stood in the way, still kept them from agreeing. This was the king's refusing to abolish episcopacy, though he consented to alter the liturgy. However, the treaty was still carried on with vigour, and the parliament for the first time seemed in earnest to conclude their negotiations. But all was now too late. The victorious army, with Cromwell at their head, advanced to Windsor, and with furious remonstrances began to demand vengeance on the king. The unhappy monarch had been lately sent under confinement to that place; and from thence he was now conveyed to Hurst-castle in Hampshire, opposite to the Isle of Wight. The parliament in the mean time began to issue ordinances for a more effectual opposition to these military encroachments, when they were astonished by a message from Cromwell, that he intended paying them a visit next day with his whole army; and in the mean time ordering them to raise him L.40,000 on the city of London.

155
Negotiation between the king and parliament.

The commons, though destitute of all hopes of prevailing, had still the courage to resist, and to attempt in the face of the whole army to finish the treaty they had begun with the king. They had taken into consideration the whole of his concessions; and though they had formerly voted them unsatisfactory, they now renewed the consultation with great vigour. After a violent debate which lasted three days, it was carried in the king's favour by a majority of 129 against 83, that his concessions were a foundation for the houses to proceed upon in settling the affairs of the nation. This was the last attempt in his favour; for the next day colonel Pride, at the head of two regiments, blockaded the house; and seizing in the passage 41 members of the presbyterian party, sent them to a low room belonging to the house, that passed by the denomination of *Hell*. Above 160 members more were excluded; and none were allowed to enter but the most furious and determined of the Independents, in all not exceeding 60. This atrocious invasion of parliamentary rights commonly passed by the name of *Pride's purge*, and the remaining members were called the *Rump*. These soon voted, that the transactions of the house a few days before were entirely illegal, and that their general's conduct was just and necessary.

156
Colonel Pride's purge.

Nothing now remained, to complete the wickedness of this parliament, but to murder the king. In this assembly, therefore, composed of the most obscure citizens, and officers of the army, a committee was appointed to bring in a charge against the king; and

157
Charge against the king brought in.

tain. on their report, a vote passed declaring it treason in a king to levy war against his parliament. It was therefore resolved, that an high court of justice should be appointed, to try his majesty for this new invented treason. For form's sake, they desired the concurrence of the few remaining lords in the upper house; but there was virtue enough left in that body unanimously to reject the proposal. The commons, however, were not to be stopped by so small an obstacle. They voted that the concurrence of the house of lords was unnecessary, and that the people were the origin of all just power. To add to their zeal, a woman of Herefordshire, illuminated by prophetic visions, desired admittance, and communicated a revelation she pretended to have received from heaven. She assured them that their measures were consecrated from above, and ratified by the sanction of the Holy Ghost. This intelligence gave them great comfort, and much confirmed them in their present resolutions.

Colonel Harrison, the son of a butcher, was commanded to conduct the king from Hurst-castle to Windsor, and from thence to London. His afflicted subjects, who ran to have a sight of their sovereign, were greatly affected at the change that appeared in his face and person. He had permitted his beard to grow; his hair was become venerably grey, rather by the pressure of anxiety than the hand of time; while the rest of his apparel bore the marks of misfortune and decay. He had long been attended by an old decrepid servant whose name was *Sir Philip Warwick*, who could only deplore his master's fate without being able to revenge his cause. All the exterior symbols of sovereignty were now withdrawn, and his attendants had orders to serve him without ceremony. He could not, however, be persuaded that his adversaries would bring him to a formal trial; but he every moment expected to be dispatched by private assassination.

From the 6th to the 24th of January was spent in making preparations for this extraordinary trial. The court of justice consisted of 133 persons named by the commons; but of these never above 70 met upon the trial. The members were chiefly composed of the principal officers of the army, most of them of very mean birth, together with some of the lower house, and a few citizens of London. Bradshaw a lawyer was chosen president; Coke was appointed solicitor for the people of England; Donnellus, Steele, and Atke, were named assistants. The court sat in Westminster-hall. When the king was brought forward before the court, he was conducted by the mace-bearer to a chair placed within the bar. Though long detained a prisoner, and now produced as a criminal, he still maintained the dignity of a king. His charge was then read by the solicitor, accusing him of having been the cause of all the bloodshed which followed since the commencement of the war; after which Bradshaw directed his discourse to him, and told him that the court expected his answer.

The king began his defence with declining the authority of the court. He represented, that having been engaged in treaty with his two houses of parliament, and having finished almost every article, he expected a different treatment from what he had now received. He perceived, he said, no appearance of an upper house, which was necessary to constitute a just tribunal. He alleged that he was himself the king and

fountain of law, and consequently could not be tried by laws to which he had never given his assent; that having been intrusted with the liberties of the people, he would not now betray them by recognizing a power founded in usurpation; that he was willing, before a proper tribunal, to enter into the particulars of his defence; but that before them he must decline any apology for his innocence, lest he should be considered as the betrayer of, and not a martyr for, the constitution. Bradshaw, in order to support the authority of the court, insisted, that they had received their authority from the people, the source of all right. He pressed the king not to decline the authority of the court that was delegated by the commons of England, and interrupted and over-ruled him in his attempts to reply. In this manner the king was three times produced before the court, and as often persisted in declining its jurisdiction. The fourth and last time he was brought before this self-created tribunal, as he was proceeding thither, he was insulted by the soldiers and the mob, who cried out, "Justice! justice! Execution! execution!" but he continued undaunted. His judges having now examined some witnesses, by whom it was proved that the king had appeared in arms against the forces commissioned by parliament, they pronounced sentence against him. He seemed very anxious at this time to be admitted to a conference with the two houses, and it was supposed that he intended to resign the crown to his son; but the court refused compliance, and considered his request as an artifice to delay justice.

The behaviour of Charles under all these instances of low-bred malice was great, firm, and equal. In going through the hall from this execrable tribunal, the soldiers and rabble were again instigated to cry out, Justice and execution! They reviled him with the most bitter reproaches. Among other insults, one miscreant presumed to spit in the face of his sovereign. He patiently bore their intolence: "Poor souls (cried he), they would treat their generals in the same manner for sixpence." Those of the populace who still retained the feelings of humanity expressed their sorrow in sighs and tears. A soldier more compassionate than the rest could not help imploring a blessing on his royal head. An officer overhearing him, struck the honest centinel to the ground before the king; who could not help saying, that the punishment exceeded the offence.

At his return to Whitehall, Charles desired permission of the house to see his children, and to be attended in his private devotions by Dr Juxon late bishop of London. These requests were granted, and also three days to prepare for execution. Every night between his sentence and execution, the king slept sound as usual, though the noise of the workmen employed in framing the scaffold continually resounded in his ears. The fatal morning being at last arrived, he rose early; and calling one of his attendants, he had him employ more than usual care in dressing him, and preparing him for so great a solemnity. The three before Whitehall was the place destined for his execution; for it was intended that this should increase the severity of his punishment. He was led through the banqueting-house to the scaffold adjoining to that edifice, attended by his royal and fervent bishop Juxon, a man of the true mild and steady virtues with his master. The scaffold, which was

Britain.

159 He is not held by the soldiers.

Britain.

covered with black, was guarded by a regiment of soldiers under the command of colonel Tomlinson; and on it were to be seen the block, the ax, and two executioners in masks. The people, in crowds, stood at a greater distance. The king surveyed all these solemn preparations with calm composure; and, as he could not expect to be heard by the people at a distance, he addressed himself to the few persons who stood round him. He there justified his own innocence in the late fatal wars: he observed, that he had not taken arms till after the parliament had shown him the example; and that he had no other object in his warlike preparations, than to preserve that authority entire which had been transmitted to him by his ancestors. But, though innocent towards his people, he acknowledged the equity of his execution in the eyes of his Maker: he owned that he was justly punished for having consented to the execution of an unjust sentence against the earl of Strafford. He forgave all his enemies; exhorted the people to return to their obedience, and acknowledge his son as his successor; and signified his attachment to the Protestant religion as professed by the church of England. So strong was the impression made by his dying words on those who could hear him, that colonel Tomlinson himself, to whose care he had been committed, acknowledged himself a convert. At one blow his head was severed from his body. The other executioner then, holding up the head, exclaimed, "This is the head of a traitor."

161
Grief of the nation on that account.

It is impossible to describe the grief, indignation, and astonishment, which took place not only among the spectators, who were overwhelmed with a flood of sorrow, but throughout the whole nation, as soon as the report of this fatal execution was conveyed to them. Each blamed himself either with active disloyalty to the king, or a passive compliance with his destroyers. The very pulpits that used to resound with insolence and sedition were now bedewed with tears of unfeigned repentance; and all united in their detestation of those dark hypocrites who, to satisfy their own enmity, involved a whole nation in the guilt of treason.—Charles was executed on the 30th of January 1649, in the 49th year of his age, and 24th of his reign. He was of a middling stature, robust, and well-proportioned. His visage was pleasant, but melancholy; and it is probable that the continual troubles in which he was involved might have made that impression on his countenance.

162
Piety of the king in his last moments.

It being remarked, that the king, the moment before he stretched out his neck to the executioner, had said to Juxon, with a very earnest accent, the single word REMEMBER, great mysteries were supposed to be concealed under that word; and the generals vehemently insisted with the prelate that he should inform them of the king's meaning. Juxon told them, that the king, having frequently charged him to inculcate on his son the forgiveness of his murderers, had taken this opportunity in the last moment of his life, when his commands, he supposed, would be regarded as sacred and inviolable, to reiterate that desire; and that his mild spirit thus terminated its present course by an act of benevolence to his greatest enemies.

163
Dissolution of the English monarchy.

The dissolution of the monarchy in England soon followed the death of the monarch. When the peers met on the day appointed in their adjournment, they

entered upon business; and sent down some votes to the commons, of which the latter deigned not to take the least notice. In a few days after, the commons voted, that the house of lords was useless and dangerous; for which reason it was abolished. They voted it high treason to acknowledge Charles Stuart, son of the late king, as successor to the throne. A great seal was made: on one side of which were engraven the arms of England and Ireland, with this inscription, "The great seal of England." On the reverse was represented the house of commons sitting, with this motto: "On the first year of freedom, by God's blessing restored, 1649." The forms of all public business were changed from being transacted in the king's name, to that of the *keepers of the liberties of England*. The court of king's bench was called the court of *public bench*. Nay, so cautious on this head, it is said, were some of the republicans, that, in reciting the Lord's prayer, they would not say, "thy kingdom," but "thy *commonwealth*, come." The king's statue in the exchange was thrown down; and on the pedestal these words were inscribed: *Exit tyrannus, regum ultimus*; "The tyrant is gone, the last of the kings." The commons, it is said, intended to bind the princess Elizabeth apprentice to a button-maker; the duke of Gloucester was to be taught some other mechanical employment: but the former soon died of grief, as is supposed, for her father's tragical end; the latter was sent beyond sea by Cromwell.

164
Enthusiasm and tyranny of the republicans.

The commons next proceeded to punish those who had been most remarkable for their attachment to their late sovereign. The duke of Hamilton, lord Capel, and the earl of Holland, were condemned and executed; the earl of Norwich and Sir John Owen were also condemned, and afterwards pardoned. These executions irritated the Scots: their loyalty began to return; and the insolence of the independents, with their victories, inflamed them still more. They determined, therefore, to acknowledge prince Charles for their king, but at the same time to abridge his power by every limitation which they had attempted to impose on his father.

Charles, after the death of his father, having passed some time at Paris, and finding no likelihood of assistance from that quarter, was glad to accept of any conditions. The Scots, however, while they were thus professing loyalty to their king, were nevertheless cruelly punishing his adherents. Among others, the brave marquis of Montrose was taken prisoner, as he endeavoured to raise the Highlanders in the royal cause; and being brought to Edinburgh, was hanged on a gibbet 30 feet high, then quartered, and his limbs stuck up in the principal towns of the kingdom. Yet, notwithstanding all this severity, Charles ventured into Scotland, and had the mortification to enter the gate of Edinburgh where the limbs of that faithful adherent were still exposed.

165
Charles II. invited into Scotland.

The young king soon found that he had only exchanged his exile for imprisonment. He was surrounded and incessantly importuned by the fanatical clergymen, who having brought royalty under their feet, were resolved to keep it still subservient, and to trample upon it with all the contumely of upstarts. Charles pretended to give ear to their discourses; but, however, made an attempt

166
His hard usage there.

Britain. attempt to escape. He was overtaken and brought back; when he owned the greatness of his fault, and testified his repentance for what he had done. Cromwell, in the mean time, who had been appointed by the parliament to command the army in Ireland, prosecuted the war in that kingdom with his usual success. He had to encounter the royalists commanded by the duke of Ormond, and the native Irish led on by O'Neal. These troops he quickly overcame; and most of the towns, intimidated by his cruelty, opened their gates at his approach. He was on the point of reducing the whole kingdom, when he was recalled by the parliament to defend his country against the Scots, who had raised a considerable army in support of the royal cause.

167
Cromwell's
success in
Ireland.

168
On the return
of Cromwell to
England, he was
chosen
commander in
chief of the
parliamentary
forces, in
the room of
Fairfax, who
declined
opposing the
presbyterians.
The new
general
immediately
set forward
for Scotland
with an army
of 16,000 men,
where he
was opposed
by general
Lefly, who
formed an
excellent
plan for his
own defence.
This prudent
commander,
knowing his
men to be
inferior in
valour and
discipline,
however
superior in
numbers, to
those of
Cromwell,
kept him-
self
carefully
in his
intrenchments.
At last
Cromwell
was drawn
into a very
disadvan-
tageous
post near
Dunbar, where
his antagonist
waited
deliberately
to take
advantage
of him. From
this im-
minent
danger,
however,
he was
delivered
by the
madness
of the
Scots
clergy. They,
it seems,
had been
wrestling
in prayer
with the
Lord
night
and
day, and
at last
fancied
that they
had obtained
the
superiority.
Revelations
were made
them, that
the
heretical
army,
together
with
Agag
their
general,
would
be
delivered
into
their
hand. Upon
the
assurance
of these
visions,
they
obliged
their
general
to descend
into
the
plain, and
give
the
English
battle. When
Cromwell
saw this
mad
action,
he
assured
his
followers,
that
the
Lord
had
delivered
them
into
his
hands,
and
ordered
his
army
to sing
psalms,
as if
already
certain
of
victory.
The
Scots,
though
double
the
number
of the
English,
were
soon
put
to
flight,
and
perished
with
great
slaughter,
while
Cromwell
did
not
lose
in
all
above
40
men.

169
They are
defeated
by
Cromwell.

After this defeat, Charles put himself at the head of the remains of his army; and these he further strengthened by the royalists, who had been for some time excluded from his service by the covenanters. He was so closely pursued by Cromwell, however, that he soon found it impossible to maintain his army. Observing, therefore, that the way was open to England, he immediately directed his march towards that country, where he expected to be reinforced by all the royalists in that part of the kingdom. In this, however, he was deceived: the English, terrified at the name of his opponent, dreaded to join him. But his mortification was greatly increased, when at Worcester he was informed, that Cromwell was marching with hasty strides from Scotland with an army of 40,000 men. This news was scarcely arrived, when Cromwell himself was there. He fell upon the town on all sides: the whole Scots army was either killed or taken prisoners; and the king himself, having given many proofs of personal valour, was obliged to fly.

The young king now entered upon a scene of ad-

ventures the most romantic that can be imagined. After his hair was cut off, the better to disguise his person, he worked for some days in the habit of a peasant, cutting faggots in a wood. He next made an attempt to retire into Wales, under the conduct of one Pendred, a poor farmer, who was sincerely attached to his cause. In this attempt, however, he was disappointed; every pass being guarded to prevent their escape. Being obliged to return, he met one colonel Careless, who had escaped the carnage at Worcester. In his company the king was obliged to climb a spreading oak; among the thick branches of which they spent the day together, while they heard the soldiers of the enemy in pursuit of them below. From thence he passed with imminent danger, feeling all the varieties of famine, fatigue, and pain, till he arrived at the house of colonel Lane, a zealous royalist in Staffordshire. There he deliberated about the means of escaping into France: and Bristol being supposed the proper port, it was resolved that he should ride thither before this gentleman's sister, on a visit to one Mrs Norton, who lived in the neighbourhood of that city. During this journey, he every day met with persons whose faces he knew, and at one time passed through a whole regiment of the enemy's army.

When they arrived at Mrs Norton's, the first person they saw was one of his own chaplains sitting at the door, and amusing himself with seeing people play at bowls. The king, after having taken proper care of his horse in the stable, was shown to an apartment which Mrs Lane had provided for him, as it was said he had the ague. The butler, being sent to him with some refreshment, no sooner beheld his face, which was very pale with anxiety and fatigue, than he recollected his king and master; and falling on his knees, while the tears streamed down his cheeks, cried out, "I am rejoiced to see your majesty." The king was alarmed; but made the butler promise that he would keep the secret from every mortal, even from his master; and the honest servant punctually obeyed him.

No ship being found that would for a month set sail from Bristol either for France or Spain, the king was obliged to go elsewhere for a passage. He therefore repaired to the house of colonel Wyndham in Dorsetshire, where he was cordially received. His mother, a venerable matron, seemed to think the end of her life nobly rewarded in having it in her power to give protection to her king. She expressed no dissatisfaction at having lost three sons and one grandchild in the defence of his cause, since she was honoured in being instrumental in his own preservation.

Pursuing from thence his journey to the sea-side, he once more had a very narrow escape at a little inn, where he set up for the night. The day had been appointed for a solemn fast; and a fanatical weaver, who had been a soldier in the parliamentary army, was preaching against the king in a little chapel fronting the house. Charles, to avoid suspicion, was himself among the audience. It happened that a smith, of the same principles with the weaver, had been examining the horses belonging to the passengers, and came to assure the preacher, that he knew by the fashion of the shoes, that one of the strangers' horses came from the north. The preacher immediately affirmed, that this horse could belong to no other than Charles Stuart, and

Britain.
170
Charles de-
clated at
Worcester.

Britain.

and instantly went with a countable to search the inn. But Charles had taken timely precautions, and left the inn before the countable's arrival.

172

He escapes to France.

At Shoreham, in Suffex, a vessel was at last found, in which he embarked. He was known to so many, that if he had not set sail at that critical moment, it had been impossible for him to escape. After 41 days concealment, he arrived safely at Feschamp in Normandy. No less than 40 men and women had at different times been privy to his escape.

173

Cromwell treats Scotland as a conquered province.

Cromwell in the mean time returned in triumph; and his first care was to depress the Scots, on account of their having *withstood the work of the gospel* as he called it. An act was passed for abolishing royalty in Scotland, and annexing that kingdom as a conquered province to the English commonwealth. It was empowered, however, to send some members to the English parliament. Judges were appointed to distribute justice; and the people of that country, now freed from the tyranny of the ecclesiastics, were not much dissatisfied with the government.

174

War with the Dutch.

All parts of the British dominions being now reduced to perfect subjection to the parliament, they next resolved to chastise the Dutch, who had given but very slight causes of complaint. It happened that one Dr Dorilaus, who was of the number of the late king's judges, being sent by the parliament as their envoy to Holland, was assassinated by one of the royal party who had taken refuge there. Some time after, also, Mr St John, appointed their ambassador to that court, was insulted by the friends of the prince of Orange. These were thought sufficient reasons for a declaration of war against the Hollanders by the commonwealth of England. The parliament's chief dependence lay in the activity and courage of Blake their admiral; who, though he had not embarked in naval command till late in life, yet surpassed all that went before him in courage and dexterity. On the other side, the Dutch opposed to him their famous admiral Van Tromp, to whom their country never since produced an equal. Many were the engagements between these celebrated admirals, and various was their success. Several dreadful encounters served rather to show the excellency of the admirals than to determine their superiority. At last the Dutch, who felt many great disadvantages by the loss of their trade, and by the total suspension of their fisheries, were willing to treat of a peace. The parliament, however, gave but a very unfavourable answer. They studied to keep their navy on foot as long as they could; rightly judging, that while the force of the nation was exerted by sea, it would diminish the formidable power of Cromwell by land.

175

Cromwell resolves to seize the sovereignty.

This great aspirer, however, quickly perceived their designs; and therefore, secure in the attachment of the army, resolved to seize the sovereign power. He persuaded the officers to present a petition for payment of arrears, and redress of grievances. His orders were obeyed: a petition was drawn up and presented, in which the officers, after demanding their arrears, desired the parliament to consider how many years they had sat, and what pretensions they had formerly made of their designs to new-model the house, and establish freedom on its broadest basis. They alleged, that it was now full time to give place to others; and however meritorious their actions might have been, yet the rest

Britain.

of the nation had some right, in their turn, to manifest their patriotism in defence of their country. The house was highly offended: they appointed a committee to prepare an act, ordaining that all persons who presented such petitions for the future should be deemed guilty of high treason. To this the officers made a very warm remonstrance, and the parliament as angry a reply. Cromwell, being informed of this altercation, started up in the utmost seeming fury, and turning to major Vernon, cried out, that "he was compelled to do a thing that made the very hair of his head stand on end." Then, halting to the house with 300 soldiers, and with the marks of violent indignation on his countenance, he entered, took his place, and attended to the debates for some time. When the question was ready to be put, he suddenly started up, and began to load the parliament with the vilest reproaches for their tyranny, ambition, oppression, and robbery of the public. Upon which, stamping with his foot, which was the signal for the soldiers to enter, the place was immediately filled with armed men. Then, addressing himself to the members, "For shame (said he), get you gone. Give place to honest men; to those who will more faithfully discharge their trust. You are no longer a parliament; I tell you, you are no longer a parliament; the Lord has done with you." Sir Harry Vane exclaiming against this conduct, "Sir Harry! (cries Cromwell with a loud voice), O Sir Harry Vane! The Lord deliver me from Sir Harry Vane!" Taking hold then of one of the members by his cloak, "Thou art a whoremaster," cries he; to another, "Thou art an adulterer;" to a third, "Thou art a drunkard;" to a fourth, "Thou art a glutton, &c." "It is you (continued he to the members), that have forced me upon this. I have fought the Lord night and day, that he would rather slay me than put me upon this work." Then pointing to the mace, "Take away that bauble," cried he: after which, turning out all the members, and clearing the hall, he ordered the doors to be locked; and putting the keys in his pocket, returned to Whitehall.

176

He turns out the parliament.

Thus the whole civil and military power centered in Cromwell, who by this bold transaction became, in effect, king of Great Britain, with uncontrollable authority. Being willing, however, to amuse the people with the form of a commonwealth, he proposed to give his subjects a parliament; but such an one as should be altogether obedient to his commands. For this purpose it was decreed, that the sovereign power should be vested in 144 persons, under the denomination of a parliament; and he undertook to make the choice himself. The persons pitched upon were the lowest, meanest, and most ignorant among the citizens, and the very dregs of the fanatics. To go further than others in the absurdities of fanaticism was the chief qualification upon which each of these valued himself. Their very names, borrowed from scripture, and rendered ridiculous by their misapplication, served to show their excess of folly. One of them particularly, who was called *Praise God Barebone*, a canting leather-feller, gave his name to this odd assembly, and it was called *Barebone's Parliament*. They were chiefly composed of Antinomians; a sect that, after receiving the spirit, supposed themselves incapable of error; and the fifth-monarchy-men, who every hour expected Christ's

177

And chuses another.

Britain. second coming on earth. They began by choosing eight of their tribe to seek the Lord in prayer, while the rest calmly sat down to deliberate upon the suppression of the clergy, the universities, and courts of justice: and instead of all this, it was their intent to substitute the law of Moses.

178 It was impossible such a legislature as this could stand; even the vulgar began to exclaim against it, and Cromwell himself to be ashamed of their absurdities. He had carefully chosen many persons among them who were entirely devoted to his interests, and these he commanded to dismiss the assembly. These accordingly met by concert earlier than the rest of their fraternity; and observing to each other that this parliament had sat long enough, they hastened to Cromwell, with Rouse their speaker at their head, and into his hands resigned the authority with which he had invested them. Cromwell accepted their resignation with pleasure; but being told that some of their number were refractory, he sent colonel White to clear the house of such as ventured to remain there. They had placed one Moyer in the chair by the time that the colonel had arrived; and he being asked by the colonel, What they did there? Moyer replied very gravely, That they were seeking the Lord. "Then you may go elsewhere (cried White); for, to my certain knowledge, the Lord hath not been here these many years."

179 The shadow of a parliament being thus dissolved, the officers, by their own authority, declared Cromwell protector of the commonwealth of England. The mayor and aldermen were sent for to give solemnity to his appointment, and he was instituted into his new office at Whitehall, in the palace of the kings of England. He was to be addressed by the title of *Highness*; and his power was proclaimed in London, and other parts of the kingdom. It was now, indeed, in a great measure necessary that some person should take the supreme command; for affairs were brought into such a situation, by the furious animosities of the contending parties, that nothing but absolute power could prevent a renewal of former bloodshed and confusion.

180 The government of the kingdom was adjusted in the following manner. A council was appointed, which was not to exceed 21, nor to be under 13 persons. These were to enjoy their offices for life, or during good behaviour; and, in case of a vacancy, the remaining members named three, of whom the protector chose one. The protector was appointed the supreme magistrate of the commonwealth, with such powers as the king was possessed of. The power of the sword was vested in him jointly with the parliament when sitting, or with the council at other times. He was obliged to summon a parliament once every three years, and to allow them to sit five months without adjournment. A standing army was established of 20,000 foot and 10,000 horse; and funds were assigned for their support. The protector enjoyed his office for life; and on his death, his place was to be supplied by the council. Of all these clauses the standing army was sufficient for Cromwell's purpose; for, while possessed of that instrument, he could mould the rest of the constitution to his pleasure at any time. He chose his council from among his officers, who had been the companions of his dangers and victories, to each of whom he assigned a portion of 1000*l.* a-year. He took care to have his troops,

upon whose fidelity he depended for support, paid a month in advance; the magazines were also well provided, and the public treasure managed with frugality and care; while his activity, vigilance, and resolution, were so well exerted, that he discovered every conspiracy against his person, and every plot for an insurrection, before they took effect.

This Cromwell continued to govern, though without assuming the title of *king*, in as absolute a manner as the most despotic prince in Europe. As he was feared at home, so he made himself respected abroad. The Dutch, having been humbled by repeated defeats, were obliged to sue for peace. Cromwell obliged them to pay deference to the British flag. He compelled them to abandon the interests of the king, to pay 85,000*l.* as an indemnification for former expences, and to restore to the English East India company a part of those dominions which they had been dispossessed of by the Dutch during the former reign. The ministry of France thought proper to pay deference to the imperious character of the protector; and he having lent that court a body of 6000 men to attack the Spanish dominions in the Netherlands, who obtained a signal victory, the French put Dunkirk into his hands as a reward for his attachment. By means of the celebrated admiral Blake † he humbled Spain prodigiously, as also the Algerines and Tunisines. Penn and Venables, two other admirals, made an attempt on the island of Hispaniola; but failing of this, they steered to Jamaica, which was surrendered to them without a blow. Yet so little was thought of the importance of this conquest, that, on their return, the two admirals were committed to the tower, on account of the failure of the principal object of their equipment.

It is not to be supposed that a numerous standing army could be maintained, and so many foreign wars carried on, without incurring extraordinary expences. The protector's revenues were so much exhausted, that he was obliged to have recourse to methods which he probably would not have chosen, had he not been driven to them by necessity. One or two conspiracies entered into by the royalists, which were detected and punished, served him as a pretence to lay a heavy tax upon all that party, of the tenth penny on all their possessions. In order to raise this oppressive imposition, ten major-generals were instituted, who divided the whole kingdom into 60 many military jurisdictions. These men had power to subject whom they pleased to this tax, and to imprison such as denied their jurisdiction. Under colour of these powers they exercised the most arbitrary authority; the people had no protection against their exactions; the very mark of liberty was thrown off, and all property was at the disposal of a military tribunal. It was in vain that the nation cried out for a free parliament. Cromwell assembled one in consequence of their clamours; but as speedily dissolved it when he found it refractory to his commands. At last, as parliaments were always held in such estimation by the people, he resolved to give them one, but such as should be entirely of his own choosing, and chiefly composed of his creatures. Let any of a different complexion should enter the house, guards were placed at the door, and none admitted but such as produced a warrant from his council.

The principal design of convening this assembly was, that

Britain. Who offer him the crown.

186
Which he refuses.

187
His miserable situation,

that they should offer him the crown, with the title of king, and all the other ensigns of royalty. His creatures, therefore, took care to insinuate the confusion there was in legal proceedings without the name of a king; that no man was acquainted with the extent or limits of the present magistrates authority, but those of a king had been well ascertained by the experience of ages. The motion was at last formally made in the house, easily carried through, and nothing was now wanting but Cromwell's own consent to have his name enrolled a mong the kings of England. This consent, however, he never had resolution enough to give. His doubts continued for some days; and the conference carried on with the members who made him the offer, so far as it is on his part intelligible, seems to argue that he was desirous of being compelled to accept the offer: however, the conference ended in his total refusal.

188
And death.

189
Richard Cromwell protector.

With all these proffered honours, and with all his despotic power, the situation of Cromwell was far from being enviable. Perhaps no situation, however mean, or loaded with contempt, could be more truly distressful than his, at the time the nation was loading him with congratulations and addresses. He had at last rendered himself hateful to every party, and he owed his safety to their mutual hatred and diffidence of one another. His arts of dissimulation were exhausted; none could be deceived by them; even those of his own party and principles disdaining the use to which he had converted his zeal and professions. Though the whole nation silently detested his administration, he had not been completely wretched if he could have found domestic consolation. But even his own family had embraced republican principles with so much vehemence, that they could not without indignation behold him invested with uncontrollable power; and Mrs Claypole, his favourite daughter, upbraided him, on her death-bed, with all the crimes which led him to trample on the throne. To add to all this, not only were conspiracies formed against him, but he was at last taught, upon reasoning principles, that his death was not only desirable, but his assassination would be meritorious. A book was published by colonel Titus, a man who had formerly been attached to his cause, entitled *Killing no murder*. Of all the pamphlets that appeared at that time, or perhaps of those that have since appeared, this was the most eloquent and masterly. Cromwell read it, and is said never to have smiled afterwards.

The usurper now found, that the grandeur to which he had sacrificed his former tranquillity was only an inlet to fresh inquietudes. He was haunted with perpetual fears of assassination. He wore armour under his clothes, and always kept pistols in his pockets. His aspect was clouded by a settled gloom, and he regarded every stranger with suspicion. He was always attended by a numerous guard, and travelled in a hurry. He never returned from any place by the road he went; and never slept above three nights together in the same chamber. At last he was delivered from this life of horror and anxiety by a tertian ague, of which he died September 3d 1658, after having usurped the government nine years.

Oliver Cromwell was succeeded in his office of protector by his son Richard, who immediately called a parliament. To this assembly the army presented a re-

monstrance, desiring some person for their general in whom they could confide. The house voted such meetings and remonstrances unlawful: upon which the officers, surrounding Richard's house, forced him to dissolve the parliament; and soon after he signed an abdication of the government. His younger brother Henry, who had been appointed to the command in Ireland, followed Richard's example, and resigned his commission without striking a blow.

The officers, thus left at liberty, resolved to restore the *rump parliament* as it was called, consisting of that remnant of a parliament which had condemned Charles. They were no sooner reinstated in their authority, however, than they began to humble the army by cashiering some of the officers, and appointing others on whom they could have more dependence. The officers immediately resolved to dissolve the assembly. Lambert, one of the general officers, drew up a chosen body of troops; and placing them in the streets which led to Westminster-hall, when the speaker Lenthall proceeded in his carriage to the house, he ordered the horses to be turned, and very civilly conducted him home. The other members were likewise intercepted; and the army returned to their quarters to observe a solemn fast, which generally either preceded or attended their outrages. A committee was then elected, of 23 persons; of whom seven were officers. These they pretended to invest with sovereign authority; and a military government was established, which gave the nation a prospect of endless servitude and tyranny without redress.

Upon hearing that the officers had by their own authority dissolved the parliament, general Monk, who was then in Scotland with 8000 veteran troops, protested against the measure, and resolved to defend the national privileges. As soon as he put his army in motion, he found himself eagerly sought after by all parties; but so cautious was he of declaring his mind, that, till the very last, it was impossible to know which side he designed to take. A remarkable instance of this cautious behaviour was, that, when his own brother came to him with a message from lord Granville in the name of the king, he refused all conversation with him upon hearing that he had told his errand to Mr Price, the general's own chaplain, and a man of known probity and honour.

Hearing that the officers were preparing an army to oppose him, Monk amused them with negotiations; and the people, finding themselves not entirely defenceless, began to declare for a free parliament. The *Rump*, finding themselves invited alio by the navy and part of the army, again ventured to resume their seats, and to thunder votes in their turn against the officers and that party of the army by which they had been ejected. Without taking any notice of Lambert, they sent orders to the troops to repair immediately to the garrisons appointed for them. The soldiers obeyed; and Lambert at last found himself deserted by his whole army. Monk in the mean time proceeded with his army to London. The gentry, on his march, stocked round him with addresses, expressing their desire of a new parliament; but that general, still continuing his inflexible taciturnity, at last came to St Alban's, within a few miles of the capital, leaving all the world in doubt as to his motives and designs. Here he sent the parliament a message, desiring them to remove such forces

Britain. forces as remained in London to country quarters. Some of the regiments willingly obeyed this order; and such as did not, Monk turned out by force: after which he took up his quarters with his army in Westminster. The house voted him thanks for his services: he desired them to call a free parliament; and this soon inspired the citizens to refuse submission to the present government. They resolved to pay no taxes until the members formerly excluded by colonel Pride should be replaced. For this they were punished by Monk, at the desire of the parliament. He arrested 11 of the most obnoxious of the common-council; broke the gates and portcullises; and, having exposed it to the scorn and contempt of all who hated it, he returned in triumph to his quarters at Westminster. The next day, however, he made an apology for this conduct, and promised for the future to co-operate with the mayor and common-council in such schemes as they should approve.

twice urged, to deliver his message to any but the general himself: so that Monk now, finding he could depend on this minister's secrecy, opened to him his whole intentions; but, with his usual caution, refused to commit any thing to paper. In consequence of these, the king left the Spanish territories, where he very narrowly escaped being detained at Breda by the governor, under pretence of treating him with proper respect and formality. From thence he retired to Holland, where he resolved to wait farther advice.

Britain
200
Charles II. leaves Spain.

The new parliament being assembled, Sir Harbottle Grimstone was chosen speaker, a man known to be a royalist in his heart. The affections of all were turned towards the king; yet such were their fears, and such dangers attended a freedom of speech, that no one dared for some days to make any mention of his name. At length Monk gave directions to Annesly, president of the council, to inform them that one Sir John Granville, a servant of the king's, had been sent over by his majesty, and was now at the door with a letter to the house of commons. This message was received with the utmost joy. Granville was called in, the letter read, and the king's proposals immediately accepted of. He offered a general amnesty to all persons whatsoever, and that without any exceptions but what should be made by parliament. He promised to indulge scrupulous consciences with liberty in matters of religion; to leave to the examination of parliament the claims of all such as possessed lands with contested titles; to confirm all these concessions by act of parliament; to satisfy the army under general Monk with respect to their arrears, and to give the same rank to his officers when they should be enlisted in the king's army.

201
His message to the parliament.

In consequence of this good agreement between king and parliament, Montague the English admiral waited on his majesty to inform him that the fleet expected his orders at Scheveling. The duke of York immediately went on board, and took the command as lord high admiral. The king embarked, and landing at Dover, was received by the general, whom he tenderly embraced. He entered London in 1660, on the 29th of May, which was his birth-day; and was attended by an innumerable multitude of people, who testified their joy by the loudest acclamations.

202
He lands in England.

Charles II. was 30 years of age at the time of his restoration. Being naturally of an engaging countenance, and possessed of an open and affable disposition, he was the favourite of all ranks of his subjects. They had now felt the miseries of anarchy, and in proportion to these miseries was the satisfaction they felt on the accession of their young monarch. His first measures were calculated to give universal satisfaction. He seemed desirous of losing the memory of past animosities, and of uniting every party in affection for their prince and country. He admitted into his council the most eminent men of the nation, without regard to former distinctions. The presbyterians shared this honour equally with the royalists. Calamy and Baxter, presbyterian clergymen, were even made chaplains to the king. Admiral Montague was created earl of Sandwich, and general Monk duke of Albemarle. Morrice, the general's friend, was created secretary of state. But what gave the greatest contentment to the nation was the judicious choice which the king at first made of his principal ministers and favourites. Sir Edward Hyde,

198
Restores the secluded members of parliament.

199
New parliament assembled.

The restoration of the expelled members was easily effected; and their number was so much superior to that of the *Rump*, that the chiefs of this last party now thought proper to withdraw in their turn. The restored members began with repealing all those orders by which they had been expelled. They renewed and enlarged the general's commission; fixed a proper stipend for the support of the fleet and army; and, having passed these votes, they dissolved themselves, and gave orders for the immediate assembling of a new parliament. Mean while, Monk new-modelled his army to the purposes he had in view. Some officers, by his direction, presented him with an address, in which they promised to obey implicitly the orders of the ensuing parliament. He approved of this engagement, which he ordered to be signed by all the different regiments; and this furnished him with a pretence for dismissing all the officers by whom it was rejected.

In the midst of these transactions, Lambert, who had been confined in the Tower, escaped from his prison, and began to raise forces; and as his activity and principles were sufficiently known, Monk took the earliest precautions to oppose his measures. He dispatched against him colonel Ingoldsbey, with his own regiment, before Lambert had time to assemble his dependents. That officer had taken possession of Daventry with four troops of horse; but the greater part of them joined Ingoldsbey; to whom he himself surrendered, not without exhibiting strong marks of pusillanimity.

All this time Monk still persisted in his reserve; nor would he intrust his secret intentions with any person, except one Morrice, a gentleman of Devonshire. He was of a sedentary and studious disposition; and with him alone did the general deliberate on the great and dangerous enterprise of the restoration. Sir John Granville, who had a commission from the king, applied for access to the general; but he was desired to communicate his business to Morrice. Granville refused, though

^{Britain.} created earl of Clarendon, was prime minister and chancellor. The marquis, created duke of Ormond, was steward of the household; the earl of Southampton high treasurer; Sir Edward Nicholas secretary of state. These men, united together in the strictest friendship, and combining in the same laudable inclinations, supported each others credit, and pursued the interests of the public.

The parliament having been summoned without the king's consent, received at first only the title of a *convention*; and it was not till after an act passed for that purpose, that they were acknowledged by the name of *parliament*. Both houses owned the guilt of the former rebellion, and gratefully received in their own name, and in that of all the subjects, his majesty's gracious pardon and indemnity. The king had before promised an indemnity to all criminals, but such as should be excepted by parliament: he now issued a proclamation, declaring, that such of the late king's judges as did not surrender themselves within 14 days should receive no pardon. Nineteen surrendered themselves; some were taken in their flight; others escaped beyond sea. The peers seemed inclined to great severity on this occasion; but were restrained by the king, who in the most earnest terms pressed the act of general indemnification.

²⁰⁴
Regicides
punished.

After repeated solicitations, the act of indemnity passed both houses, with the exception of those who had an immediate hand in the king's death. Even Cromwell, Ireton, and Bradshaw, though dead, were considered as proper objects of resentment: their bodies were dug from their graves; dragged to the place of execution; and, after hanging some time, buried under the gallows. Of the rest who sat in judgment on the late monarch's trial, some were dead, and some thought worthy of pardon. Ten only, out of 80, were doomed to immediate destruction; and these were enthusiasts who had all along acted from principle, and who, in the general spirit of rage excited against them, showed a fortitude that would have done honour to a better cause.

This was all the blood that was shed at the restoration. The rest of the king's judges were reprimed, and afterwards dispersed into several prisons. The army was disbanded, that had for so many years governed the nation; prelacy, and all the ceremonies of the church of England, were restored; at the same time that the king pretended to preserve the air of moderation and neutrality. In fact, with regard to religion, Charles, in his gayer hours, was a professed deist; but in the latter part of his life he showed an inclination to the Catholic persuasion, which he had strongly imbibed in his infancy and exile.

²⁰⁵
Death of the
duke of
Gloucester.

On the 13th of September this year, died the young duke of Gloucester, a prince of great hopes. The king was never so deeply affected by any incident in his life. The princess of Orange, having come to England, in order to partake of the joy attending the restoration of her family, with whom she lived in great friendship, soon after sickened and died. The queen-mother paid a visit to her son, and obtained his consent to the marriage of the princess Henrietta with the duke of Orleans, brother to the French king. The parliament having met on the 6th of November, and carried on business with the greatest unanimity and dis-

Parliament
dissolved.

patch, were dissolved by the king on 29th of December 1660. ^{Britain.}

During the reign of Charles II. the spirit of the people seemed to take a turn quite opposite to that in the time of Charles I. The latter found his subjects animated with a ferocious though ignorant zeal for liberty. They knew not what it was to be free, and therefore imagined that liberty consisted in throwing off entirely the royal authority. They gained their point: the unhappy monarch was dethroned and murdered; but instead of liberty, they found themselves involved in much worse tyranny than before. Being happily freed from this tyranny by the restoration, they ran into the contrary extreme; and instead of an unbounded spirit of opposition, there was nothing now to be found but an unbounded spirit of submission; and through the slavish submissions and concessions of the people in this reign, Charles found means to render himself at last almost quite absolute, and to govern without requiring, or indeed without having any occasion for parliament.

A like revolution took place with regard to religious matters. During the former reigns, a spirit of the most gloomy enthusiasm had overspread the whole island, and men imagined that the Deity was only to be pleased by their denying themselves every social pleasure, and refusing every thing that tended to make life agreeable. The extreme hypocrisy of Cromwell and his associates, and the absurd conduct of others, showed that this was not religion; but, in avoiding this error, they ran into one equally dangerous; and every thing religious or serious was discountenanced. Nothing but riot and dissipation took place every where. The court set them the example; nothing but scenes of gallantry and festivity were to be seen; the horrors of the late war became the subject of ridicule; the formality of the sectaries was displayed on the stage, and even laughed at from the pulpit. In short, the best mode of religion now was to have as little as possible; and to avoid not only the hypocrisy of the sectaries, but even the common duties of morality.

In the midst of this riot and dissipation, the old and faithful followers of the royal family were left unrewarded. Numbers who had fought both for the king and his father, and who had lost their whole fortunes in his service, still continued to pine in want and oblivion; while in the mean time their persecutors, who had acquired fortunes during the civil war, were permitted to enjoy them without molestation. The wretched royalists petitioned and murmured in vain; the monarch fled from their expostulations to scenes of mirth and festivity; and the act of indemnity was generally said to have been an act of *forgiveness* to the king's enemies, and of *oblivion* to his friends.

²⁰⁸
Ingratitude
of Charles.

In 1661, the Scots and English parliaments seemed to vie with each other in their prostrations to the king. In England, monarchy and episcopacy were raised to the greatest splendour. The bishops were permitted to resume their seats in the house of peers; all military authority was acknowledged to be vested in the king. He was empowered to appoint commissioners for regulating corporations, and expelling such members as had intruded themselves by violence, or professed principles dangerous to the constitution. An act of uniformity was passed, by which it was required that e-

liaments.

very.

Britain. very clergyman should be re-ordained, if he had not before received episcopal ordination; that he should declare his assent to every thing contained in the book of Common prayer, and should take the oath of canonical obedience. In consequence of this law, above 2000 of the presbyterian clergy resigned their cures at once. In Scotland the right of the king was asserted in the fullest and most positive terms to be hereditary, divine, and indefeasible. His power was extended to the lives and possessions of his subjects, and from his original grant was said to come all that they enjoyed. They voted him an additional revenue of 40,000 l.; and all their former violences were treated with a degree of the utmost detestation.

210
The nation disgusted with the king's extravagance.

This intoxication of loyalty, however, began soon to wear off. The king's profusion and extravagance in his pleasures, together with his indolence in administration, furnished opportunities of making very disadvantageous comparisons between him and Oliver Cromwell. These animosities were heightened by the ejected clergy, especially when they saw Dunkirk, which had been acquired during the usurper's vigorous administration, sold to the French for 40,000 l. and that merely to supply the king's extravagance. From this time (August 17th 1662), Charles found himself perpetually opposed, and his parliaments granted supplies much more reluctantly than before.

211
Marriage with the Infanta of Portugal.

A few months before, the continual exigencies of the king had forced him to conclude a marriage with the Infanta of Portugal for the sake of her portion, which was 500,000 l. in money, together with the fortresses of Tangier in Africa, and of Bombay in the East Indies. The chancellor Clarendon, the dukes of Ormond and Southampton, urged many reasons against this match, particularly the likelihood of her never having any children; but all their objections could not prevail, and therefore Clarendon set himself to promote it as far as lay in his power. Still, however, the king's necessities were greater than his supplies. He therefore resolved to sacrifice his minister the great Clarendon to the resentment of the parliament, to whom he was become obnoxious, in order to procure some more supplies for himself. In 1663, an extraordinary supply was demanded: the king sent for the commons, on the 12th of June, to Whitehall. He complained of their inattention; and by acquainting them of a conspiracy to seize the castle of Dublin, he hoped to furnish a reason for demanding a present supply. Four subsidies were immediately granted, and the clergy in convocation followed the example of the commons. On this occasion the earl of Bristol ventured to impeach the chancellor in the house of peers; but as he did not support his charge, the affair was dropped for the present.

212
War with the Dutch.

With a view probably of having the money to be employed for that purpose in his hands, Charles was induced to declare war against the Dutch in 1664. In this war the English, under the command of Sir Robert Holmes, expelled the Dutch from Cape-Corse castle on the coast of Africa, and likewise seized on their settlements of Cape Verd and the isle of Gorée. Sailing from thence to America, the admiral possessed himself of Nova Belgia, since called *New York*; and which has ever since continued subject to Britain. On the other hand, De Ruyter, the Dutch admiral, dispossessed

the English of all their settlements in Guinea except Cape Corfe. He afterwards sailed to America, where he attacked Barbadoes and Long Island, but was repulsed. Soon after, the two most considerable fleets of each nation met; the one under the duke of York, the other under the duke of Beaufort, and the Dutch admiral, of nearly equal force. The engagement began at four in the morning, and both sides fought with equal intrepidity. The duke of York was in the hottest part of the engagement, and behaved with great spirit and composure, while many of his lords and attendants were killed beside him. In the heat of the action the Dutch admiral's ship blew up; which so discouraged and disheartened them, that they fled towards their own coast, having 30 ships sunk and taken, while the victors lost only one. This success of the English so much excited the jealousy of the neighbouring states, that France and Denmark immediately resolved to protect the republic from such formidable enemies. De Ruyter the great Dutch admiral, on his return from Guinea, was appointed, at the head of 76 sail, to join the duke of Beaufort the French admiral, who it was supposed was then entering the British channel from Toulon. The duke of Albemarle and prince Rupert now commanded the British fleet, which did not exceed 74 sail. Albemarle detached prince Rupert with 20 ships to oppose the duke of Beaufort; against which piece of rashness Sir George Ayseue protested in vain. The fleets thus engaging upon unequal terms, a most memorable battle ensued. The first day, the Dutch admiral De Ruyter was killed by a cannon-ball, one of their ships was thrown up, and three of the English ships taken; the combatants were parted by darkness. The second day they renewed the battle with incredible fury. Sixteen more ships joined the Dutch; and the English were shattered, that their fighting ships were reduced to 28. Upon retreating towards their own coast, the Dutch followed them; where another dreadful conflict was beginning, but parted by the darkness of the night as before. The morning of the third day the English continued their retreat, and the Dutch their pursuit. Albemarle came to the desperate resolution of blowing up his own ship rather than submit to the enemy, when he found himself happily reinforced by prince Rupert with 16 ships of the line. By this time it was night; and the next day the fleet came again to a close combat, which was continued with great violence, till they were parted by a mist. Sir George Ayseue having the misfortune to strike on the Galoper (und), was taken, with a ship of 100 guns.

Both sides claimed the victory, but the Dutch certainly had the advantage in this engagement. A second, however, equally bloody, happened soon after, with larger fleets on both sides, commanded by the same admirals. In this the Dutch were vanquished; but they were soon in a condition to face their enemies, by the junction of Beaufort the French admiral. The Dutch fleet appeared in the Thames, conducted by the English admiral. The English were thrown into the utmost consternation: a chain had been drawn across the river Medway; and some fortifications had been added to the fort, along the bank. But all these were unequal to the present force: Sheerness was soon taken; the Dutch passed forward and broke the chain, though

Britain. fortified by some ships sunk by Albemarle's orders. Destroying the shipping in their passage, they still advanced, with six men of war and five fire ships, as far as Upmore castle, where they burned three men of war. The whole city of London was in consternation; it was expected that the Dutch might sail up next tide to London-bridge, and destroy not only the shipping, but even the buildings of the metropolis. The Dutch, however, were unable to prosecute that project from the failure of the French who had promised them assistance. Spreading therefore an alarm along the coast, and having infested Norwich, they returned to their own coasts.

215
Peace and
fire at Lon-
don.

During these transactions abroad, happened a great plague at London, which destroyed 100,000 of the inhabitants. This calamity was soon followed by another, still more dreadful if possible. A fire broke out in a baker's house in Pudding-lane near the bridge, and spread with such rapidity, that no efforts could extinguish it, till it laid in ashes the most considerable part of the city. This calamity, though it reduced thousands to beggary, proved in the end both beneficial and ornamental to the city. It rose from its ruins in greater beauty than ever; the streets being widened, and the houses built of brick instead of wood, became thus more wholesome and secure. In so great a calamity it is remarkable that not a single life was lost.

These complicated misfortunes did not fail to excite many murmurs among the people: The blame of the fire was laid on the Papists: the Dutch war was exclaimed against as unsuccessful and unnecessary, as being an attempt to humble that nation who were equal enemies to Popery with themselves. Charles himself also began to be sensible, that all the ends for which he had undertaken the Dutch war were likely to be entirely frustrated. Instead of being able to lay up money for himself, the supplies of parliament had hitherto been to scanty, that he found himself considerably in debt. A treaty therefore was set on foot, which was concluded at Breda on the 21st of July 1667. By this treaty the only advantage gained by Britain was, the cessation of the colony of New York. It was therefore judged disgraceful, and the blame of it thrown upon the unhappy earl of Clarendon. Along with this, he was charged with the sale of Dunkirk; the bad payment of the sea-men; the disgrace by the Dutch fleet; and his own ambition. His daughter, while yet in Paris, had commenced an amour with the duke of York; and under a solemn promise of marriage had admitted him to her bed. Her lover, however, either of his own accord, or through the persuasions of his brother Charles, afterwards married her; and this too was imputed as a crime to Clarendon. On these accusations, the king, who on account of his rigid virtue had never much loved this nobleman, ordered the seals to be taken from him, and given to Sir Orlando Bridgemen. Clarendon was again impeached; and though the charges were manifestly frivolous, yet so strong was the popular torrent against him, that he thought proper to withdraw into France. Soon after, the king formed an alliance with Holland and Sweden, in order to prevent the French king from completing his conquest of the Netherlands. The greatest part of this country he had already subdued, when he was unexpectedly stopped by this league; in which it was agreed by the contracting

Britain. powers, that they would constitute themselves arbiters of the differences between France and Spain, and check the exorbitant pretensions of either.

219
Arbitrary
Proceedings
of Charles.

The king now began to act in a very arbitrary manner. He had long wished to extend his prerogative, and to be able to furnish himself with whatever sums he might want for his pleasures, and therefore was most likely to be pleased with those ministers who could flatter both his wishes at once. These he found in Clifford, Ashley, Buckingham, Arlington, and Lauderdale, a junto distinguished by the name of the *cabal*; a word formed by the initials of their names. The first effects of their advice was a secret alliance with France, and a rupture with Holland. Soon after this, the duke of York declared himself a Papist; and liberty of conscience was proclaimed to all sectaries, whether dissenters or Papists: a proclamation was issued containing very rigorous clauses in favour of pressing; another full of menaces against those who should speak undutifully of his majesty's measures; and even against those who heard such discourses, unless they informed in due time against the offenders. All these things gave very great and just offence to the people; but they were especially alarmed at the alliance with France, and justly afraid of the treachery of that nation.

220
New war
with Hol-
land.

221
A desperat-
naval en-
gagement.

On the 28th of May 1672, the English fleet under the duke of York was surprised by the Dutch in Southwold bay. About eight in the morning began a most furious engagement. The gallant Sandwich, who commanded the English van, drove his ship into the midst of the enemy, beat off the admiral that ventured to attack him, sunk another ship that attempted to board him, and three fire ships that offered to grapple with him. Though his vessel was torn with shot, and out of 1000 men there only remained 400, he still continued to fight. At last, a fire-ship, more fortunate than the rest, having laid hold of his vessel, her destruction became inevitable, and the earl himself was drowned in attempting to swim to some other ship. Night parted the combatants; the Dutch retired, and were not followed by the English. The loss sustained by the two maritime powers was nearly equal; but the French suffered very little, not having entered into the heat of the engagement. It was even supposed that they had orders for this conduct, and to spare their own ships, while the Dutch and English should weaken each other by their mutual animosities.

222
Success of
Louis XIV.
against the
Dutch.

The combined powers were much more successful against the Dutch by land. Louis conquered all before him, crossed the Rhine, took all the frontier towns of the enemy, and threatened the new republic with a final dissolution. Terms were proposed to them by the two conquerors. Louis offered them such as would have deprived them of all power of resisting an invasion from France by land. Those of Charles exposed them equally to every invasion by sea. At last the murmurs of the English at seeing this brave and industrious people, the supporters of the Protestant cause, totally sunk and on the brink of destruction, were too loud not to reach the king. He was obliged to call a parliament, to take the sense of the nation upon his conduct; and he soon saw how his subjects stood affected.

223
A parlia-
ment called.

The parliament met on the 4th of February 1673. They began with repressing some of the king's extraordinary stretches of prerogative, and taking means for uniformity

rain. uniformity in religious matters. A law was passed entitled the *test act*, imposing an oath on all who should enjoy any public benefice. Besides the taking the oaths of allegiance and the king's supremacy, they were obliged to receive the sacrament once a-year in the established church, and to abjure all belief in the doctrine of transubstantiation. As the dissenters also had seconded the efforts of the commons against the king's declaration of indulgence to Roman Catholics, a bill was passed for their ease and relief, which, however, went with some difficulty through the house of peers. The Dutch in the meantime continued to defend themselves with such valour, that the commons began to despair of success. They therefore resolved that the standing army was a grievance; they next declared, that they would grant no more supplies to carry on the Dutch war, unless it appeared that the enemy were so obstinate as to refuse all reasonable conditions. To cut short these disagreeable altercations, the king resolved to prorogue the parliament; and, with that intention, went unexpectedly to the house of peers, from whence he sent the usher of the black-rod to summon the house of commons to attend. It happened that the usher and the speaker met nearly at the door of the house; but the speaker being within, some of the members suddenly that the door, and cried "To the chair." Upon which the following motions were instantly made in a tumultuous manner: That the alliance with France was a grievance; that the civil counsellors of the king were a grievance; that the earl of Lauderdale was a grievance; and then the house rose in great confusion. The king soon saw that he could expect no supply from the commons for carrying on the war which was so disagreeable to them; he resolved, therefore, to make a separate peace with the Dutch, on terms which they had proposed by the Spanish ambassador. For form's sake, he asked the advice of his parliament; who concurring heartily in his intentions, a peace was concluded accordingly.

226
ional
contents. The prepossession which Charles had all along shown for France, and his manifest inclination upon all occasions to attach himself to that kingdom, had given great offence to his people. Along with this, other circumstances conspired to raise a general discontent. The toleration of Catholics, so much wished for by the king; the bigotry of the duke of York, the heir apparent to the crown, and his zeal for the propagation of the Catholic religion; excited a consternation not altogether without foundation, as if the Protestant religion was in danger. This fear and discontent was carefully kept up and fomented by wicked and designing men, who to promote their own interests would not scruple to advance the grossest falsehoods. In 1678, an account of a plot formed by the papists for destroying the king and the protestant religion, was given in by one Kirby a chemist, Dr Tong, a weak credulous clergyman, and Titus Oates, who had likewise been a clergyman, but one of the most abandoned intercarants that can be imagined. The circumstances attending this pretended discovery were so perfectly incredible, that it appears amazing how any person of common sense could give ear to them. Nevertheless, so much were the minds of the nation in general inflamed against the Catholics at this time, that it not only produced the destruction of individuals of the Romish persuasion, but an universal massacre of that unhappy sect was apprehended. The

parliament, who ought to have repressed these delusions, and brought back the people to calm deliberate inquiry, were found more credulous than even the vulgar themselves. The cry of plot was immediately echoed from one house to the other; the country party could not slip so favourable an opportunity of managing the passions of the people; the courtiers were afraid of being thought disloyal if they should doubt the guilt of those who were accused of designs against the king's person. Danby, the prime minister, himself entered into it very furiously, and persisted in his inquiries notwithstanding all the king's advices to the contrary. Charles himself, who was the person that ought to have been most concerned; was the only one who treated it with contempt. Nothing, however, could stop the popular fury; and for a time the king was obliged to give way to it.

227
Lord Dan-
by impeach-
ed. During the time of this general uproar and persecution, the lord treasurer Danby was impeached in the house of commons by Seymour the speaker. The principal charge against him was, his having written a letter to Montague the king's ambassador at Paris, directing him to sell the king's good offices at the treaty of Nimeguen, to the king of France, for a certain sum of money; contrary to the general interests of the confederates, and even of those of his own kingdoms. Tho' the charge was just, yet Danby had the happiness to find the king resolved to defend him. Charles assured the parliament, that, as he had acted in every thing by his orders, he held him entirely blameless; and though he would deprive him of all his employments, yet he would positively insist on his personal safety. The lords were obliged to submit; however, they went on to impeach him, and Danby was sent to the Tower, but no worse consequences followed.

These furious proceedings had been carried on by an house of commons that had continued undissolved for above 17 years. They were now dissolved, and another parliament was called; which, however, proved as unmanageable as the preceding. The members resolved to check the growth of Popery by striking at the root of the evil; and therefore brought in a bill for the total exclusion of the duke of York from the crown of England and Ireland, which passed the lower house by a majority of 79. They next voted the king's standing army and guards to be illegal. They proceeded to establish limits to the king's power of imprisoning to delinquents at will. It was now also that the celebrated statute called the *habeas corpus act* was passed, which confirms the subject in an absolute security from oppressive power.

228
Ex-liauer
of the
duke. During these troubles the duke of York had retired to Brussels; but an indisposition of the king led him back to England, to be ready, in case of any sinister accident, to assert his right to the throne. After prevailing upon his brother to disgrace his natural son the duke of Monmouth, who was now become very popular, he himself retired to Scotland, under pretence of quieting the apprehensions of the English nation, but in reality to strengthen his interests in that part of the empire. This rebellion served still more to inflame the country party, who were strongly attached to the duke of Monmouth, and were resolved to support him against the duke of York. Mobs, petitions, pope-burnings, were artifices employed to keep up the terrors of Popery and alarm the court. The parliament had shown favour to the various tribe of impostors, and that served to in-

Oates.

Britain. crease the number of these miscreants; but plots themselves also became more numerous. Plot was set up against plot; and the people were kept suspended in the most dreadful apprehension.

But it was not by plots alone that the adverse parties endeavoured to supplant each other. Tumultuous petitions on the one hand, and flattering addresses on the other, were sent up from all quarters. Wherever the country party prevailed, petitions were sent to the king filled with grievances and apprehensions. Wherever the church or court party prevailed, addresses were framed, containing expressions of the highest regard to his majesty, and the deepest abhorrence of those who endeavoured to disturb the public tranquillity. Thus the nation came to be distinguished into *petitioners* and *abhorers*. *Whig* and *Tory*, also, were now first used as terms of reproach. The whigs were now first used as terms of reproach. The whigs were now first used as terms of reproach. The whigs were now first used as terms of reproach.

Attempt to
establish e-
piscopacy in
Scotland.

All this time the king had tyrannized over the Scots in a very cruel manner. Being apprized of the tendency of presbyterian principles to a republican form of government, Charles, like his predecessors, had endeavoured to introduce episcopacy there, but in a much more violent manner than had been formerly attempted. The rights of patrons had for some years been abolished; and the power of electing ministers had been vested in the kirk-session and lay elders: but it was now enacted, that all incumbents who had been admitted upon this title should receive a presentation, and be instituted anew by the bishop, under the penalty of deprivation. In consequence of this, 350 parishes were at once declared vacant. New ministers were sought for all over the kingdom, and none was so vicious or ignorant as to be rejected. The people, as might have been expected, were displeased to the highest degree; they resolved, however, to give no sign of mutiny or sedition, notwithstanding their discontent. This submission made their case still worse; it being foolishly imagined, that, as they did not complain for a little ill usage, they would submit altogether if they were worse treated.

231
Occasions
discontent.

232
Presbyteri-
ans persecu-
ted.

Affairs remained in a peaceable situation, till, in 1664, a very severe act was passed in England against conventicles; and this severity was imitated by the Scots parliament, who passed an act of the same kind. Military force was next let loose. Wherever the people had generally forsaken their churches, the guards were quartered throughout the country. They were commanded by Sir James Turner, a man of a very furious temper and dissolute life. He went about and received hits from the clergy of those who absented themselves from the churches, or were supposed to frequent conventicles. Without any proof, or legal conviction, he demanded a fine from them; and quartered soldiers on the supposed criminals till he received payment. An insurrection being dreaded during the Dutch war, new forces were levied, and entrusted to the command of Dalziel and Drummond, two men of very cruel dispositions, and the Scots parliament gave full scope to all their enmities.

Representations were now made to the king, who

promised some redress. But his lenity came too late. The people, in 1668, rose in arms. They surprized Turner in Dumfries, and resolved to have put him to death; but finding his orders to be more violent than his execution of them, they spared his life. At Lanark they renewed the covenant, and published their manifesto; where they professed their submission to the king, and only desired the re-establishment of presbytery, and of their former ministers. Their force never exceeded 2000 men; and though the country in general bore them great favour, mens spirits were so subdued, that the insurgents could expect no farther increase of numbers. Dalziel took the field to oppose them. The number of the covenanters was now reduced to 800, and these no way capable of contending with regular forces. Having advanced near Edinburgh, they attempted to find their way back into the west by Pentland hills. Here they were attacked by the king's troops, and received the first charge very resolutely; but that was all the action. Immediately they fell into confusion, and fled. About 40 were killed on the spot, and 130 taken prisoners.

235
Cruelty
archbishop
Sharpe.

So long ago as the year 1661, the presbyterians had deputed one Sharpe to lay their grievances before the king. Instead of this, their deputy abandoned the cause altogether, became their violent enemy, and as a reward of his treachery was made archbishop of St Andrews. After the battle of Pentland-hills, this man was the foremost to take vengeance on the unhappy insurgents, whose oppressed state and inoffensive behaviour had made them objects of universal compassion. Ten were hanged on one gibbet in Edinburgh; 35 before their own doors in different places. They might all have saved their lives, if they would have renounced the covenant; but this they absolutely refused. The executions were going on, when the king wrote a letter to the privy council, in which he ordered that such of the prisoners as should simply promise to obey the laws for the future should be set at liberty, and that the incorrigible should be sent to the plantations. This letter was brought to the council by Burnet, but was not immediately delivered by Sharpe. What his motives were for this delay, we pretend not to say; but certain it is, that no action of his life will bear a worse construction than this. It had been customary to put these poor creatures to very severe tortures, in order to make them confess that to be falsehood which they believed to be true. By Sharpe's delay, one Hugh Maccaill had been tortured, who would otherwise have escaped; and so violent were the torments he endured, that he expired under them. He seemed to die in an ecstasy of joy. His last words were uttered with an accent which struck all the bylanders of Mr M with astonishment. "Farewell (said he) sun, moon, and stars; farewell world and time; farewell weak frail body; welcome eternity; welcome angels and saints; welcome Saviour of the world; and welcome God the judge of all."

236
Last wor-
d of Mr M
caill.

In 1670, an act against conventicles was passed, seemingly with a design of mitigating the former persecuting laws; though even this was severe enough. By this act, the hearer in a conventicle (that is, in a dissenting assembly where more than five beside the family were present) was fined 5s. for the first offence, and 10s. for the second; the preacher L.20 for the first offence,

237
Act agai-
nst conventi-
cles.

tain. offence, and L.40 for the second. The person in whose house the conventicle met was fined a like sum with the preacher. One remarkable clause was, that if any dispute should arise with regard to the interpretation of any part of the act, the judges should always explain the doubt in the sense least favourable to conventicles, it being the intention of parliament entirely to suppress them.

238
nies of
prehens-
and in-
cence.

As the violent methods used by the king were found ineffectual to obtain his purpose in Scotland, in 1678 a scheme of comprehension was tried, by which it was proposed to diminish greatly the authority of the bishops, to abolish their negative voice in the ecclesiastical courts, and to leave them little more than the right of precedency among the presbyters: but this too was rejected by the people, who well knew its tendency. The next scheme was an indulgence. By this, the most popular of the expelled preachers, without requiring any terms of submission to the established religion, were settled in vacant churches; and small salaries of about L.20 a-year were offered to the rest, till they should be otherwise established. This bounty was rejected as the wages of criminal silence, and the replaced ministers soon repented of their compliance; conventicles multiplied, and the covenanters daily met in arms at their places of worship, though they usually dispersed themselves after divine service.

39
execution
wvcd.

These mild methods being rejected, a renewal of the persecution commenced under the administration of the duke of Lauderdale, and in which archbishop Sharpe had a principal hand. It was an old law, and but seldom put in execution, that a man who was accused of any crime, and did not appear to take his trial, might be *intercommuned*; that is, he might be publicly outlawed; and whoever afterwards, either on account of business, relation, or charity, had the least intercourse with him, was subjected to the same penalties which the law could inflict on the criminal himself. A great many writs of intercommuning were now issued against the covenanters; by which absurd method of proceeding, crimes and punishments were multiplied to an extreme degree.

40
bishop
be
suffered.

Application was made to Charles for some rediefs of these grievances: but he was too much taken up with his pleasures to take any effectual means of putting a stop to them; nay, even while he retracted them, he was persuaded to avow and praise them in a letter to the privy council. The consequence of all this was, that the covenanters were at last so much enraged against Sharpe, whom they considered as an apostate, and experienced to be an unrelenting persecutor, that, on the 3d of May 1679, he was way-laid and murdered with all the circumstances of unrelenting cruelty. The murder of Sharpe produced a persecution still more violent, which at last brought on another insurrection.

41
id in-
ation.

The covenanters finding themselves obliged to meet in large bodies, and bring arms along with them for their own security, set forth a declaration against prelacy, which they published at Rutherglen, a small borough near Glasgow: and in the market-place there they burned several acts of parliament which had established that mode of ecclesiastical government, and had prohibited all conventicles. For this purpose they chose the 29th of May, the anniversary of the restoration;

and previously extinguished the bonfires that had been kindled on that occasion. Count Graham, afterwards viscount Dundee, an active and enterprising officer, attacked a great conventicle upon Loudon-hill, but was repulsed with the loss of 30 men. The covenanters then finding themselves unwarily engaged in rebellion, were obliged to persevere: and therefore pushed on to Glasgow, which, though repulsed at first, they afterwards made themselves masters of. Here they dispossessed the established clergy, and issued proclamations, in which they declared that they fought against the king's supremacy, against Popery and Prelacy, and against a Popish successor.

Charles, being now alarmed, dispatched against the covenanters a small body of English cavalry under the duke of Monmouth. He joined the Scots guards, and some regiments of militia levied from the well-affected counties; and with great celerity marched in quest of the insurgents. They had taken post at Bothwell-bridge between Hamilton and Glasgow; where there was no access but by the bridge, and whose a small body was able to defend it against the king's army. The whole army of the covenanters never exceeded 8000 men, and they had in reality no other generals than their clergymen. Monmouth attacked the bridge, and the covenanters maintained their post as long as their ammunition lasted. When they sent for more, they received orders to quit their post and retire; and this imprudent measure occasioned an immediate defeat. Monmouth passed the bridge without opposition, and drew up his forces opposite to the enemy. His cannon alone put them to the rout. About 700 were killed in the pursuit; for, properly speaking, there was no action. Twelve hundred were taken prisoners, and treated with humanity by Monmouth. Such as promised to live peaceably under the present government were dismissed; and about 300 who refused this condition were shipped for Barbadoes, but unfortunately perished by the way. Two of their clergymen were hanged. Soon after, an act of indemnity was passed: but Lauderdale took care that it should afford little protection to the unhappy covenanters; for though orders were given to connive thenceforward at all conventicles, he found means under a variety of pretences to elude the execution of them.

It is now certainly known, that king Charles II. had formed a scheme of overturning the established religion, and substituting Popery in its place; as also of rendering himself absolute. In this, however, he met with violent opposition from his parliaments; and as this one of 1679 seemed even to surpass their predecessors in violence, the king was induced to dissolve them and call another in 1680. By this step, however, he was not a gainer. They voted the legality of petitioning the king; and fell with extreme violence on the abhorers, who in their addresses to the crown had expressed their disapprobation of those petitions. Great numbers of these were seized by their order in all parts of England, and committed to close custody: the liberty of the subject, which had been so carefully guarded by their own recent law, was every day violated by their arbitrary and capricious imprisonments. One Stowel of Exeter put a stop to their proceedings: he refused to obey the serjeant at arms who was sent to apprehend him; he stood upon his defence, and said he knew no

ment.

Britain. law by which the house of commons pretended to commit him. The house, finding it equally dangerous to proceed or recede, got off by an evasion. They voted that Stowel was indisposed: and a month's time was allowed him for his recovery. It is happy for the nation, that should the commons at any time overleap the bounds of their authority, and capriciously order men to be put in prison, there is no power, in case of resistance, that can compel the prisoners to submit to their decrees.

The chief point, however, laboured by the present parliament was, to obtain the exclusion bill, which, though the former house had voted, was never yet passed into a law. It passed by a great majority in the house of commons, but was thrown out by the house of peers. All the bishops except three voted against it; for they were of opinion that the church of England was in much greater danger from the prevalence of presbyterianism than Popery. The commons were extremely mortified at the rejection of their favourite bill: in revenge, they passed several other disagreeable acts, among which one was, That, till the exclusion bill was passed, they could not, consistent with the trust reposed in them, grant the king any manner of supply; and that whoever should hereafter lend, by way of advance, any money upon any branches of the king's revenue, should be responsible to parliament for his conduct. Charles, therefore, finding that there were no hopes of extorting either money or obedience from the commons, came to a resolution of once more dissolving the parliament. His usher of the black rod accordingly came to dissolve them while they were voting that the dissenters should be encouraged, and that the Papists had burned the city of London.

244
Parliament
dissolved.

It was for some time a doubt whether the king would ever call another parliament: his necessities, however, surmounted all his fears of their violence; and, in 1681, he summoned his parliament to meet him at Oxford, that he might thus have an opportunity of punishing the city of London by showing his suspicions of their loyalty. In this, as in all former parliaments, the country party predominated; and they trode exactly in the same paths with their predecessors. The same speaker was chosen, and the exclusion bill urged more fiercely than before. Ernelly, one of the king's ministers, proposed that the duke should be banished 500 miles from England; and that on the king's decease the next heir should be constituted regent with regal power. Yet even this expedient, which left the duke the bare title of king, could not obtain the attention of the house. Nothing but a total exclusion could satisfy them.

245
New one
called at
Oxford.

Each party had now for some time reviled and ridiculed each other in pamphlets and libels; and this practice at last was attended with an incident that deserves notice. One Fitzharris, an Irish Papist, employed a Scotman named *Everhart* to write a libel against the king and the duke of York. The Scot was actually a spy for the contrary party; and supposing this a trick to entrap him, he discovered the whole to Sir William Waller, an eminent justice of the peace; and, to convince him of the truth of his information, posed the magistrate and two other persons privately, where they heard the whole conference between Fitzharris and himself. The libel composed between them was replete with the utmost rancour and scurrility. Waller carried

246
Case of Fitz-
harris.

the intelligence to the king, and obtained a warrant for committing Fitzharris, who happened at that very time to have a copy of the libel in his pocket. Seeing himself in the hands of a party from whom he expected no mercy, he resolved to side with them, and throw the odium of the libel upon the court, who, he said, were willing to draw up a libel which should be imputed to the exclusioners, and thus render them hateful to the people. He enhanced his services to the country-party by a new Popish plot more tremendous than any of the foregoing, and in which he brought in the duke of York as a principal accomplice.

The king imprisoned Fitzharris; the commons avowed his cause. They voted that he should be impeached by themselves, to screen him from the ordinary forms of justice: the lords rejected the impeachment; the commons asserted their right: a commotion was likely to ensue; and the king, to break off the contest, went to the house and dissolved the parliament, with a fixed resolution never to call another.

247
Parliament
dissolved

From this moment the king ruled with despotic power. His temper, which had always been easy and merciful, now became arbitrary and cruel; he entertained spies and informers round the throne, and imprisoned all such as he thought most daring in their designs. He resolved to humble the presbyterians: they were divested of their employments and their places; and their offices given to such as held with the court, and approved the doctrine of non-resistance. The clergy began to testify their zeal and their principles by their writings and sermons; but though among these the partizans of the king were the most numerous, those of the opposite faction were the most enterprising. The king openly espoused the cause of the former; and thus placing himself at the head of a faction, he deprived the city of London, which had long headed the popular party, of their charter. It was not till after an abject submission that he restored it to them, having previously subjected the election of their magistrates to his immediate authority.

248
Arbitrar
proceedi
of the ki

Terrors also were not wanting to confirm this new species of monarchy. Fitzharris was brought to a trial before a jury, and condemned and executed. The whole gang of spies, witnesses, informers, suborners, which had long been encouraged and supported by the leading patriots, finding now that the king was entirely master, turned short upon their ancient drivers, and offered their evidence against those who first put them in motion. The king's ministers gave them encouragement; and in a short time the same injustice and the same cruelties were practised against presbyterian schemes that had formerly been practised against Catholic treasons. The king's chief resentment was levelled against the earl of Shaftesbury; and, indeed, not without reason, as he had had a very active hand in the late disturbances. No sum was spared to seek for evidence, or even to suborn witnesses, against this intriguing and formidable man. A bill of indictment being presented to the grand jury, witnesses were examined, who swore to such incredible circumstances as must have invalidated their testimony, even if they had not been branded as perjured villains. Among his papers, indeed, a draught of an association was found, which might have been construed into treason; but it was not in the earl's hand-writing, nor could it be

privied of
charter.

Britain. proved that he had ever communicated this scheme to any body, or signified his approbation of any such project. The sheriffs had summoned a jury, whose principles coincided with those of the earl; and that probably, more than any want of proof, procured his safety.

250
Other corporations refuse theirs.
In 1683, the city of London was deprived of its charter; which was restored only upon terms of the utmost submission, and giving up the nomination of their own magistrates. This was so mortifying a circumstance, that all the other corporations in England soon began to fear the same treatment, and were successively induced to surrender their charters into the hands of the king. Considerable sums were exacted for restoring these charters; and all the offices of power and profit were left at the disposal of the crown. Resistance now, however justifiable, could not be safe; and all prudent men saw no other expedient but submitting patiently to the present grievances.

251
Conspiracy against the king.
There was a party, however, in England, that still cherished their former ideas of freedom, and resolved to restore liberty to their country by dethroning the king who acted in such a despotic manner. The principal conspirators were Monmouth, Shaftesbury, Ruffel, Essex, Howard, Algernon Sidney, and John Hamden grandson to the great man of that name. Monmouth engaged the earl of Macclesfield, Lord Brandon, Sir Gilbert Gerard, and other gentlemen in Cheshire. Lord Ruffel fixed a correspondence with Sir William Courtney, Sir Francis Knowles, and Sir Francis Drake, who promised to raise the west. Shaftesbury, with one Ferguson, an independent clergyman, and a restless plotter, managed the city, upon which the confederates chiefly relied. These schemes had been laid in 1681: but the caution of Lord Ruffel, who induced the duke of Monmouth to put off the enterprize, saved the kingdom from the horrors of a civil war; while Shaftesbury was so struck with a sense of his impending danger, that he left his house, and, lurking about the city, attempted, but in vain, to drive the Londoners to an open insurrection. At last, enraged at the numberless cautions and delays which clogged and defeated his projects, he threatened to begin with his own friends singly. However, after a long struggle between fear and rage, he abandoned all hopes of success, and fled to Amsterdam, where he soon after died.

The loss of Shaftesbury, though it retarded, did not suppress, the designs of the conspirators. The remaining six formed a council; they corresponded with Argyle and the malecontents in Scotland; and resolved to prosecute the scheme of the insurrection, tho' they widely differed in principles from one another. Monmouth aspired at the crown; Ruffel and Hamden proposed to exclude the duke of York from the succession, and redress the grievances of the nation; Sidney was for restoring the republic, and Essex joined in the same wish. Lord Howard was an abandoned man, who, having no principles, sought to embroil the nation, to gratify his private interest in the confusion.

252
Sign of affirming in form.
Besides these, there was a set of subordinate conspirators, who frequently met together, and carried on projects quite unknown to Monmouth and his council. Among these was colonel Rumsey, an old republican officer; lieutenant-colonel Walcot, of the same stamp; Goodenough, under sheriff of London, a zealous

and noted party-man; Ferguson, an independent minister; and several attorneys, merchants, and tradesmen of London. But Rumsey and Ferguson were the only persons that had access to the great leaders of the conspiracy. These men undertook the desperate resolution of assassinating the king in his way to New-market; Rumbold, one of the party, possessed a farm upon that road, called the *Rye-houfe*, and from thence the conspiracy was called the *Rye-houfe plot*. They deliberated on a scheme of stopping the king's coach by overturning a cart on the high way at this place, and shooting him through the hedges. The house in which the king lived at New-market accidentally took fire, and he was obliged to leave New-market eight days sooner than was expected; to which circumstance he owed his safety. Soon after this the conspiracy was discovered; Ruffel, Sidney, and Walcot, were executed; Essex cut his own throat; Hamden was fined 4000*l.*; and scarce one escaped who had been in any manner concerned, except the duke of Monmouth, who was the most culpable of all.

This was the last blood that was shed on account of plots or conspiracies, which continued during the greatest part of this reign. Severe punishments, however, were inflicted on many who treated the duke of York unworthily. The famous Titus Oates was fined 100,000*l.* for calling him a Popish traitor; and he was imprisoned till he should pay it, which he was absolutely incapable of. A similar sentence was passed upon Dutton Colt. Sir Samuel Barnardisen was fined 10,000*l.* for having, in some private letters, reflected on the government. The government of Charles was now as absolute as that of any prince in Europe; but, to please his subjects by an act of popularity, he judged it proper to marry the lady Anne, his niece, to prince George brother to the king of Denmark. This was the last remarkable transaction of this extraordinary

253
Death of Charles II.
reign. On February 2d 1685, about eight in the morning, the king was seized with a fit of the apoplexy; being dressed, and just come out of his closet, where he had been for some time after he rose from bed. By being blooded, he was restored perfectly to his senses; and there were great hopes of his recovery the next day. On the fourth day the physicians despaired of his life, and therefore sent for the queen. He was in his perfect senses when she arrived. She threw herself on her knees, and asked his pardon for all her offences. He replied, that she had offended in nothing; but that he had been guilty of offences against her, and asked her pardon. He spoke with great affection to the duke of York, and gave him excellent counsel for his future conduct. He advised him to adhere to the laws with strictness, and invariably to support the church of England. The duke seemed anxious to convince him before he died how little he intended to follow his advice. Having removed the bishops, and several of the lords who attended the bed of the king, he sent for Huddleston, a Romish priest. In the presence of the duke, the earl of Bath, and Trevanion a captain in the guards, Huddleston gave the extreme unction to the king, and administered to him the sacrament according to the rites of the church of Rome. All this was done in the space of half an hour. The doors were then thrown open. Six prelates, who had before attended the king, were sent for to give him the sacrament.

Britain.

facrament. Kenn, bishop of Bath and Wells, read the visitation of the sick; and, after he said that he repented of his sins, the absolution. The king assited with seeming devotion at the service; but his mouth being distorted with fits, and his throat contracted, he could not swallow the elements. He professed, however, his satisfaction in the church of England; and expired on the 6th of February, between 11 and 12 o'clock; having reigned 25 years, and lived 55.

The first act of James II's reign was to assemble the privy council: where, after some praises bestowed on the memory of his predecessor, he made professions of his resolution to maintain the established government both in church and state; and as he had heretofore ventured his life in defence of the nation, he would still go as far as any man in maintaining all its just rights and privileges.

255
Serrile ad-
dresses to
James II.

This discourse was received with great applause, not only by the council, but by the whole nation. Addresses came from all quarters, full of duty, nay of the most servile adulation. From this charge, however, we must except those of the Quakers, which is remarkable for its good sense and simplicity. "We are come (said they) to testify our sorrow for the death of our good friend Charles, and our joy for thy being made our governor. We are told that thou art not of the persuasion of the church of England no more than we: wherefore we hope that thou wilt grant us the same liberty which thou allowest thyself. Which doing, we will thee all manner of happiness."

256
Qual.ers
address.

The king, however, soon showed, that he either was not sincere in his promises, or that he entertained so lofty an idea of his own legal power, that even his utmost sincerity could tend very little to the security of the liberties of the people. All the customs, and the greater part of the excise, which had been voted to the late king for his life only, were levied by James without a new act for that purpose. He went openly to mass with all the ensigns of his dignity; and even sent one Caryl as his agent to Rome to make submissions to the Pope, and to pave the way for the re-admission of England into the bosom of the Catholic church. From the suggestions of these men all his measures were undertaken. One day when the Spanish ambassador ventured to advise his majesty against putting too much confidence in such kind of people, "Is it not the custom in Spain (said James), for the king to consult with his confessor?" "Yes (answered the ambassador), and that is the reason why our affairs succeed so very ill."

James's first parliament, which was composed mostly of zealous tories, was strongly inclined to comply with the measures of the crown. They voted unanimously, that they should settle on the present king, during life, all the revenue enjoyed by the late king till the time of his decease. For this favour, James assured them, that he would secure them in the full enjoyment of their laws; but with regard to religion, no answer could be extorted, for that he was resolved to alter. In every thing, however, religion excepted, James merited every praise. He applied himself to business with unremitting attention. He managed his revenue with the strictest economy. He retrenched superfluous expences, and showed himself zealous for the glory of the nation. He endeavoured to expel from court the vice which had prevailed so much during the former reign, and to restore

258

spect- held
have: well

decency and morality. He presided daily at the council, at the boards of admiralty and treasury. He even entered into the whole detail of the concerns of the great departments of the state. But his bigotry for the Romish religion sullied all his good qualities, and rendered him feared for his violence, where he was not despised for his weakness.

Britain.

But whilst every thing was submitted in tranquillity to James at home, a storm was gathering abroad to disturb his repose. For a long time the prince of Orange had entertained hopes of ascending the British throne, and had even used all his endeavours to exclude James from it. Monmouth, who, since his last conspiracy, had been pardoned, but ordered to depart the kingdom, had retired to Holland. He was received by the prince of Orange with the highest marks of distinction, and even became his chief favourite through whom all favours were to be obtained. When the news of Charles's death arrived, indeed, the prince made a show of altering his note, and dismissed Monmouth, though he still kept a close correspondence with him. The duke retired to Brussels, where, under the auspices of the prince of Orange, he resolved to invade England, with a design of seizing the crown for himself. He was seconded by the duke of Argyle, who formed the scheme of an insurrection in Scotland; and while Monmouth attempted to make a rising in the west of England, it was resolved that Argyle should also try his endeavours in the north. The generosity of the prince of Orange, however, did not correspond with the warmth of his professions. The unfortunate duke derived from his own plate and jewels his whole supply for the war; and the enthusiasm of a rich widow supplied Argyle with 10,000*l.* wherewith he purchased three vessels, which he loaded with arms and ammunition.

259
Mon-
mouth's
conspiracy.

Argyle was the first who landed in Scotland, where he published his manifestoes, put himself at the head of 2500 men, and strove to influence the people in his favour. But a formidable body of the king's forces coming against him, his army fell away; and he himself, after being wounded in attempting to escape, was taken prisoner by a peasant who found him standing up to the neck in water. He was from thence carried to Edinburgh, where after suffering many indignities he was publicly executed.

260
Defeat and
death of
Argyle.

By this time Monmouth had landed in Dorsetshire with scarce 100 followers. His name, however, was so popular, and so great was the hatred of the people to James on account of his religion, that in four days he had assembled a body of above 2000 men. They were indeed all of them the lowest of the people, and his declarations were suited entirely to their prejudices. He called the king the duke of York; and denominated him a traitor, a tyrant, a murderer, and a Popish usurper. He impated to him the fire of London, and even affirmed that he had poisoned the late king.

261
Monmouth
England.

Monmouth continued to make a rapid progress, and in a short time found himself at the head of 5000 men; but was daily obliged to dismiss great numbers for want of arms. The king was not a little alarmed at his invasion. Six regiments of British troops were called over from Holland; and a body of regulars, to the number of 3000, were sent, under the command of the earl of Feversham and Churchill, to check the pro-

gress.

Britain. grefs of the rebels. They took poft at Sedgemore, a village in the neighbourhood of Bridgewater, and were joined by confiderable numbers of the country militia. Here Monmouth refolved, by a desperate effort, to lofe his life, or gain the kingdom. He drove the royal infantry from their ground, and was on the point of gaining a complete victory, when the cowardice of Gray, who commanded the hoife, brought all to ruin. This nobleman fled at the firft onfet; and the rebels, being charged in flank, gave way after a three-hours conteft. About 300 were killed in the engagement, and 1000 in the purfuit. Monmouth fled above 20 miles from the field of battle, till his horfe funk under him. He then alighted; and, exchanging clothes with a shepherd, fled on foot, attended by a German count who had accompanied him from Holland. Being quite exhaufted with hunger and fatigue, they both lay down in a field, and covered themfelves with fern. The shepherd, being found in Monmouth's clothes by the purfuers, increafed the diligence of the fearch; and by the means of blood-hounds he was detected in his miferable fituation, with raw peafe in his pocket, on which he had lived for fome days. He burft into tears when feized by his enemies; and petitioned, with the moft abject fubmiffions, for his life. On his way to London, he wrote a fubmiffive letter to the king, promifing difcoveries, fhould he be admitted into his prefence. The curiofity of James being excited by the letter, he fent Sheldon a gentleman of the bed-chamber to meet Monmouth. In his converfation with Sheldon, he asked who was in chief confidence with the king; and being answered that it was Sunderland, Monmouth knocked his breaft in a furprife, and faid, "Why then, as I hope for falvation, he promifed to meet me." He defired Sheldon to inform the king, that feveral of his accomplices in rebellion were in the confidence of his majefty; and he gave him a particular account of the part which the prince of Orange had acted in this whole affair.

Sheldon, on his return from the duke of Monmouth, began to give an account to the king of what he had learned from the unhappy prifoner. Sunderland, pretending bufinefs, came into the room. Sheldon flopped, and fignified his defire to fpeak in private with the king. James told him he might fay any thing before that lord. Sheldon was in great perplexity; but being urged, he told all that Monmouth had afferted. Sunderland appeared, for fome time, confufed: at length he faid, with a laugh, "If that is all he can difcover to fave his life, he will derive little good from his information." Monmouth himfelf was foon after brought before the king. Sunderland by an artifice enured the death of the unfortunate duke, to fave himfelf and the other adherents of the prince of Orange. When he faw Monmouth's letter to James, and heard the difcoveries made by Sheldon, he is faid to have advifed him, that, as he could affure him of the certainty of a pardon, he ought to deny what he had faid in prejudice of his friends, who could ferve him on fome other more favourable occafion. The credulous duke, fwayed by the advice of Sunderland, fuppreffed what he had faid to Sheldon, when he was examined by the king. He mentioned nothing of the concern which the prince of Orange had taken in the invasion; though a point on which James was already fufficiently inform-

ed. D'Avaux, the French minifter to the States, had given a circumftantial account of the whole conduct of the prince to Louis XIV. who had ordered it to be privately communicated to the king of England. The minifter who had been fent from Holland to congratulate James on the fuppreffion of Argyle's rebellion, was in a grievous agony when he heard that the king was refolved to fee Monmouth. "Though he found that he faid nothing of his matter (faid James), he was never quiet till Monmouth was dead."

The unfortunate duke made various attempts to obtain mercy. He wrote to the queen dowager; he fent a letter to the reigning queen, as well as to the king himfelf. He begged his life, when admitted into his prefence, with a meanness unfuitable to his pretentions and high rank. But all his entreaties and fubmiffions were of no avail. James told him, that he was much affected with his misfortunes, but that his crime was too dangerous in its example to be left unpunifhed. In his laft moments he behaved with a magnanimity worthy of his former courage. When he came to the feafold, he behaved with decency and even with dignity. He fpoke little; he made no confeffion; nor did he accufe any of his friends. Circumftances are faid to have attended his death that created a horror among the fpectators. The executioner miffed his blow, and ftruck him flightly on the fhoulder. Monmouth raifed his head from the block, and looked him full in the face, as if reproaching him for his miflake. He ftruck him twice again, but with feeble ftrokes; and then threw the axe from his hands. The theriff forced him to renew his attempt; and the head of the duke, who feemed already dead, was at laft fervered from his body.

Those concerned in the duke of Monmouth's confpiracy were punifhed with the utmoft feverity. Immediately after the battle of Sedgemore, Feversham hanged up above 20 prifoners; and was proceeding in his executions, when the bifhop of Bath and Wells informed him that thefe unhappy men were now by law intitled to a trial, and that their execution would be deemed a real murder. Nineteen were put to death in the fame manner at Bridgewater, by colonel Kuke, a man of a favage and bloody difpofition. This vile fellow, praetifed in the arts of flander at Tangier, where he ferved in garrifon, took pleafure in committing inftances of wanton barbarity. He ravaged the whole country, without making any diftinction between friend and foe. His own regiment, for their peculiar barbarity, went under the ironical title of *Kuke's lads*. It doth not, however, appear that thefe cruelties were committed by the direction, or even with the approbation, of James; any more than the legal flughters that were committed by judge Jelleries, who was fent down to try the delinquents. The natural brutality of this man's temper was inflamed by continual intoxication. No fewer than 80 were executed by his orders at Dorcheffer; and on the whole, at Ex ter, Taunton, and Wells, 250 are computed to have fallen by the hand of juftice as it was called; nor were women exempted from the general feverity, but fuffered for harbouring their nearft kindred. Jelleries on his return was immediately created a peer, and foon after vefted with the dignity of chancellor. In juftice to the king, however, it muft be owned, that in his memoirs he complains, with apparent indignation, of "the

Britain. strange havoc made by Jefferies and Kirke in the west; and that he attributed the unpopularity, which afterwards deprived him of the crown, to the violence and barbarity of those pretended friends of his authority. He even ascribes their severities, in some degree, to a formed design of rendering his government odious to his subjects; and from hence it is probable, that no exact or impartial accounts of these cruelties had reached his ears, at least till long after they were committed.

²⁶⁷ James endeavours to establish Popery. James now began to throw off the mask, and to endeavour openly to establish Popery and arbitrary power. He told the house of commons, that the militia were found by experience to be of no use; that it was necessary to augment the standing army; and that he had employed a great many Catholic officers, in whose favour he had thought proper to dispense with the test required to be taken by all who were employed by the crown. He found them useful, he said, and he was determined to keep them employed. These stretches of power naturally led the lords and commons into some degree of opposition; but they soon acquiesced in the king's measures, and then the parliament was dissolved for their tardy compliance. This was happy for the nation; for it was perhaps impossible to pick out another house of commons that could be more ready to acquiesce in the measures of the crown; but the dissolution of this parliament was generally looked upon as a sign that James never intended to call another.

²⁶⁸ Parliament dissolved. The parliament being dismissed, James's next step was to secure a Catholic interest in the privy council. Accordingly four Catholic lords were admitted, viz. Powis, Arundel, Belasis, and Dover. Sunderland, who saw that the only way to gain preferment was by Popery, became a convert. Rocheller, the treasurer, was turned out of his office, because he refused to conform. Even in Ireland, where the duke of Ormond had long supported the royal cause, this nobleman was displaced as being a Protestant; and the lord Tyrconnel, a furious Roman-catholic, was placed in his stead. In his zeal for Popery, it is said, that James stooped so low as even to attempt the conversion of colonel Kirke: but the daring soldier told him, that he was pre-engaged; for he had promised the king of Morocco, when he was quartered at Tangiers, that, if ever he changed his religion, he would turn Mahometan.

²⁷⁰ English clergy oppose the court measures. At last the clergy of the church of England began to take the alarm, and commenced an opposition to court measures. The pulpits now thundered out against Popery; and it was urged, that it was more formidable from the support granted it by the king. It was in vain that James attempted to impose silence on these topics; instead of avoiding the controversy, the Protestant preachers pursued it with greater warmth.

To effect his designs, the king determined to revive the high commission court, which had formerly given the nation so much disgust, and which had been abolished for ever by act of parliament. An ecclesiastical commission was issued out anew, by which seven commissioners were invested with a full and unlimited authority over the whole church of England.—The next step was to allow a liberty of conscience to all sectaries; and he was taught, to believe that the truth of the Catholic

religion would then, upon a fair trial, gain the victory. In such a case, the same power that granted liberty of conscience might restrain it; and the Catholic religion alone be allowed to predominate. He therefore issued a declaration of general indulgence, and asserted that non-conformity to the established religion was no longer penal. In Scotland, he ordered his parliament to grant a toleration only to the Catholics, without interceding in the least for the other dissenters who were much more numerous. In Ireland, the Protestants were totally expelled from all offices of trust and profit, and Catholics put in their places. These measures sufficiently disgusted every part of the British empire; but to complete the work, James publicly sent the earl of Cattlemaine ambassador extraordinary to Rome, in order to express his obedience to the Pope, and reconcile his kingdoms to the Catholic communion. This proceeding was too precipitate to be relished even by the Pope himself; and therefore the only return he made to this embassy was the sending a nuncio into England. The nuncio made a public and solemn entry into Windsor; which did not fail to add to the general discontent; and because the duke of Somerset refused to attend the ceremony, he was dismissed from his employment of one of the lords of the bed-chamber.

Soon after this, the Jesuits were permitted to erect colleges in different parts of the kingdom, and to exercise the Catholic worship in the most public manner. Father Francis, a benedictine monk, was recommended by the king to the university of Cambridge, for the degree of master of arts. The university rejected him on account of his religion; and presented a petition to the king, beseeching him to recal his mandate. James disregarded their petition, and denied their deputies a hearing; the vice-chancellor himself was summoned to appear before the high commission court, and deprived of his office: yet the university persisted, and father Francis was refused. The place of president of Magdalen college being vacant, the king sent a mandate in favour of one Farmer, a new convert, and a man of bad character in other respects. The fellows of the college made very submissive applications for recalling his mandate; but the election day coming on before they received an answer, they chose Dr Hough, a man of learning, integrity, and resolution. The king was incensed at their presumption; an inferior ecclesiastical court was sent down, who finding Farmer a man of scandalous character, issued a mandate for a new election. The man now recommended by the king was doctor Parker; a man of an abandoned character, but very willing to embrace the Catholic religion. The fellows refused to comply with this injunction; which so irritated the king, that he came down to Oxford in person, and ordered the fellows to be brought before him. He reproached them with their insolence and disobedience; and commanded them to choose Parker without delay. Another refusal on their side served still more to exasperate him; and finding them resolute in the defence of their privileges, he ejected them all except two from their benefices, and Parker was put in possession of the place. Upon this, the college was filled with Catholics; and Charnock, one of the two that remained, was made vice-president.

In 1688, a second declaration for liberty of conscience

*Britain.*²⁷¹ James sends an ambassador to Rome.²⁷² Dispute with the university of Cambridge.²⁷³ College filled with Catholics.
